He pursues the topical method, which, whatever objections may legitimately be raised to it, has three great advantages —continuity, clearness, and possible brevity. These more than compensate for the loss of contemporaneousness. Thus he opens with two chapters on the late mediæval ideals of chivalrous and celestial love, in which there is much sound sense. Then he takes up the "real woman" and describes her at every age and in all her family and social relations. He takes up the customs pertaining to betrothal, marriage, death and burial, the perils and amusements, the dress, the superstitions, the pieties, and the morals. He touches on her legal status, her efforts toward greater freedom, her gains in economic independence. He treats in one section of beatified women and nuns, and in another of courtesans—the two extremes in his survey.

From first to last, we discover no attempt on the author's part to stretch his facts to fit any theories. He states each case simply, with a straightforward charm, and leaves his readers to draw their own conclusions; or, where he himself sums up a topic, he does so without heat or perversion. In the main, his verdict is cheering: for he shows that the position of woman constantly improved, though slowly or intermittently, and that with her ascent society advanced—that is, the lot of the average human being was a little brighter.

The value of Mr. Boulting's researches lies in the fact that they are his own. He has not merely pilfered Burckhardt, Villari, Symonds, and the rest, but has gone to the sources himself. The result is that he has gathered much evidence which will be fresh to English readers. But in appraising works of this kind the final question is, how far are the pieces of evidence representative? Should we maintain that posterity could judge us fairly if our times were remembered by only a single issue of a yellow journal? Is the case of cruelty or of immorality or of piety, which happens to have survived in some musty document, typical of the community and time in which it occurred? or is it exceptional? Mr. Boulting seems to us to possess that instinct for the typical without which it is a waste of time to labor in the quarries of *Kulturgeschichte;* and this it is which makes his extensive researches fruitful, this and his talent for setting forth his results in an attractive style. The general reader will read him with much entertainment; the specialist will recognize how solid and valuable his studies are. Such a book, we may remark in closing, ought to be of service incidentally in throwing light on the burning issue of woman's political destiny.

Notes

Our readers will be pleased to learn that the novels of George Gissing, many of which have been scarcely procurable, at least in any edition of reasonable price, are to be reissued. They are promised by the English firm, Sidgwick & Jackson.

The same house announces "The Glory that Was Greece," an account of the ancient Hellenic civilization, by J. C. Stobart.

John W. Luce & Co., who plan to bring out the works of J. M. Synge, the Irish poet and dramatist, promise four volumes in March, which include "The Aran Islands," with twelve illustrations by Jack Yeats, and "Kerry and Wicklow."

This spring the Putnams will publish: "Anglo-American Memories," by George W. Smalley; "The Republican Tradition in Europe," by H. A. L. Fisher; "Fifteen Thousand Miles by Stage," by Carrie Adell Strahorn," and "John Murray's Landfall," by Henry Nehemiah Dodge.

The first number of a new quarterly publication, the *American Labor Legislation Review*, has been issued by the American Association for Labor Legislation. It contains a paper on "Practical Methods in Labor Legislation," by Henry W. Farnam; Alice Hamilton of Hull House writes on "Lead Poisoning" as one of the occupational diseases; Sidney I. Schwab discusses "Neurasthenia in Garment Workers," and (not to mention all the papers) a "Memorial on Occupational Diseases" is prepared by Henry Baird Favill and others, who attempt to show that every year $772,892,860 is lost to society because of sickness due to occupations; a large part of this sickness, they contend, could be avoided.

"The War Maker," which is to be brought out this spring by A. C. McClurg & Co., is the life story, taken down by Horace Smith exactly as it was related, of that extraordinary soldier of fortune, Capt. George Boynton, who died last January in this city.

McClurg & Co. also announce "From Rough Rider to President," a new biography originally written in German by Dr. Max Kullnick and translated by Prof. Frederick von Rietdorf; "Gettysburg: The Pivotal Battle of the Civil War," by R. K. Beacham; "French Men, Women, and Books," by Miss Betham-Edward; "Frederick Nietzsche: The Dionysian Spirit of the Age," by A. R. Orage; "The Humbler Poets," by Wallace and Frances Rice; "The Lawrence Reader and Speaker," by Prof. E. G. Lawrence; "The Soul of a Flower," by Sara A. Hubbard; "My Friend Will," by Charles F. Lummis, and "The Gold Fish of Gran Chimu," by the same author.

Spring books of Doubleday, Page & Co. include: "Margery," by E. F. Benson; "Reminiscences of Gen. Basil W. Duke" of the Confederate army; "Music of the Wild," by Gene Stratton-Porter; "The Southerner," by Walter H. Page, being the autobiography of Nicholas Worth, new edition; "Two on the Trail," by Hulbert Footner; "Life and Letters of Moses Coit Tyler," by Jessica Tyler Smith; "Life of Andrew Jackson," by Prof. J. S. Bassett; "A Comedy of Circumstances," by Emma Gavf; "The Vanity Box," by Alice Stuyvesant; "Chapters from My Experience," by Booker T. Washington; "Fenella," by Henry L. Stuart; "The Harvester," by Gene Stratton-Porter; "The Coward of Thermopylæ," by Caroline Dale Snedeker; "The Cabin," by Stewart Edward White, and "One Hundred Masterpieces," by John La Farge.

Houghton Mifflin Co. has in the press Mary Johnston's new novel, "The Long Roll."

The Rev. Thomas J. Campbell, editor of *America*, will publish shortly the third volume of his "Pioneer Priests of North America."

The announcements of Henry Holt & Co. include: Henri Bergson's "Creative Evolution," translated by Arthur Mitchell; "The Gleam," by Helen R. Albee; "The Influences of Geographic Environment," by Ellen Churchill Semple; "Letters that Live," selected by Laura E. Lockwood and Amy R. Kelly; "A Philadelphia Lawyer in the London Courts," by Thomas Leaming, and "The Quietness of Dick," a story of two boys by R. E. Vernede.

Among the new books for Lent in the list of Thomas Whittaker are: "The Longer Lent," by the Rev. V. R. Lennard; "Common Failings," by the Rev. J. H. Williams; "Sign Posts in the Way," by the Rev. L. M. Dalton, and "The Women of the Passion," by the Rev. T. W. Crafer.

New books, to be brought out by Dent, include: "Adam Mickiewicz, the National Poet of Poland," by Monica M. Gardner; "The Coast Scenery of North Devon," by E. A. Newall Arber; "Sinai in Spring," by M. J. Rendall; "Historical Guide to London," by G. R. S. Taylor, and "International Law," by F. E. Smith.

Henri de Régnier, who has been elected to the French Academy to succeed the Viscount Melchior de Vogüé, is a novelist, a writer of verse, and a dramatic critic.

The *Annales de Géographie* for January contains an interesting sketch, with three charts, of the history of the cotton industry in the region about Rouen, which, during the past century, has suffered a great change. The woman worker to-day earns more than the man, a fact which has resulted in "the destruction of the family hearth, the multiplication of public-houses, and the development of alcoholism." Other articles are on the glacial erosion and formation of the Alpine valleys, and the satisfactory economical condition of French Indo-China, as indicated in a recent address of the governor-general.

Spenser's "Faerie Queene" is not without its "catalogue of the ships," in the form of a versified chronicle, divided into two parts, of the kings of Britain, the ancestors of his "soveraine Queene," Elizabeth. The age, as Lowell said, imposes on its poet the task of weaving its straw into a golden tissue. But in this instance, according to the careful investigations of Miss Carrie Anna Harper ("The Sources of the British Chronicle History in Spenser's Faerie Queene," Bryn Mawr College Monographs, vii), the witch imagination did not step in and achieve the miracle. Spenser, who invents mythology at will, and who usually rearranges and embellishes his sources with the greatest imaginative freedom, here writes in the spirit of an antiquarian chronicler. He does not, however, base his account of the kings from Brutus to Cadwallader on any single source; depending, apparently, on Geoffrey of Monmouth for the main outlines, he often in a single passage characteristically draws on a number of other authorities: Holinshed, Hardyng, Camden, "The Mirror for Magistrates," "Gorboduc," and so on. Chapter and verse can be cited for nearly every one of his statements. It is difficult to divine the motives which guided Spenser in the choice of his material for this carefully composed mosaic. His insistence on the British, as opposed to the Roman or Saxon, point of view, and the interest in Welsh tradition grow out of a desire, probably, to compliment Elizabeth's Welsh blood. The suggestion is offered, too, that Spenser may in his youth have intended an independent poem based on chronicle history, the widely gathered materials for which he later worked into the fabric of the "Faerie Queene." This hypothesis, quite in accord with Spenser's known practices, would partly explain the present condition of the material.

"Balzac—A Biography" (Wessels & Bissell), by Frederick Lawton, inclines to picturesque incident rather than to literary judgment. Numerous portraits and caricatures, dating from all periods of Balzac's life, accompany the account of a career which seems itself a caricature. Balzac was an irresponsible, like the elder Dumas. He was not, however, the effulgent quadroon, lavish in manner and burly in size, but embodied an equal amount of improvident and gorgeous schemes and of colossal egotism in his diminutive stature of five feet two. As we read of Balzac's plans for making a fortune as a printer, for bringing wood from Poland at a cost greater than the value of the wood, for extracting silver from slag in Sardinia, and of his impractical house built without a staircase, we realize the irrational and romantic temperament of this so-called "father of realism." Mr. Lawton has appropriately emphasized more than the biographers generally do the strong element of occultism running through many of Balzac's writings, which often made his psychology a mixture of transcendentalism and of the physiology of Gall and Broussais. He also shows the importance of neglected influences upon Balzac's early writings, from C. R. Maturin and the English School of Terror, and from Ducray-Duminil, biographer of the "enfant du mystère" and the "enfant de la forêt," to Scott and James Fenimore Cooper. Much space is devoted to the relations of Balzac and the *étrangère*, Mme. Hanska, who fell in love with him through his writings, as has happened more than once in literature from the days of Guillaume de Machault and Péronnelle d'Armentières in the fourteenth century down to the present time, and who finally married, just before his death, a man broken down by disease and burdened with financial liabilities. Mr. Lawton has conscientiously analyzed Balzac's chief novels, and tells the circumstances of their composition. The effect produced is, however, rather one of piecemeal incident than of general classification or criticism. The works are chronologically placed in Balzac's life, he himself is not so clearly placed in French literature. Hence the book, though interesting, cannot be called a final study of Balzac. The author also makes some questionable affirmations. Did Napoleon I introduce gas into Paris? Was the theme of the courtesan in love a favorite one with the classical school? Is "A Shady Affair" a good translation for "Une ténébreuse affaire?"

"Corporation Finance" (Appleton), by Edward S. Meade, is an extension on the technical side of the author's well-known book on "Trust Finance." It is a discussion of corporation practice, and attempts no contribution to the solution of the corporation problem. Its purpose as a college text-book has determined its method of treatment. It proceeds naturally and logically from the organization of the corporation, through promotion and underwriting, to the company as a going concern. Such problems of corporate management are then considered as the determination of profits, the handling of depreciation, the payment of dividends, the distribution of surplus, and the provision of new capital. Under the last topic the various forms of securities employed are critically studied. Methods of corporate consolidation are next discussed, including the merger, the holding company, and the lease. The concluding chapters are devoted to receiverships and reorganizations. The book reveals a sure grasp of the fundamental principles of sound finance, and a first-hand familiarity with the current practice of railways and industrial companies. The author permits himself little expression of personal views, except as these reveal themselves incidentally in the discussion of financial principles—for instance, in his severe criticism of the capitalization by the Chicago and Alton of a fictitious surplus—but such explicit opinions as he occasionally expresses must commend themselves as thoroughly sound. For example, he ventures the prediction that the final solution of the problem of overcapitalization will be found in a limitation of security issues, especially by public service corporations, to the cash cost or fair value of property constructed or purchased, such value to be determined by some disinterested public authority. In his opinion, this method should not interfere with the development of any legitimate enterprise. He discusses briefly the present method of control of capitalization by public service corporations, and commends such control as giving greater security to investments. The book is a lucid and able exposition of financial practice.

The prevailing fashion of mingling history and fiction is strikingly exemplified by "Bess of Hardwick, and Her Circle" (Lane), by Maud Stepney Rawson, in which the life of one of the most famous of Tudor termagants is exhibited in a bewildering maze of original letters, biographical narrative, and frankly imaginary dialogues and interludes. Mrs. Rawson freely confesses in her preface that she has "needed consolation at times for certain hard and

bitter facts of history" and has therefore permitted herself to make "brief incursions into fiction." This frankness is wholly admirable, but it unfortunately precludes the possibility of judging what she calls her "first essay in history" as such. And one cannot help wondering what the "hard and bitter facts of history" for which Mrs. Rawson needed consolation were. Surely she cannot complain that the biography she has selected is lacking in excitement, romance, scandal, or any other of the qualities which attract popular attention in these degenerate days. The life of "Bess of Hardwick" typifies everything which a stormy and tempestuous career in Tudor times might be expected to bring forth. Four times wedded, to husbands of widely different characters and stations in life, she devoted herself first and foremost to securing the worldly welfare of the children of her second marriage; and she became the grandmother of Arabella Stuart, and the foundress of the fortunes of the house of Devonshire. Indefatigable as a builder, closely associated with the career of Mary Queen of Scots, whose jailor, the Earl of Shrewsbury, was her fourth husband, an object of suspicion to Queen Elizabeth, and on one occasion even a prisoner in the Tower of London, her life is surely not surpassed in violent contrasts and dramatic interest by that of any of the many ambitious female dynasts in which sixteenth-century history abounds.

The eagerly awaited "American Year Book for 1910" bears out the promises of its projectors. Published by Appleton & Company, who for years stood behind a valuable annual cyclopædia, it is evident that this work, if carried on in the same spirit as at present, must take a prominent place beside such invaluable publications as the Statesman's Year Book, Hazlet's Annual, etc. The "American Year Book" undertakes to be "a record of events and progress." It has been edited by Dr. S. N. D. North under the direction of a supervisory board representing national and learned societies, the association of which in a project designed to be of value to all is, as the preface states, a new departure in this country. The moving spirit in the enterprise has been Prof. Albert Bushnell Hart of Harvard, and with him are associated such men as Hastings H. Hart, William M. Davis, George H. Kirchwey, Alexander Lambert, Calvin W. Rice, and John C. Rolfe, who form the executive committee of the advisory board. The book is arranged in thirty-five departments, and there are ninety-two contributors to this first issue, all of them experts in their field. The first two sections comprise international and national statistics of trade and mercantile and mining production, birth rates, etc. The history of the United States in 1910 is treated by Professor Hart with a generous hand, and in exceptionally readable though compressed form. Each department is followed by a brief bibliography of the subject. For instance, under international relations the movement for arbitration and peace is treated in eight pages, with a bibliography of all the important articles on the peace movement, arbitration, the court of arbitral justice, and the Hague Tribunal which have appeared during the year. There is even a record of the Carnegie peace fund and its trustees, although the announcement of it was not made until December 14, 1910. The national administration is treated at length, with complete directory of the Senate, the House, the Diplomatic consular services, etc.; and there is interesting addition to this in an article by Clinton Rogers Woodruff on the civil service and civil pensions. Prof. John A. Fairlie contributes the story of the progress of State and county governments. Whoever desires to follow such recent developments in government as the latest city charters and the progress of the commission form of government will find full details here.

In brief, every field of general interest has been thoroughly and carefully covered even to such matters as theatres and museums, with the latest motor vehicle laws, and always in the scientific spirit to be expected of the men responsible for the publication. Not unnaturally there are some marks of hasty compilation, as was to be expected with the first volume. Sometimes the editors err in matters of proportion. For instance, two and a half pages are given to Mr. Roosevelt's activities in the last campaign, while Gov. Wilson's contest in New Jersey, one of the most enlightening and stimulating the country has witnessed in decades, is dismissed with the briefest mention. In the story of political corruption in New York, it would appear from this record that Senator Allds resigned after the Senate on March 29 last voted that the charges against him were sustained. As a matter of fact, he resigned before the Senate voted. Again, we notice a slight slip in the statement (p. 58) that Mayor Gaynor "reorganized the Commission on the Catskill water supply because of what he thought excessive waste for land damages." It was not the Board of Water Supply, as some might think from this, that he reorganized, but the old virtually inactive Aqueduct Commission which has nothing to do with the Catskill water supply. But these are slips to be expected in consideration of the newness of the venture and the lack of time, and they do not mar the value of the work as a whole.

Mrs. Maud Howe Elliott's "Sicily in Shadow and in Sun" (Little, Brown & Co.) describes the earthquake of 1908 and the American relief work. It is written with the vividness of one who knew the persons engaged in that work, and who visited the scenes themselves. Interviews, conversations, and pictures (these last from sketches and photographs made by Mr. Elliott) combine to produce an indelible impression. As a foil to the tragedy, Mrs. Elliott adds an account of a sight-seeing trip to Syracuse and Palermo. She is an enthusiastic traveller; keen-eyed, good-natured, quick-witted. Among the episodes she touches on is the murder of Petrosino.

Ezra Pound, having "floundered somewhat ineffectually through the slough of philology" and read with enthusiasm a considerable amount of the poetry of the Latin countries, records his likings in "The Spirit of Romance" (Dutton). The book consists of a series of translations, some borrowed, some original, together with a few bits of information and some appreciative comment. The original translations, in prose arranged as verse, are intended to be "merely exegetic." Their success may be judged from

Yea, he betrays our faith who creeds not her,

as a rendering for the line,

E fa 'l di nostra fè se non la crede,

in which Guinizelli is claiming for his lady the power to convert a heretic by her mere greeting. It is to Guinizelli that Mr. Pound attributes the invention of the sonnet. The few hits of really good comment are too rare to be worth hunting for. The book purports to be "an attempt to define somewhat the charm of the pre-Renaissance literature of Latin Europe," but does not bear a trace of synthetic criticism of any sort; and the spirit of romance appears only in the title, unless it is responsible for the statement in the "præfatio ad lectorem electum" that the "Grundriss von Grüber" "consists of 21,000 folio pages." But much may be forgiven Mr. Pound, in view of the definition enshrined in this same preface: "Art is a fluid moving above or over the minds of men."

It is unfortunate for William O'Brien that his new Irish party should have suffered so great a defeat just after he had put out to an unsympathetic world his "Olive Branch in Ireland" (Macmillan). That party was to come back to the House of Commons from the general election more than doubled in numbers, and strong in the consciousness that, while as yet only a growing minority, it represented the nation of Ireland far more adequately than did the so-called National party; in reality it returned shorn of more than one-fourth its members. Mr. O'Brien himself, who contested three seats, was overwhelmingly defeated in two of them—in West Mayo, a constituency, the careful cherishing of which he describes in his book, and in one of the divisions of Cork, a city whose enthusiasm for the new party and its leader he has not words enough to describe. In view of this popular discrediting of Mr. O'Brien's movement, the prophecies and portents of "The Olive Branch" can attract little attention and command little credence. To make his cause still less promising, the author has not the art of strong presentation. His style is turgid and verbose. He seems to be under the impression that his readers are already well acquainted with every incident and event in Irish party history for the past twenty years; without filling in the background, he furnishes jauntily the solutions of all the puzzles.

Had O'Brien's counsels been followed in every crisis, there would have been nothing but harmony and prosperity in Ireland—Irish tenants, all owners of fertile and productive holdings; Irish landlords happily rid of the cares of rent collecting, enjoying large and steady incomes from the investment of their purchase money, and taking an active and benevolent interest in local government; and a wise Irish Parliament on College Green. Unfortunately, Mr. O'Brien's advice was rarely heeded. On one point Mr. O'Brien is to be congratulated. The recent setback to his party and his defeats in West Mayo and East Cork may assuredly be accepted by him as a release from the painful duty of political leadership which has pressed so heavily on him. Again and again he assures his readers that sitting in Parliament is a penance—an experience to which six months in Galway gaol is infinitely preferable.

It is significant, not so much of the moral degeneracy, as of the intellectual status, of our people, that such a book should be written as Prof. Robert C. Brooks's "Corruption in American Politics and Life" (Dodd, Mead & Co.). As the author makes very plain, corruption is a "persistent problem," and is as old as organized society. But the writing of a scientific treatise on it is distinctly a twentieth century project. In order to clear the way for the discussion of corruption as a true evil, Mr. Brooks first takes up the common apologies for corruption, and proves them, in turn, to be inadequate and fallacious. His conception of corruption is broader than that which ordinarily prevails, as is evident from his definition: "The intentional misperformance or neglect of a recognized duty, or the unwarranted exercise of power, with the motive of getting some advantage more or less directly personal." This definition is clarified by the distinction between bribery and "auto-corruption," and it would be a complacent man, indeed, who could read the book through thoughtfully, and find himself wholly free from taint of corruption. The evil is shown to infect, not only politics, but every form of human activity. The author admits the difficulty of measuring the degree of corruption existent in any society. Great clamor and sensational exposures do not always portend a low state of social morality, but possibly the reverse. A wide dissemination of political opportunity and responsibility among the common people opens many doors of temptation to abuse. The author believes that corruption in civilized states is on the decline, and sees hope for the future in many practical movements, as the short ballot, publicity in corporation and official accounts, and in campaign contributions, in positive moral reforms and general moral education.

Léon Vallée of the Bibliothèque Nationale, Paris, is reprinting his "Bibliographie des bibliographies" (Terquem; each volume 25 francs, plus supplement 15 francs). It comprises, first, a catalogue of general and particular bibliographies in the order of authors, with complete indications of titles, form, place, and date of publication; secondly, a repertory of the same, in the order of subjects—as originally published in 1887.

"Orphéus et l'Evangile" (Paris: Gabalda), by Monsigneur Batiffol, who has been identified with Catholic University teaching in France, owes its name and nature to the "Orpheus" of Salomon Reinach. It deals with the latter's chapter on Christian origins; but it is rather an introduction to New Testament criticism than a formal refutation, and serves as a preface to the author's "Teaching of Jesus." He acknowledges that, as a believer, he considers M. Reinach's book an "aggression"; and, in his frequent use of Harnack's writings, he is careful to note "regressions" to Catholic tradition. The style and composition of the book, which was delivered first in the form of lectures, have all the merits of French writing, while the erudition of its author has been accepted by the Anglican *Guardian* as placing him in the first rank of writers, who unite theology with exegesis or, as we used to say, reconcile faith with science.

James McKeen, one of the leaders of the New York bar and a writer on legal and national topics, died last week, aged sixty-six. He graduated from Bowdoin and from the Columbia Law School; served in important public capacities, and, besides various articles, wrote the two books: "Evolution of Penal Methods and Institutions" and "Factors in American Civilization."

The death is reported from London, in his eighty-seventh year, of John Dennis, the author of "Studies in English Literature," "Heroes of Literature: English Poets," "The Age of Pope," etc.

Friedrich Spielhagen, who ranked among the best of the old-school novelists, died in Berlin last Friday. His descriptions of the period of 1848 were notable. He was born in Magdeburg in 1829, and began his active life as a teacher at Leipzig. In 1859 he became editor of the *Zeitung für Norddeutschland,* in Hanover. In 1862 he moved to Berlin, and for several years was editor of Westermann's *Illustrirte Monatshefte.* In the meantime, he had begun novel writing, in 1860, with "Problematische Naturen," his works dealing for some time with social problems. His collected novels appeared in twenty-two volumes in 1895. Among them are: "Durch Nacht zum Licht," "Die von Hohenstein," "In Reih und Glied," "Hammer und Ambos," "Sturmflut," "Ein neuer Pharao," and "Freigeboren." His own ideal for the novel was to present an artistically composed picture of the times, and his writings abound with thinly veiled allusions to persons of contemporary prominence. He did some critical writing, made several noteworthy translations, and left not a little verse.

Sam Walter Foss, poet and lecturer, died at the Charles Gate Hospital in Cambridge, Mass., on Saturday. He was born in Candia, N. H., in 1858, and graduated from Brown University in 1882. In 1887 he became editor of the *Yankee Blade* a popular literary weekly published in Boston. This position he held for five years, resigning it in 1892 for the risks and rewards of general authorship. He became, in 1898, librarian of the Somerville Public Library. His works include the following: "Back Country Poems," "Whiffs from Wild Meadows," "Dreams in Homespun," "Songs of War and Peace," and "Songs of the Average Man."

Science

"Public Hygiene," by Dr. Thomas S. Blair, will be issued simultaneously by Rebman in England and by Badger in this country.

"The Practical Country Gentleman," by Edward K. Parkinson, is to be published immediately by A. C. McClurg & Co., who also promise "The Psychology of Faith and Fear," by Dr. W. S. Sadler; "Nature Sketches in Temperate America," by Dr. Joseph L. Hancock; "Cone-Bearing Trees of the California Mountains," by J. Smeaton Chase, and "Half Hours with the Summer Stars," by Mary Proctor.

Among the science books from the press of Doubleday, Page & Co. are: "Vines, and How to Grow Them," by William McCollom; "Chrysanthemums, and How to Grow Them," by I. M. Powell; "Garden Planning," by W. S. Rogers; "Household Plumbing and Sanitation," by J. Pickering Putnam; "What England Can Teach Us About Gardening," by Wilhelm Miller, and "The Forester's Manual," by Ernest Thompson Seton.

Ambassador Hill will present the Cullum gold medal of the American Geographical Society to Prof. Hermann Wagner of the University of Göttingen on March 5, in recognition of his achievements in geography. The presentation will be followed by a reception at which many German scholars will be present.

British Empire cotton-growing is the subject of an article by J. H. Reed in the current *Geographical Journal.* In consequence of the regular and progressive shortage of cotton, which, if not checked, will doom the great staple trade of Lancashire, an association was formed eight years ago for the fostering and development of this industry in the British colonies. Its work has been first the study of the different regions to find the best variety of plant for each, then to establish experimental farms, distribute seed, erect ginneries, and in every way to interest and instruct the natives. Recently they have decided to concentrate their main efforts on Nigeria, Uganda, Nyasaland, and the West Indies. The results in Nyasaland have been eminently satisfactory, the value of exports of cotton fibre having risen from $15 in 1903 to above $140,000 in 1908, and at present about 20,000 acres are under cultivation by Europeans. Taking into consideration the growing interest in the industry in Uganda and Nigeria, there can be little doubt of the truth of the assertion that "the dark Continent is the hope of Lancashire."

Dr. E. Davenport, the author of "Domesticated Animals and Plants" (Ginn), is dean of the College of Agriculture in the University of Illinois, and director of the Agricultural Experiment Station. He is also professor of thremmatology, which is the science of breeding animals and plants under domestication, and which, though it has only of late obtained great prominence as a separate branch of study, occupies one of the most important fields of research. It will surprise a majority of our readers to learn how rapid and extensive has been the development of this department of investigation during the last ten years. In many of our institutions of learning there are specialists who are now devoting all their time to the study of the principles which underlie the "breeding-to-points" of our agricultural plants and animals. It is not too early to receive from the hands of one of these specialists a brief summary of the chief facts involved. The experiment station at Urbana has taken a prominent part in the study of the subject, and it is quite proper that the director should indicate some of the results. Although the treatise has been prepared with a view to its use as a text-book, it is readable and interesting. The general reader can find in the work a great deal which it is well worth his while to examine, while the progressive farmer can obtain from it very valuable hints as to the definite improvement of his own plants and stock. We cannot agree with quite all of the author's statements as to the origin and history of some of our cultivated crops, but such comparatively minor matters do not impair the value of the work.

Dr. George T. Stevens's "An Illustrated

Guide to the Flowering Plants of the Middle Atlantic and the New England Statcs" (Dodd, Mead), with more than 1,800 illustrations from drawings by the author, is a work in which there are many errors of omission and of commission, but which is sure to be of use to many persons. In most cases the faults are trivial and are not likely to mislead beginners seriously. In some ways the work reminds us of a popular treatise on the plants of Boston and vicinity, which was prepared a great many years ago by a physician in active practice. That volume contained numerous errors, but it was written in an attractive style, which led many people, young and old, to examine the plants of the neighborhood. One of the most exact botanical students living within the range of the flora just referred to, expressed surprise that so busy a practitioner of medicine could have prepared a botanical work having so few serious imperfections. Dr. Stevens, also a practitioner of medicine, has done this by making botany a serious avocation. One could wish that the nomenclature had been put on a more consistent basis; but names are, after all, rather unimportant matters for amateurs. Sometimes it seems as if the French method of giving greater prominence to so-called common names would be well worth trying in our own country. The main difficulty would arise, in the case of our native plants, from the lack of common names which are generally accepted. Dr. Stevens has been successful in a large proportion of his illustrations, and most beginners will find them useful.

Drama

Daniel Frohman has placed with Doubleday, Page & Co. his "Memories of a Manager," which begins with the early days of the Lyceum Theatre in 1886, and includes the chapter, Why Plays Fail.

The same house is bringing out "The Immortal Lure," a collection of four plays by Cale Young Rice.

The New Theatre is fulfilling its proper functions when it produces a play like "The Arrow-Maker" of Mrs. Mary Austin, which was presented there on Monday evening. This is not in any sense, either literary or dramatic, a great drama, but it is distinctively American in subject and atmosphere, employs competent knowledge to reproduce the manners and customs of a picturesque and obsolete barbarism, and tells an interesting, if not very exciting, story. Doubtless the play is more valuable in its archæological and anthropological than upon its purely dramatic and human side—Mrs. Austin not being an inspired poet or dramatist—but the incidents are well fitted to the characteristic details. The heroine is the Chisera, a high priestess vowed to celibacy in order that she may hold closer converse with the gods. But she loves the ambitious and faithless Simwa, and uses all her arts, including fraud, to further his ambition, until she learns that he has thrown her over to marry the daughter of his chief; whereupon she publicly denounces him, and refuses longer to "make medicine" for the tribe. Soon Simwa, deprived of her assistance, leads the warriors to defeat, and the tribe is reduced to the last extremity. The Chisera, broken-hearted by the treatment she has endured, says that she has neither the will nor the power to help them. But, childless herself, she resolves to gratify her maternal instincts by ministering to the children of others, and in this mood she recovers her former energy and powers, and is once more able to make the necessary incantations. The curtain falls upon the deposition of Simwa and the departure of the surviving warriors to assured victory. The experience of the Chisera is supposed to have some symbolical application to that of the modern woman, but the parallelism is not obvious or important. "The Arrow-Maker" is significant only as a praiseworthy attempt at an American Indian play, with an object beyond that of mere entertainment. It has been mounted at the New Theatre with learning, liberality, and taste, and some rare acting is furnished by Edith Wynne Matthison.

English papers are commenting on the feat of Princess Bariatinsky, who, after only a year's study of English, impersonated acceptably at the Royalty Theatre the part of Nora in "A Doll's House."

Miss Horniman and her Manchester company have been playing "The Knight of the Burning Pestle" at the Coronet Theatre in London. The London *Times* says: "There is no doubt that Miss Horniman's company has thoroughly entered into the spirit of the play."

H. B. Irving, his wife (Dorothy Baird), and company will leave London in May for a professional tour in Australia.

Oscar Asche revived "The Merry Wives of Windsor" in the Garrick Theatre, London, last Saturday, himself resuming the part of Falstaff. Lily Brayton, of course, was the Mistress Ford.

Most of the London critics are agreed as to the extraordinary quality of the acting of Ethel Irving in Mr. Mason's new play, "The Witness for the Defence." One of the best of them says: "I should not like to say how much is due to Miss Irving. To me it seemed that any lesser genius would have rendered it all tawdry."

The plan for a Shakespearean Memorial Theatre in London seems to assume a more tangible form, when the promoters make formal applications for a site. They have just submitted a petition, bearing the names of many men eminent in literature and art, in which the council is requested to give the proposed National Theatre an option upon the office which it occupies at present in Spring Gardens. The council itself is about to vacate these premises and remove to the magnificent new structure awaiting it on the Thames Embankment. The theatre folk do not ask for a free gift of the Spring Gardens site, but only that they may be permitted to obtain an option upon it on favorable terms. The matter has been referred to the proper committee. The following is one passage in the petition:

We have the utmost confidence that such an act of grace on the part of the council will be supported by public opinion throughout London and the country. The drama presented at the National Theatre would be a powerful instrument for the public good, alike for its educational value and artistic influence. London owes a debt to the memory and greatness of Shakespeare. The Memorial Theatre erected on this site would be a worthy addition to the state buildings of the neighborhood, as well as a monument, appropriately placed, to the greatest of Englishmen.

J. E. Vedrenne and Dennis Eadie have completed arrangements by which they will go into theatrical management together. They have procured a West End theatre in London, which they will open just after Easter. There will be no attempt at a repertory system, although a special series of regular matinées will be given, with plays different from that in the evening bill. A number of pieces have already been procured, and the first production will be a new play by Jerome K. Jerome.

Music

VICTOR HERBERT'S "NATOMA."

When the dual management of the Metropolitan Opera House was ended and Andreas Dippel went to Chicago, the impression prevailed that he had been worsted, as, indeed, he had in so far as he would doubtless have preferred to be sole manager of the New York opera. But inasmuch as the indispensable Toscanini would have refused to remain unless the manager with whom he had come from Milan was reengaged, no other solution was possible; and, after all, Mr. Dippel's new opportunities offered great scope to his ambitions. He gave Chicago a successful opera season and then transferred his forces to Philadelphia. There his company was at first received in a lukewarm manner, even though he had changed its name to "Philadelphia-Chicago Opera Company." But when the Philadelphians found the performances given by Dippel's artists in New York on Tuesday evening attracted exceptionally large and brilliant audiences and won the unanimous praise of the press, they repented and began to patronize the singers from Chicago, who, in the consulship of Oscar Hammerstein, had been partly their own.

As the best of the Hammerstein-Dippel singers are with few exceptions of the French school, it was inevitable that Mr. Dippel should continue to favor the French operas Hammerstein had made popular. Thus it happened that "Thaïs," "Louise," "Pelléas et Mélisande," and "Carmen" were produced on the first four of the Dippel Tuesdays at the Metropolitan. This week, however, there was a complete change—an American grand opera by Victor Herbert which is also a legacy from Hammerstein, by whom it had been ordered. It had its first hearing in Philadelphia last Saturday, and there is a disposition to greet it as the first real grand opera written in America. A more opportune time for its production could not have been chosen; for it was, of course, sung in English, and there has been a great deal of clamor of late for opera in English,

some prominent artists and critics going so far as to demand that all the Italian, French, and German operas produced at the Metropolitan should be translated and sung in the language of our country, just as all operas are sung in Italian in Milan, in French in Paris, in German in Berlin. These enthusiasts forget that, as Wagner has attested, it is almost impossible to make a satisfactory version of an opera book into another tongue; they forget also that if all operas are sung in many European cities in the language of their country, this is a necessity, not a virtue; and that if the Berliners or Parisians could afford to have a triple company, like that of our Metropolitan, which has each opera sung in its original language, they would greatly prefer our arrangement to theirs.

On the other hand, one cannot agree with those who hold that English is a less "singable" language than Italian, French, or German. Rousseau held the opinion that French was not suitable for music till Gluck convinced him he was mistaken. The oratorios of Handel, the operas of Purcell, Stanford, and Gilbert and Sullivan afford abundant proof that English and song can be made to go together smoothly; and Victor Herbert has shown the same thing in his stage-works, which have gone far toward establishing a real American school of operetta. The question now is, has he actually given us, in his "Natoma," the first genuine American grand opera?

The story on which it is based is American in the most comprehensive sense of the word. Naturally, Mr. Herbert and his librettist, Joseph D. Redding, had no use for the prosaic East, but located their plot partly on Santa Cruz, one of the romantic islands along the California coast, partly in the town of Santa Barbara, on the mainland, under the Spanish régime nearly a century ago. At that time Santa Cruz was—if the librettist tells the truth—the property of Don Francisco de la Guerra, a noble Spaniard of the old style. He had a beautiful daughter named Barbara, who had been educated in the mission school of Santa Barbara. On the day when the plot begins she is expected back on the island by her father, and also by her cousin, an impulsive young Spaniard named Alvarado, who has made up his mind to marry her. Before Barbara arrives we are made acquainted with the other two leading characters in the play, the Indian maiden Natoma, and Paul Merrill, a young naval officer, whose ship has dropped anchor in the bay of Santa Barbara and who has repeatedly rowed the thirty miles to the island to meet Natoma, "the Maid from the Mountains." She has been the playmate and handmaiden of Barbara during their childhood, and now she has fallen madly in love with the officer. She tells him in Hiawathan metres about her ancestors, who came from the clouds, and how at one time the meat of the abalone, tossed up by the ocean, saved the tribe from starvation. But now she alone is left, the last of her race. She tells him also of the beautiful Barbara, who is expected every moment; and foreseeing that she will be forgotten after he has seen Barbara, she begs him to take her, beat her, to let her be his slave, and falls at his feet. Her apprehensions are soon made real. Barbara arrives, the lieutenant is introduced, and it is a case of love at sight for both. The first impulse of the jealous Alvarado is to stab the American, but Castro, a half-breed, persuades him to wait till the next day, when there is to be a grand festival on the mainland in honor of Barbara's return, and then to have ready fast horses for carrying the girl away to the mountains.

In the second act the festival is held, with due regard for local conditions and color. There is, among other things, a dagger dance in which Natoma and Castro take part. Alvarado seizes this moment to throw his *serape* over Barbara and pull her toward the horses; but Natoma rushes forward and plunges her dagger into him. The Spaniards threaten to kill her, but Paul draws his sword and with his sailors holds them at bay. Then Father Peralta holds up his crucifix and allays the fury of the crowd with the words: "Vengeance is mine, sayeth the Lord." In the last act Father Peralta finds the Indian maiden in the mission church, where she has been crooning an Indian lullaby and singing bitterly of the injustice to her people in the encroaching of the whites. In impassioned accents she now calls upon the great Manitou to aid her in destroying them. The father tells her there is only one God; and by appealing to her love of Barbara succeeds in comforting and converting her. The happiness of her friend alone concerns her now. As Barbara and Paul are kneeling in the aisle she passes through the doorway of the convent garden and the doors close upon her. The church music stops, and after a pause the full orchestra plays Natoma's Indian theme of Fate.

In accepting this libretto as the basis of his first grand opera, Mr. Herbert acted wisely, overlooking its many amateurish qualities of construction and versification for the excellent musical opportunities it gives. There was a time when a librettist was expected to do little more than provide pegs for composers to hang their tunes on. To-day, the pendulum has swung to the opposite extreme, as in Puccini's "Girl of the Golden West," in which the music is subservient to the text and of secondary importance. "Natoma" occupies middle ground; some of its lines need music to hide their weakness, while, on the other hand, there is a sufficient number of dramatic moments to keep up the interest in the action; and altogether, the music is of greater importance than the action, just as it is in the operas of Wagner and Verdi.

In one important respect it must be said that Herbert has succeeded where Puccini failed: in providing a genuine American atmosphere for his opera. Puccini is always Italian in his Californian opera, even when he trifles for a moment with an Indian theme or a Foster folksong. Herbert's patriotic songs in "Natoma" are as American as the music of his operettas; the dances of the second act have the true Spanish color, and the Indian themes are really Indian, particularly the Dagger Dance and one of Natoma's songs in the second act. The harmonization is Mr. Herbert's own, as a matter of course, for the Indians have no harmony. Unlike Puccini, who in his last opera almost abandoned the use of leading motives, which had done him such good service in "Tosca" and "Madama Butterfly," Herbert makes effective use of them, not so much in the polyphonic and elaborate Wagnerian way as in the simpler method employed in "Carmen" and "Tosca."

In the music itself there are passages reminding one of MacDowell, Grieg, Dvořák, Puccini, but most of the time we hear the individual voice of Victor Herbert; and what is most surprising is that in only a few places does the music recall the fact that the operetta has been for many years Mr. Herbert's chosen field; nearly the whole of the "Natoma" score is, in the treatment of the solo voices, the chorus, and the orchestra, genuine grand opera. The question whether, besides being genuine grand opera and genuinely American, it is also an operatic masterwork cannot be answered by an unqualified affirmative. But there is as much good music in it as in most of the operas that come to us from abroad, and it certainly deserves a place in the current repertory for years to come. Not only is it by far the best grand opera ever composed in America, but it will doubtless be looked back to, in times to come, as the beginning of a real American school. Among those in the cast Mary Garden, Lillian Grenville, John McCormack, Gustave Huberdeau, Mario Sammarco, and Frank Freisch most distinguished themselves; but the last named, who was trained in England in opera in English, was the only one whose words could always be understood.

On March 4 Henry Holt & Co. will publish "Some Forerunners of Italian Opera," by W. J. Henderson.

After an absence from New York of a year and a half, Luisa Tetrazzini returns to this city, not for opera, however,

but at the head of her own concert company, with which she has been so successfully touring the country since December last, and will be heard in Carnegie Hall on Monday evening, March 6.

It is stated that the number of musical critics who attended the first performance of Strauss's new opera in Dresden was 137. The "Rosenkavalier" will be produced in Paris by the Dresden Opera Company, which will also present, "Elektra" in the same city.

King George has consented, we learn from the *Athenæum*, to deposit on loan at the British Museum the whole of his musical library, which includes the series of Handel autographs presented to George III by John Christopher Smith, amanuensis of the composer; a large volume chiefly in the autograph of Henry Purcell; manuscripts by Agostino Steffani, who was closely associated with Handel. There are also many works by Johann Christian Bach, the eleventh son of Johann Sebastian Bach; a copy of Mozart's early sonatas, Op. 6, dedicated to Queen Charlotte and presented to her in 1765; autograph inscriptions by Mendelssohn; full scores of Wagner and many other composers; an almost complete set of pianoforte scores of Auber's operas. The manuscripts are about 1,000 in number, and the printed music and books about 3,000.

The coming production in Paris of Chabrier's opera, "Gwendoline," and the performance in New York of the same composer's "Briséis" by the MacDowell Chorus on March 3, have awakened interest in the brilliant French musician who died seventeen years ago and to whom this later generation at last is bringing a tribute of recognition. Chabrier was at work on his opera "Briséis" when he died in 1894 aged only fifty-three. Only a single act, the first, was finished, but this fragment has been pronounced a complete work of art in itself. It is a symphonic poem depicting the contrast between Greek paganism, with its joy of life and love of beauty, and the austerity and self-renunciation of the early Christian dogma. The poem by Catulle Mendès is founded on Goethe's ballad, "The Bride of Corinth."

Art

THE ART OF WINSLOW HOMER.

Since for many years I have admired the pictures of Winslow Homer, just this side idolatry, I hate to acknowledge that the first glimpse of the memorial exhibition at the Metropolitan Museum made me wince. It seemed impossible that so many fine works by one hand should be so discordant. Here were so many openings in the wall, but the vistas revealed no principle of harmony. Except for a uniform energy in the work, these pictures might be the product of several men of different ages and training. Here is a man who apparently faced nature with no preferences and preconceptions, and set himself to study almost impersonally her dynamic phases. Plainly, it was the struggle of men with the sea, of the waves with the land, the slow, powerful heave of tropic seas, the poise and buoyancy of boats among threatening billows, the battling of trees with the tempest—in general, a world of ceaseless strife and motion that engaged Winslow Homer's imagination. What is baffling in his art is the absence of formulas. He seems to have had no liking for this or that form of color emphasis, no habits of the hand, no desire to unify or attenuate the rawness of the thing seen. He faces nature with a kind of ruthless impersonality. He repels while he attracts, is distinguished in virtue of a magnificent commonness and a wilfully prosaic probity. He gives a keen and paradoxical sensation that I have encountered nowhere else in art except in the superb and more civilized brusqueness of Edouard Manet. And again in Winslow Homer one frequently sees the great single contour, the direct assertion of color and plane, the general primitive aspect that the neo-impressionists affect without attaining. Had he only consented to be eccentric in color, he might have anticipated the notoriety of Gauguin. As it was, Winslow Homer kept to his studio at Prout's Neck, in view of his beloved sea, and painted with advice of no one, in oblivion of praise or blame.

A kind of primitivism is of the essence of this art. Here is a self-schooled man, free from transatlantic influences, who paints as if Düsseldorf, Barbizon, and Giverny had never been heard of. Christian Brinton, in an interesting essay in *Scribner's Magazine*, has recently celebrated this Americanism of Winslow Homer. And, indeed, in impetuous scorn of conventions and adoration of energy he may be regarded as the most American of men. Yet I feel that the isolated position of Winslow Homer makes him something more or less than American. Obviously, no other nation can claim him; but did we really possess him, or does he by an exceptional and wholly individualistic superiority dominate us? For me he does not fit easily into our American scheme, as Frederick Remington did, but quite disconcertingly evades classification after the fashion of Walt Whitman. And of the two, Whitman was more of our sort, if only for his diffuseness and enormous easygoingness. Nothing of this in Winslow Homer. His mode is concise and tense. Some taciturn trapper or skipper reckoning with natural appearances might paint like this. These pictures have no look of things that are composed or meditated in a studio, but of things that vehemently occur amid the clash of waves and rapids. In this memorial exhibition of some fifty pictures, two or three quite exceptionally have great charm, but without this demonstration I should have supposed it impossible that so many fine works should have of charm just nothing. It may seem a pity to begin our analysis with negations, but this conscious asperity is the central quality of the man, and from it grow both his greatness and his limitations.

Take his last work, the unfinished picture, Shooting the Rapids, Saguenay River. A sweep of inky gray gives the heave of a treacherous shute down which races a birch-bark canoe. Guides at bow and stern strain to keep clear of the rock which reveals itself in a heavy spurt of yellow foam. In the centre a sportsman braces himself with that exhilaration which is just a little qualified by fear. The whole thing is gaunt, powerful, emphatic; the mere indication of the tense distorted faces of the paddlers is caricature of a striking type. It is, let us say it frankly, very ugly, and quite unforgettable. What the artist wanted was clearly the assertion of the heave and rush of the rapids, of the strain of the figures, and for the rest he contented himself with an approximate notation of the local color. And this means that the picture was not conceived in what we call beauty, but in energy that implied nothing more harmonious than nature herself. Had the finished picture attained charm of color or rhythm of line or mass, these qualities would have been secondary and imputed, and it is difficult to imagine that anything charming could or would have been superimposed upon these repellent sooty preparations. Now recall Whistler's truest paradox that the fine picture is finished as soon as begun, reveals, that is, at every stage some principle of harmony and arrangement, and a very serious shortcoming in Winslow Homer's vision and method will be apparent. He is often harsh beyond the needs of his particular form of expression. Observe those masses of white paint—most perishable of pigments—that indicate the uprush of waves shattered on the rocks. That procedure suggests very well the massiveness of the ocean's attack, the formidable hydraulic fact, but how little it suggests the color of such translucent columns or the subtle weaving of festooning curves between sky and sea! In short, while the artist's business, generally speaking, is to make things more orderly than they seem, Winslow Homer, for the sake of anarchic force, has made them less orderly. And here again one recalls Whitman, who, not satisfied with spurning the trammels of verse, created a rhetoric looser than that of prose.

The analogy does less than justice to the magnificent lucidity of Winslow Homer. And I have felt freer to emphasize his sacrifice of the rhythms of form and color to expression of force, because the sacrifice was evidently a conscious one. The harmonies did not escape him; he evaded them. How lovely is the darkling blue and green in the wave depicted in Sunlight on the Coast! How filmy and fairly calligraphic the drift of spray to the left, how pictorial-

ly satisfying the slow roll of the steamer athwart distant billows! The whole thing has a sober, saturated radiance that we shall rarely meet except in the water-colors. Beautiful in tone, again, is the Banks Fishermen, with a dory splendidly poised above a net shimmering with herring. Their metallic lustre dominates the accessory blues and grays of the picture, and a red buoy balanced in green water is a fine note of contrast. Again the coppery flesh colors and leaden hue of the sea in the strange canvas, Sunset and Moonrise: Kissing the Moon, are keenly original and effective. The whole composition—the grim heads that rise abruptly from a dory lost in the trough of the sea, the crest of a wave that licks up to the cold disk of the moon in a sky of slatey violet—all this is most personally invented; much less the cross section of reality than it seems. But it is evident in this and many other pictures that color had no preciousness to him intrinsically. It was a powerful language that told of the motion of things, and rendered facts of farness and nearness, nothing more. Colors to him were instruments, not friends and foes. Of that sense of arbitrary fitness and harmony which is the mark of the great painter he had nothing; and if harmony appears in his pictures, we may fairly suppose that it was not invented, but caught fresh from nature. The thought occurs that one who recked so little of the beauties of color should perhaps have worked in monochrome. And the gaunt silhouettes of Capes Trinity and Eternity are here to suggest what he might have done in this manner. The titanic scale of the subject he has achieved, and with a little more richness and variety in the grays and a pleasanter surface quality, what is a superb study would be a masterpiece. Yet if Winslow Homer had eschewed color, we should be the poorer. His parsimonious palette, based solely upon realistic intention, is, after all, highly symbolical of the coldly destructive seas of the north and of the sturdy folk who cope with ocean for their livelihood. Moreover, it is instructive to see what truth and vigor of color construction can exist apart from tone. That is almost a new chapter in the technique of painting, and it paradoxically links the primitive artist Winslow Homer with such musical anarchists as Richard Strauss and Dubussy who have discovered that musical construction need not imply either melody or harmony.

The last twenty years of Winslow Homer's life were spent in relative seclusion at Prout's Neck, Maine. With occasional flights to the deep woods or the West Indies and Florida, he settled down to two subjects: the sea gnawing at the land, and sea-folk struggling with the sea. The actual clash and fury that shapes the edges of the continent he painted with a force and energy attained by no other artist. It is unnecessary to specify pictures of this type. There are not many of them, for he was a slow worker, but they constitute possibly the most generic achievement that American art has to show for itself. Yet the masterpieces are possibly elsewhere. The best of Winslow Homer's fishermen are seen with a simplicity and largeness that is instinct with style. The most famous picture of this sort is, of course, the gaunt moonlit face of the lookout who rings eight bells. Of equal quality is the picture of the same title, with two figures, which Mr. Stotesbury lends to the memorial exhibition. Here we have the great contours and generalized modelling of Millet, and a true sense of the physical littleness and spiritual might of those hardy men who go down to the sea in ships. Such pictures are more concentrated and less subject to defects of color than the more famous marines. There is in them a hint of manly admiration, the impersonal creator is caught off his guard, and a severe beauty gets into the work.

No estimate of Winslow Homer can be a fair one which fails to take into account the fact that he began as and in essentials remained an illustrator. The civil war liberated him from hack work in a lithographer's shop. Besides war sketches for the wood block which brought him fame, Winslow Homer found time to paint *genre* pictures of army and negro life. He displayed the knack of the journalist draughtsman and something more. A single study, showing negro soldiers lolling on the sunny side of their tent, is in the present exhibition. It has character, and the sky is beautifully painted. The National Academy of Design showed an uncommonly keen sense of merit when it elected him an associate in 1864 and the year after promoted him to full membership. In 1867, being thirty years old, he made the prescribed visit to Paris, whence, unlike thousands of his colleagues, he returned unscathed. For a matter of ten years he roved widely in the forests of Maine and Canada, in the still wild Adirondacks, in Florida and Bermuda, producing more sketches than pictures, and still continuing the *genre* vein that was proper to him as an illustrator. Some of his best work of this sort, fish leaping at the fly, tenting scenes, etc., transcends the stock illustration for the sporting press only by its energy. A picture like Snapping the Whip, with its line of romping schoolboys, shows how undistinguished his vision was as late as 1876. Close inspection of it will show a fine and masculine workmanship. The hand is ready, but the mind still hesitates and does its seeing casually or at second hand. It was not till his fifties that we begin to get pictures of the quality of Banks Fishermen, 1885, Undertow, and Eight Bells, 1886, and it was still a decade before the conviction began to spread that we had a great painter among us. It was a sojourn in Gloucester in 1878 that initiated him into the life of seagoing fishermen, and his finest pictures are more or less reminiscent of this period.

An interesting and not quite explicable episode in his development is his work done at Newcastle, England, between 1881 and 1883. It has an amenity nowhere else appearing in his art. It seems as if England mollified the wanderer. There are even odd suggestions that the sentimentalism of current British painting may have reacted ever so little upon his stern manner. The English sketches have a peculiar flavor. How account for that admirable monochrome, of a lugger, lent by Mr. Drake, in which sit peasant girls with the classic poise of goddesses? Ingres would not have set them down with a subtler line, and Frederick Walker would not have conceived the subject very differently.

Within a few years Winslow Homer was in his retreat in Maine, and his work had already assumed that harshness which was to be his characteristic to the end. What caused this swift and radical reaction from the sweet new style acquired in England is a critical problem of some difficulty. We have no right to pry into the causes of that carefully guarded seclusion at Prout's Neck. Indeed, there is a sufficient obvious cause in the man's hatred of crowds and love of the sea. As for the change of style, it may rest upon the strange objectivity of the man. Where there was atmosphere and picturesqueness he painted it, where it was lacking he scorned to prettify the crude reality. The case may be as simple as that. And yet I fancy the intimates of Winslow Homer could, if they would, give us a more psychological explanation. In any case, I would not press the point of objectivity, for Winslow Homer was much more the conscious personal artist than he seems, his devices being merely unusual and well concealed.

On several occasions, notably at the Pan-American Exhibition at Buffalo, Winslow Homer chose to be represented by his water-colors. Doubtless he felt in them possibilities of harmony lacking in his larger works. In these water-colors, many of which were made in sub-tropical seas, rules absolute simplicity of statement. They are exhilarating from their calculated audacity. A few sweeps of the brush, an added accent or two, and a blue expanse of quiet sea spreads out before you, or the lush tangle of Everglades, or the lustrous shambling forms of half-nude negroes luxuriating in sea and sunshine. Of the series devoted to American fishing and camping scenes Mr. Huncker has somewhere said with a certain inuendo that they will be liked by those who like

the subjects. The observation illustrates once more the artist's proud habit of abstracting himself from his work. Yet the water-colors show an easier and more likable accomplishment. They never attain the finer and more mysterious harmonies, but they are sonorous in a fashion foreign to the oil paintings. Most of the water-colors betray a very definite illustrative intention. A capital instance is the study for Hunter and Hound. The hunter in a canoe has caught a buck by the horn; the swimming animal drags the boat down stream while a hound paddles desperately in pursuit. The determination of the hunter, the slip of the boat over the water, are admirably expressed. Strident whorls of white indicate the great ripples that enfold the struggling beast. It is a remarkable vision of energy unqualified by any desire for arrangement. And here it is instructive to note the considerable changes made in the oil painting. The crudity of the delineation has yielded to a certain mystery. To the left the river turns in and affords a vista. In short, though the compositional changes are slight and in a manner obvious, they show the artist seeking a greater unity through complexity, working, that is, in the spirit in which good pictures have always been made.

It would be interesting to review the water-colors in the memorial exhibition, but it is better to take collectively those brilliant studies which catch the radiance and slow potency of tropic seas, the swing of moored boats in the shallows, and the battling of sailing craft with the gale. There is an extraordinary sketch of palms searched and shaken by the hurricane. For technical mastery nothing equals the sketch Homosassa, Florida, in which two simple washes do duty for the sunlit front of jungles in foreground and middle distance, while a single murky wash of purple slightly accented suggests the whole complication and mystery of the inner forest. I suppose a painter would unhesitatingly stake the greatness of Winslow Homer on a few of these consummate sketches, and they are indeed among the unprecedented things. They recall vaguely certain triumphs of the Japanese in similar themes, but the American work is swifter, more potent, less schematic. I cannot imagine that work so individual and invigorating will quite be forgotten.

To anticipate the verdict of the future on Winslow Homer would be presumption, yet this much may safely be said: that he bulks large to-day partly because of the debilitated estate of American painting during his lifetime. Whenever painting has resumed a normal force and expressiveness, his peculiar merit of energy will inevitably seem less rare, while in better times than ours his defects in arrangement and tone may well be judged more harshly. Meanwhile his memory deserves the most generous admiration from his contemporaries. If he narrowed himself and sacrificed merits that seemed cheap to him, it was for the sake of truth and intensity. He seems to have had little music in his soul, but he had a blunt and forceful way of saying what he meant. Unquestionably, he has deepened the common vision of our sea and forest and their folk. In short, he did about all that a potent individuality, isolated, unsustained by a sound tradition, can do in our day. A more fortunate age that has arrived at vital formulas may perhaps find his work a shade anarchical, brusque, and incomplete, but such criticism, I believe, will be tempered by profound admiration for a great spirit. The stark apparition of Winslow Homer may remind some future critic that in the off days of art in America we lacked not so much great personalities as a social tradition to give them support and an æsthetically enlightened remnant to afford them companionship.

FRANK JEWETT MATHER, JR.

A monograph on the life and works of Thomas de Keyser, the Dutch painter of the seventeenth century, is in preparation by Dr. Oldenberg, director of the Old Pinakothek at Munich.

In fitting out the remains of the Baths of Diocletian for the Archæological Exhibition in Rome for the current year, an interesting and unexpected discovery was made of two hitherto unknown swimming-baths, lined with marble, into which broken granite columns and a large quantity of decorated marbles, stone, and porphyry had fallen.

Further discoveries have been announced on the site of Meroë, the ancient capital of Ethiopia. A hoard of gold, including pectorals inscribed with the names of the Ethiopian kings, was found inside two Egyptian terra-cotta vases under the floor of the royal palace, which has now been completely excavated. Another large building of later date, with a central court and numerous halls and chambers, has been outlined. There have also been unearthed a dais and royal throne, and steps adorned with representations of hound captives.

We have received the prospectus of the Société Française de Reproduction de Manuscrits à Peintures, the purpose of which is the integral reproduction of the most precious illuminated manuscripts of France and other countries. The president of the executive committee is Baron Eugène Fould-Springer, 54 Avenue de Jéna, Paris, the vice-presidents are Emile Picot and Henri Omont; the secretary, Count Alexandre de la Borde, treasurer Jacques Doucet. Jules Guiffrey, Count Paul Durrieu, and Henri Martin constitute the committee on publications. The society is to have international scope and admits members of either sex. The titular membership, which includes a copy of the annual publications, is set at one hundred francs annually, the associate membership at twenty-five francs. On payment of an additional seventy-five francs associate members may obtain the publications for any year desired. The first publication, in four volumes, will be the superb "Bible moralisée," French workmanship of the thirteenth century, the severed parts of which are in the Bibliothèque Nationale, the Bodleian, and the British Museum. Eventually the society hopes to create a corpus of the finest illuminated manuscripts. Application for membership should be made to the president.

Fritz K. H. von Uhde, the German painter, chiefly celebrated for his religious scenes, died at Munich last Saturday, in his sixty-third year.

We have to announce the death of two French artists: Anatole Guillot, the sculptor, aged forty-five, was a member of the Société des Artistes Français, and is best known for his statue to Vauban and his sculptures on the tomb of Coquelin at Pont-aux-Dames. Urbain Bourgeois, who died at the age of sixty-eight, was a prominent painter.

Finance

THE RAILWAY RATE DECISION.

The first response of the financial markets to last Thursday's Interstate Commerce Commission decision, refusing to grant the 10 to 20 per cent. advance in rates for which the railways had jointly applied, was a break of 2 to 5 points in stocks. Recovery followed, however; then mere inactivity, and inquiry as to what had really happened. The first comment on the decision was an entirely pessimistic forecast, by various railway presidents, of its effect on general business. Within a day or two, however, opposite views began to be heard. Important railway men pointed out, with Mr. Yoakum, that the situation was in reality just what it had been before; with Stuyvesant Fish, that the decision made for stability in putting an end to agitation both by shippers and by labor; with James J. Hill, that a general rise in rates would merely have started a vicious circle of rising operating expenditure, and with Howard Elliott, that good crops in 1911 were a far more important consideration than higher rates.

The general public, after its first shock of surprise, began to study the text of the commissioners' opinion, and its judgment was considerably influenced thereby. The argument for the railways, as submitted to the Commission by their counsel, has been based on various grounds—on the allegations that increase in wages has increased operating expenses; that cost of materials and supplies has risen; that enormous expenditure has been made for the public convenience in such enterprises as elaborate terminals which were non-productive. Net earnings, it was contended, were consequently decreasing, or were bound to decrease, to a level where satisfactory dividends

could not be paid; accumulation of a proper surplus by the railways was or would be prevented, and the loan market, for these and other reasons, was becoming increasingly difficult as a recourse for raising additional capital.

The Commission's main opinion, prepared by Commissioner Prouty, examines with great thoroughness all of these contentions. In regard to wage increases, it finds from the record that even had last year's higher wage scales prevailed during the whole of 1910, aggregate net earnings of the railways would still have exceeded 1909 by $16,000,000, and that the actual net receipts of 1910, estimated on any basis, were greater than ever before in the country's history. As to railway materials and supplies, the price of such commodities was in 1910 below the average of the past five years, and the Commission believes that general cost to the railways, both of material and labor, "will not be greater in the immediate future than it has been in the immediate past." The plea based on non-reproductive expenditure the Commission admits, within certain limits, but contends that stockholders should share with shippers in the burden of providing the requisite capital.

On the question of maintaining satisfactory dividends, considered in itself, it is pointed out that the amount thus paid in 1910 was greater than ever before in history, that the proportion of outstanding railway stock which now pays dividends has been exceeded in only one previous year (1907), and that the average rate paid in 1910 was more than 2 per cent. above 1901, and, again excepting 1907, had never before been equalled. Finally, the opinion flatly disputes the assertion that railway credit is impaired; the fact that securities can be placed on less advantageous terms than a decade ago being ascribed altogether to the general rise in price of capital, which has affected governmental equally with corporate borrowers.

It has been apparent to every one in touch with the controversy, both before and since the Commission's decision was rendered, that the really perplexing consideration had to do with the railways which were not prosperous; railways which—whether because of unfavorable location, or inefficient management, or too heavy a burden of fixed charges as the result of over-capitalization—were not earning good dividends and therefore could not be classed in the Commission's instances of railway prosperity. These companies at all events, it was alleged, had a right to ask for higher rates.

To test this argument, let it be imagined that the commissioners, after specifying these particular companies, had granted to them the right to impose higher rates and had denied it to their prosperous competitors. Every railway man knows that such a decision would not have solved the difficulty at all. For the weak roads to have put into effect their exclusive privilege of higher rates, would have been to sacrifice their business. Precisely the opposite policy was pursued by the old-time Trunk Line pool in its system of "differentials," whereby a railway with a round-about route or inferior facilities was allowed, in a certain fixed percentage, to underbid the stronger lines in its charges for transportation. That was at least the path of logic. The weaker lines could no more use to-day than they could in 1886 an exclusive privilege of establishing higher rates.

It will perhaps be rejoined that, in adjusting rates for all the railways, the needs of those least advantageously situated must be made the basis. But a little reflection shows to what this principle would lead. Recognizing the fact of a virtual monopoly in transportation, and of a scheme of rates which admits of no competition save in quality of service, the Government is asked to grant such rates as would insure a satisfactory dividend to all the companies in the business. If one railway had been mistakenly located, plundered in the provision of capital and equipment, or neglected and mismanaged in operation, its rates must none the less be raised to a level which would admit of satisfactory return on its outstanding capital. Not only so; but other railways for which existing rates were entirely adequate—whose dividends, averaged one with another, were already high—must also be permitted to charge the higher rates, in order not to prejudice the unlucky lines. In principle at any rate, such a concession would be nothing more or less than guaranteeing a profit to every American railway undertaking, under any and all circumstances, and guaranteeing it through imposing an extra charge on all the patrons of every railway.

There is, finally, the argument that if the railways get larger revenue, they can make larger disbursements in the trades whence they buy materials and supplies. No one disputes that conclusion. But if a 10 per cent. advance in rates will help in such directions, then a 20 or 30 per cent. advance would be even more beneficent, and might serve to create double the present activity among the mills. This, it is true, does not meet the supposable case that railway revenues might have become so low as not to admit of any such purchases whatever, save for bare and immediate necessities. But the Commission failed to find, in the testimony submitted, any evidence of such a position of affairs, present or impending.

These are the aspects of a rather remarkable episode in railway and investment finance. Its longer influence on the general situation is still more or less a matter of conjecture. But this much may be said—that if the decision shall have the effect of inspiring the railways with the determination to increase their earning capacity still further through the application of yet more thorough system and economy, it is possible that at some future time even the recent railway applicants for higher rates will admit their reverse to have been a blessing in disguise. That is, however, a matter for the future. The interesting thing at present is the Commission's testimony, while denying the railways' request, to the real and genuine prosperity of the industry.

D. APPLETON & COMPANY

29-35 West 32d Street, New York City

DIAZ: MASTER OF MEXICO

By JAMES CREELMAN

Illustrated from Portraits, Photographs, Paintings, etc. 8vo, cloth, $2.00 net.

This timely volume is more than a biography of the remarkable Mexican President. Besides relating the chief events in the life of Diaz, the book describes the evolution of the Mexico of 1848 into the Mexico of to-day. This is done chiefly through narrating the rise of Diaz from obscurity to prominence, the part which he took in the creation of the modern régime out of the old, and the chief events of his long reign as President of the Mexican Republic, and in particular by a full setting forth of the situation as it exists at the present day in the Mexican Republic. Mr. Creelman had unusual opportunities for gathering material and his book contains a large amount of new and illuminating data.

EGYPT: ANCIENT SITES AND MODERN SCENES

By G. MASPERO

Profusely illustrated. 8vo, cloth, gilt top, $4.00 special net.

"A delightful book about Egypt which every traveler on the Nile should read. The author takes his readers up the river from the delta to Assuan. He tells what he sees on the way; sometimes only the modern scene, sometimes a story of antiquarian research, but always entertaining. The book shows the Nile Valley to those who visit it and to those who cannot go there in person in most attractive form."—*New York Sun.*

FAMILIAR TREES AND THEIR LEAVES

By F. SCHUYLER MATHEWS

Newly revised and enlarged. 12 pictures in color and about 220 Drawings from Nature by the Author. Large 12mo. Cloth, $1.75 net.

This manual has been brought up to date by a thorough and systematic revision. A supplement has been added containing information about many trees which were not discussed in the earlier editions. The result is that the book, which long has been standard, is now quite the most modern and reliable handbook in its field.

THE PRINCIPLES OF INDUSTRIAL MANAGEMENT

By JOHN CHRISTIE DUNCAN, Ph.D.

12mo, cloth, $2.00 net.

The object of this book is to present a scientific treatise on the business management of corporations. It furnishes more than the mere methods of making entries in books. It covers such points as Locations for Plants, Business Specialization, Plant Layouts, Fire Precaution, Power Problems, Plant Management, Keeping Records, The Labor Force, etc., etc.

RAILROAD TRAFFIC AND RATES

By EMORY R. JOHNSON and GROVER G. HUEBNER

Elaborately illustrated with Maps, Charts, Diagrams, and Forms. 8vo, cloth, 2 volumes, $5.00 net.

These volumes have been written primarily to meet the demand for authentic information regarding the intricate and detailed work connected with railroad traffic and rate making. The book is the result of years of study. Each chapter has been read and criticised by practical railroad men who are experts on the subjects covered. The book will be useful to railroad men, financiers, government officers, large shippers, university students, and all those interested in transportation questions.

THE PREVENTION OF INFECTIOUS DISEASES

By ALVAH H. DOTY, M.D.

With complete index. 12mo, cloth, $2.50 net.

The splendid work which Dr. Doty, as Health Officer of the Port of New York, has been doing for years in saving New York from the spread of infectious diseases gives his book special importance. He deals with the subject from the practical standpoint, and presents the latest knowledge relative to the transmission of infectious diseases and the means by which they may be prevented.

THE AMERICAN YEAR BOOK FOR 1910

A Record of Events and Progress

887 Pages. Completely indexed. Small 8vo, red cloth, $3.50 net.

The American Year Book records the happenings during the year in every department of human activity, with especial stress on American affairs. It is not to be confused with the ordinary newspaper almanacs. It covers progress in the fields of science, history, literature, art, sociology, politics, commerce, etc., and has in addition concise national and international statistics; a chronology of notable events; a select bibliography; and a variety of tabular matter. It has been the aim of the editors to reach the highest point of authority and accuracy. All the departments have been handled by experts. The work is arranged with the idea of serving the busy man who wishes his information to be compact and absolutely reliable.

Just Published

ELEMENTS OF DESCRIPTIVE GEOMETRY

By **Albert E. Church**, LL.D., late Professor of Mathematics, United States Military Academy, and George M. Bartlett, M.A., Instructor in Descriptive Geometry and Mechanism, University of Michigan.

$2.25

A modern and up-to-date revision of this standard book. Figures and text are included in the same volume; many exercises for practice have been introduced, and problems relating to single curved surfaces are taken up before warped surfaces and surfaces of revolution. The solution of problems in the third angle, and the profile plane of projection, receive adequate treatment.

SECOND EDITION

John Brown: A Biography Fifty Years After

By OSWALD GARRISON VILLARD

SOME TRIBUTES TO THIS REMARKABLE HISTORICAL WORK.

Philadelphia PUBLIC LEDGER. "A tremendous book; more thrilling than any book of fiction, powerful in its appeal, and which, while it is written soberly, as befits history, by the very nature of the narrative often rises to the highest dramatic level."

THOMAS WENTWORTH HIGGINSON. "I can only say after reading from first to last its more than 700 pages that I have never encountered anything this side of Gibbon's 'Rome' which has made me feel more the personal power of a single work."

JOHN T. MORSE, Editor American Statesmen Series in ATLANTIC MONTHLY. "Perhaps in thus dramatically fashioning his volume, Mr. Villard obeyed an instinct rather than acted upon a preconceived plan; that is often the case with a great work, where a writer's feelings are deeply enlisted. Be this as it may, the merit and charm are none the less; he has seized well a splendid opportunity and has written one of the great biographies of our literature."

HORACE WHITE. "In my judgment a contribution to American literature to take rank with the very best historical writing of our time or any time. The only impartial history of the Kansas war."

ST. CLAIR McKELWAY in the Brooklyn EAGLE. "A biography replete with facts and marked by courage and candor, learning, and justice."

Portland OREGONIAN. "The most valuable and comprehensive biography issued this season, and the best and most candid estimate of John Brown."

W. E. CONNELLEY in the Topeka CAPITAL. "The unprejudiced student and seeker for truth will herald the book as a great contribution to American history."

Des Moines CAPITAL. "More powerful in its appeal, more dramatic than any book of fiction, is this wonderful biography of John Brown."

The North Carolina REVIEW. "In this biography Mr. Villard has touched high-water mark. The book is a delight to the reader for many reasons. Full of life and movement, . . . written in an attractive and scholarly style, full of sympathy and yet without any loss in accurate presentation, it sets a new standard for biographical efforts."

Baltimore AMERICAN. "While the book has popular features in that it is entrancingly interesting, its scholarship is of the highest order and its style reminds one a little of Anthony Froude. . . . Mr. Villard has illustrated in this book the finest ideals of literary conception and execution."

London TIMES. "It is scarcely likely that any later writer will be able either to add anything of importance to Mr. Villard's collection of material or to better his interpretation of the whole story. . . . It at once becomes the standard, and probably the final authority on its theme."

Washington (D. C.) STAR. "Mr. Villard draws a compact, vivid, historic picture of the terrible focussing of this period upon our Civil War. Straight and clear in its literary way, this biography is a marvel of research and fair-mindedness."

HENRY WATTERSON in Louisville COURIER-JOURNAL. "No fault may justly be found with Mr. Villard's telling of the story. It is minute and lucid, altogether fair and unvarnished."

Burlington (Iowa) HAWKEYE. "It is a book which will take a place in the library of every well established home in this part of the country."

FIRST EDITION EXHAUSTED IN 7 WEEKS.

Fully illustrated with portraits and other illustrations. With copious notes and bibliography.

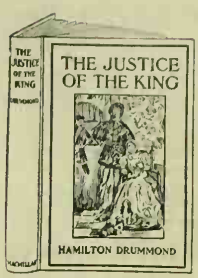
THE NEW MACMILLAN NOVELS

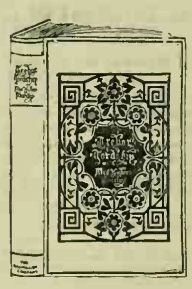
The Justice of the King
By HAMILTON DRUMMOND



There are exciting adventures in this novel, a refreshing absence of blurring historical detail, and an attractive simplicity, full of the charm of tender love-making and the intense loyalty of youth.

Cloth, $1.20 *net; by mail* $1.32.

Trevor Lordship
By Mrs. HUBERT BARCLAY



A pleasant novel of an uncommon kind; its love problem arises between two married folk; each fears that the other's love sleeps, and each dreads to move lest it—fail to awake. The social setting of the story is particularly enjoyable. *Cloth,* $1.20 *net; by mail* $1.32.

While Caroline was Growing
By JOSEPHINE DASKAM BACON

"Caroline" needs no introduction to readers of "The Biography of a Boy," etc., and every one who has ever come into contact with the mentality of a growing girl will find in the story a deal of sympathetic entertainment. *Cloth,* $1.50.

Klaus Hinrich Baas
By GUSTAV FRENSSEN

THE STORY OF A SELF-MADE MAN. A thoroughly remarkable novel is this story of the rise of a physically strong, proud German peasant. There is a similarity between some of the conditions described and those existing in this country which gives the book a peculiar interest to Americans. In many ways it is the most powerfully interesting novel of the spring season. *Cloth,* $1.50.

Adventure
By JACK LONDON

From the opening chapter it is a wonderful feat of imaginative writing. The life described is that of the South Sea Islands in the heat of the tropics and the tension of the white man's mastery. The whole effect is eerie, such as one feels who stands alone by a blazing fire that throws flickering shadows on the blackness of an unfriendly forest. It is strong and fascinating. *Cloth,* $1.50.

Published by THE MACMILLAN COMPANY 64-66 Fifth Ave. N. Y.

The Nation

NEW YORK, THURSDAY, MARCH 9, 1911.

The Week

President Taft has chosen an extraordinary time and place to assemble one-quarter of the army for "manœuvres." In the semi-official explanation published Tuesday the step is said to be due to a desire to meet the charge that the army is not ready for active service—and then the troops are ordered to the Mexican boundary along which the Mexican Government is endeavoring to suppress a revolution that grows rather more than less serious as time passes. We should all understand what it meant if Russia were to assemble troops for "manœuvre" purposes on the Turkish boundary during a serious Turkish revolution. The suddenness of Mr. Taft's move will, moreover, inevitably make people believe that the alleged excuse is a transparent sham and that possession of important information as to actual conditions in Mexico is the real reason for the action. Why this remarkable step should have been taken so spectacularly—even the fleet being drawn in—would also seem to deserve an explanation. The regiments could have been ordered out one at a time; the ships could have reached Texas harbors by leisurely stages via Guantanamo. But the celerity of the whole movement, which includes the hasty assembling and dispatching of a regiment of marines, will disquiet the country. Of course, if it is merely a combination of a practice movement and a reinforcement of the boundary guards to prevent more arms and men being sent into Mexico from the United States, that is one thing. If only this is meant, Mr. Taft would have done well to have stated so officially at once.

Secretary Ballinger's resignation removes a load from the Taft Administration. The President himself early came to the conclusion that Mr. Ballinger was the victim of persecution, and it is to this feeling that we are constrained to ascribe Mr. Taft's persistence in adhering to a man whose unfitness for the Secretaryship of the Interior has been amply demonstrated. But the news of Mr. Ballinger's resignation is not more important than that of the choice made for his successor. Mr. Walter L. Fisher of Chicago, whom Mr. Taft names as the new Secretary, is a lawyer of the highest standing, and a man whose patriotic interest in public affairs has been manifested in a variety of ways. The country can now take it for granted that the management of the nation's possessions in charge of the Interior Department will be vigorously conducted. To this end, it is necessary to have at the head of that Department a man who is not merely free from any suspicion of positive scandal, but who is sure to be aggressively vigilant in the protection of the public interests. Stripped of doubtful matter, the case against Ballinger consisted in denial of his fidelity to this standard; and in the judgment of most impartial critics that case was made out.

If we search the scroll of American history for instances where party spirit stooped to pay homage to preëminent virtue, we hit upon the election of George Washington to the Presidency and the election of William E. Lorimer to the United States Senate. On Sunday the Illinois statesman returned to Chicago like an army with banners. Fifty thousand spectators, without distinction of political creed, cheered him from the sidewalks, and three hundred automobiles, without distinction of make, fell in behind his triumphal car. Let not the cynic philosopher be hurried into saying that if the vote in the Senate had been 46 to 40 against Lorimer instead of for him, Sunday's procession would not have taken place. Senator Lorimer was modest when he declared, in his speech of defence, that he was proud of having wiped out the distinction between Democrat and Republican among his constituents. He might have gone on to claim the much higher honor of having wiped out among a good many people in Illinois the sense of all distinction between right and wrong.

Senator Bailey's exhibition of childishness by resigning in a huff on Saturday and then withdrawing his resignation, will still further alienate from him the public regard. With his great legal abilities and oratorical talents Mr. Bailey once bade fair to stand very high in popular esteem and the national councils. But merely because his party associates do not go so far as he does in his antipathy to the initiative, referendum, and recall, which he describes as "socialistic measures," he is willing to quit public office, and the noble Governor of Texas says that he, too, will take his dolls and play no longer if such radical innovations in political procedure should confront him. How statesmanlike, how courageous! No dying in the last ditch for Senator Bailey! Or is it that Mr. Bailey has turned Christian Scientist and would give these political fallacies absent treatment from outside the political arena? We can only say that if a referendum were taken to-day of all those citizens who wish that Mr. Bailey had not withdrawn his resignation, there would be a vote which would intensify his dislike of the recall.

Chicago now has the best chance she has had in years to elect a Mayor who will be something more than a politician. The impressive victory of Charles E. Merriam for the Republican nomination over four competitors by a plurality of 25,000 is doubtless due in part to the failure of the party bosses to agree on a candidate against him, but this is only a favorable augury for him in the April election. As one of the few instances of the college professor in politics, and municipal politics at that, Alderman Merriam has won a national reputation by his insistence upon honesty and efficiency in the conduct of the public business. His election would enable him to give effect to the recommendations of the investigating commission which unearthed bad conditions a few years ago, and of which he was the head. On the Democratic side, there was no such candidate, and the result of the primary is merely the triumph of the strongest faction. Carter H. Harrison, the four-time Mayor, has obtained a narrow victory in a triangular contest in which his leading opponent owed much of his strength to his endorsement by Roger Sullivan. Harrison himself seems to have made an alliance with the most disreputable elements of the

city, although he must have received many votes because of his cheaper-gas and anti-corporation "issues." The joyful celebration of his victory by the followers of "Hinky Dink" Kenna and "Bathhouse" John Coughlin is the sinister indication of the stick with which he is tarred. His last election as Mayor was by the small margin of 7,000 votes.

The cost of the direct primary in Chicago does not appall its champions in Baltimore, in which city the direct primary has been an integral part of the reform that has raised political conditions above those which prevailed in the old Gorman-Rasin days. As the Baltimore *Sun* very sensibly points out, that part of the Chicago expenditure which consisted in enormous outlays by the candidates should be made impossible by law, while as for the part that falls upon the city, which was about the same per head of the population in Chicago as it is in Baltimore, "the results attained are cheap at the price. A good Mayor is a splendid economy, and is cheap at almost any price." The Baltimore Democratic boss is going to try to unhorse the present Mayor, Mr. Mahool, in the municipal primary election to be held a month hence, and the contest promises to be one of the most interesting that have taken place in that city. There can be no question that the interest in municipal politics on the part of the best citizenship of Baltimore has heightened since the introduction of the direct primary system.

City government by commission has received the endorsement of the Buffalo Chamber of Commerce. By a vote of 318 to 31 the "campaign of education" that has been carried on reached its climax, the plan having previously been endorsed by twenty-two of the leading commercial associations. The effect of the vote is to commit the Chamber to using its influence for the passage of the commission-charter bill, providing for a special election upon the question of the adoption of the new system. The bill lodges the power of passing ordinances and administering the city's affairs in a Council composed of the Mayor and four Councilmen. Candidates for these positions are to be presented for nomination by petition, signed by not less than three hundred electors. The two candidates receiving the highest number of votes for Mayor and the eight candidates receiving the highest number for Councilmen, in the official primary, become the nominees to be voted upon finally. The distinction of the Mayor, who is without a veto, is his headship of the Department of Public Safety, which includes the police, fire, and health departments. All city officers and employees are appointed by the Council, subject to civil-service regulations; initiative, referendum, and recall are provided for; and the granting of franchises is expressly reserved to the citizens, the expense of a special election being borne by applicants for the franchise.

That Ruef has actually at last entered upon his fourteen years' term in prison is news of not less than national importance. No single scandal in recent years has been so disgraceful as that attaching to the infamous conditions in California of which the San Francisco boss was the centre; and perhaps the most depressing part even of that depressing history has been the way in which some of the California courts have permitted themselves to be made instruments for the defeat of justice. A short time ago the Supreme Court of California granted Ruef a rehearing on some technicality; and now they have managed to find another technicality that has permitted them to reverse their former decision and let the law take its course without further foolishness. When the whole political system of a State becomes so permeated with rottenness as has been the case in California it is absurd to suppose that courts can be wholly unaffected; and we suspect that the new virtue of the Supreme Court has come not from any well-spring of legal learning, nor yet from any fortunate accident in the way of the presence or absence of a judge, but from the toning up of the atmosphere that came with the election of Gov. Johnson. California seems at last to be entering upon a better era, and the heroic work of Older, Heney, and the others who fought the powers of darkness and seemed for a time to have lost, has not been in vain.

However triumphant the United Mine Workers may feel over their success in forcing their ablest representative to surrender his opportunities as a member of the National Civic Federation, outsiders will regard the victory as dearly bought. Mr. John Mitchell evidently made the difficult choice with regret, and there need be no questioning of his motives; but it does not speak well for the miners that they should have applied the "closed shop" to one of the most hopeful movements for the conservation of industrial peace. The natural interpretation of their action in making membership with them contingent upon non-membership in the Federation is that they wish to be understood as depending upon their fighting ability rather than upon any form of mediation. This is to throw away, or to hand over to the employing corporations, one of their most effective weapons. The public sympathy which has meant much for the miners hitherto has been won in no slight degree by the spectacle of employees professing their willingness to submit their case to impartial judges, with their employers evincing a stubborn reluctance to adopt the same course.

Upon the tragic aspects of the death of Mr. John Carrère it is unnecessary to dwell. They carry their own pang. It seems beyond question that recklessness amounting to criminality, on the part of his chauffeur, was the cause of the accident which killed him. When such a life is blotted out in the purely avoidable perils of our city streets, it certainly reinforces with the utmost solemnity the argument for regulating the operation of street-cars and automobiles in the most stringent fashion. Of Mr. Carrère's high professional attainment we need say nothing here. He has left enduring monuments to it. And his personal charm and worth will live long in the memory of his friends. It is pleasant to note also, in the tributes to him, the warm appreciation of his public spirit. He was not only an architect; he was a citizen, and the beautifying and bettering of the city really meant more to him than his successes in his profession.

A fitting feature of the campaign for increased endowment of Johns Hopkins University is the movement among former students of the Greek department to provide a Gildersleeve Classical Library fund. There are scores of men

all over the land who would not hesitate to say that the privilege of knowing Professor Gildersleeve in his chosen field, and the power to appreciate his genial Hellenic culture, would constitute ample justification for all the hours given to the study of Greek. Certain temporary freaks in philological studies have led many into the apparent belief that the natural effect of devotion to "the humanities" is to dehumanize, but Professor Gildersleeve has shown it possible to put human feeling into so seemingly forbidding a receptacle as a Latin grammar; while every reader of the *American Journal of Philology* knows that the learning which flows into his editorial department under the heading of "Brief Mention" sparkles with some of the most charming wit and humor to be found in the entire realm of periodical literature.

The protest raised by certain Irish members of the Worcester High School board of trustees against an historical text-book which makes St. Patrick a native of England, reminds us that the time is ripe for the organization of an institution of Tailor-Made History, where any person or any community may have its text-books written in accordance with definite specifications. This is not so striking an innovation as may appear at first sight. Let it be recalled that there are really very few unquestioned facts in history, and these undoubtedly stand unchallenged because people have grown tired of questioning them. From the very beginnings of the art, history has been written to support a national, racial, or party thesis. Not infrequently it has been written to please a single individual. If the modern school-boy finds the catalogue of ships in the Iliad a trifle monotonous, the explanation is that Homer felt in honor bound to assign a place in the Trojan war to the ancestor of every Greek squire who supplied the itinerant bard with a good meal and a bed for the night. If there are enough people in the South who wish it put on record that Vicksburg was a Southern victory and that Mr. Lincoln was a secret adherent of the Mohammedan faith, why not do it? And so with St. Patrick. Why not have him born in Ireland in the interests of good feeling? For that matter, why not have him born at Worcester?

The verdict in the case of the friar lands in the Philippines rendered recently by the Republican majority and minority of the House Committee on Insular Affairs, "vindicates" the Government, but plainly conveys the warning, "Don't do it again." A third report, that of the Democratic minority, is yet to be heard, and it may be as convincing to the country as was the minority report in the Lorimer case. So far as the majority is concerned, it upholds the Government's contention that the organic law which prescribes that no citizen can buy above forty acres and no corporation can buy above 2,500 acres did not apply to the friar lands subsequently purchased by Mr. Taft. Perhaps it did not; perhaps there was a legal technicality permitting the sale of larger parcels, but the proper attitude for the Government, we still maintain, would have been to follow the spirit of the organic law and not to violate it because it had some lands it could dispose of in large amounts. It is simply a matter of checkmating special privilege in the Philippines. On his last visit to New York, Governor-General Forbes made it his business to encourage large financial interests to take hold of things in the Philippines—at the very time when the people of this country are endeavoring to shake certain interests out of their too close relations to politics and government. It is merely a question whether the Philippines are to be held for the Filipinos or to be exploited for the benefit of our Trusts. As the minority recommends, Congress should promptly apply the organic law to what remains of the friar lands.

The English Unionists have fallen into an extraordinary state of confusion. The erstwhile dominant party might almost be described to-day as a party without leadership, without principles, and without a programme. The condition cannot be described as one of panic, because panic means a very real state of fear of some very definite object. But the Unionists as a body are not even seriously afraid of anything in particular. Home Rule has failed to galvanize the old passions into new life. Some wild newspaper threats there have been of Ulster insurrections, but no one seems to have taken them seriously except the reporter who prophesied them, presumably at space rates. Other Unionist issues have fared no better than Home Rule. The referendum was never a healthy child; if, indeed, according to the *Morning Post*, it did not come into the world stillborn. Imperial Preference, according to latest reports, has been pitched overboard by the *Daily Mail;* with it goes, presumably, the whole business of Tariff Reform. Unionist opinion on the reform of the House of Lords is a welter; like men doomed, the peers are speaking with many tongues. Worst of all for the Conservatives is the way in which they have exposed themselves to the charge of not keeping faith with the country. Lord Rosebery's ante-election scheme of Upper House reform, like Mr. Balfour's ante-election referendum, has not the backing of the party, and, in the eyes of Mr. David Lloyd George, falls into the class of the unsuccessful election "dodge."

Absolute cohesiveness does not characterize the new French Ministry. M. Jaurès and his followers are represented as receiving the Cabinet with hearty approval. Yet the most conspicuous among the new Ministers is Delcassé, who stands for an aggressive foreign policy, such as the Socialists oppose, and is regarded with special disfavor in Germany, with which M. Jaurès has long urged his countrymen to come to a friendly understanding. The Monis Cabinet, therefore, clearly shows the haste with which it was put together. It is not exactly a composite Cabinet, since the Radical element in it, counting by mere numbers, is predominant. It was bound to be that, under the existing party alignment in Parliament. But the presence of Delcassé in the Cabinet is a gage to the moderate section of the Government majority. With Delcassé putting new life into the badly disorganized Naval Department, and influencing foreign policy by virtue of his former services, the new Monis Cabinet will have gone far toward meeting the demand from conservative Republican ranks for a more efficient policy of national defence. On the other hand, through M. Caillaux, the father of the Income Tax bill, passed by the Chamber, and now being debated in the Senate, and through Paul Boncour, an advocate of the obligatory organization of Government employees into trade-unions, a good-sized olive branch has been extended to the Extreme Left.

ENMITIES WITHOUT PRINCIPLES.

Close observers of the clashes and turmoil with which the session of Congress has ended must have been reminded of Macaulay's description, in his essay on Chatham, of the confusion of English parties during the latter half of the eighteenth century. Whig and Tory fought with the ferocity of the beings that Dante saw struggling in Malebolge, yet like them "each gradually took the shape and color of its foe." The explanation was, according to Macaulay, that "it is the nature of parties to retain their original enmities far more firmly than their original principles." To-day at Washington there may be some doubt about the principles exhibited, but there can be none about the enmities. Party lines are broken across in both Senate and House on one subject after another; political convictions seem to be put on and off as easily as an old glove; but personal bitterness and animosity between factions are intense almost beyond precedent.

Something of this may be charitably attributed to the overwrought nerves of Congressmen. The crowded hours of glorious life in the last days of an expiring session bring their inevitable strain. The sweet tempers of Senators may be made temporarily irascible by laborious days and nights with no sleep except in cat-naps. And there is also the upsetting effect of legislative uncertainties; the struggle over what bills to jettison and what to cling to; manœuvres for position; the secret conferring and plotting and the perfecting of "gentlemen's agreements" which enrage even those making them—to say nothing of the others. All these nerve-racking and manners-destroying disturbances of a dying Congress must have fair allowance, but even when we write off the due abatement on this score, the spectacle which Congress has just presented in its final scramble is not inspiring. It is not simply that parties were confused and leaders at cross-purposes, but that no clear line of policy or definite principle of public action seems anywhere to have emerged.

A special cause of upheaval was unquestionably the project of reciprocal trade with Canada which President Taft so unexpectedly urged upon Congress. It was a veritable dissolvent. His own party in the House was divided by it into two almost equal factions, and the Senate was similarly torn. There, however, a peculiar root of bitterness lay in the suddenness and completeness with which Mr. Taft turned the tables on the insurgent Republicans. That was an incident of the undertaking with Canada, which he may or may not have taken into his reckoning, but which, in any event, has been one of its most dramatic effects. To men who had made complaints of high tariff rates a good part of their oratorical stock in trade, and who had attacked the President openly and repeatedly for having done nothing to lighten the burden of protective duties and ease the cost of living, he presented a measure aiming to do both those things, in a speedy and effective way. The first effect was to fill them with consternation and strike them dumb. But they did not lose their hostility to the President, even if they lost their voices for a time; and presently they made it apparent that they would oppose a plan which, if they were to be morally consistent, they were bound heartily to support. It has been a most depressing exhibition on their part. Good-natured Americans at first laughed at Cummins and La Follette for having been so neatly "dished" by the President, but there is more in it than a laughing-matter when public men retreat from positions which they had taken on high moral grounds, and show that they are governed more by animosity than by principle. And the people are both shrewd and fair in passing judgment on these things. The Senators we have mentioned may retain their political hold in their own States, but it is certain that their standing with the country has been grievously impaired by their running away from their professed convictions on this question of freer trade with Canada. If La Follette should soon venture to speak of the need of revising the tariff so as to do something for "God's patient poor," or Senator Cummins to repeat his speeches on the enormity of a high tariff, ridicule would be sure to be the lot of either.

Even the Republicans in Congress who make great pretensions of supporting the President behaved ill in this business of Canadian reciprocity. Lukewarmness and secret malevolence are sometimes worse than open antagonism. And one has but to read even friendly accounts of the activities of some of the Senators who were supposed to be working hard for the Canadian agreement, to discover how little heart and sincerity they put into their advocacy. Their chief way of holding up the hands of Mr. Taft was going to him to urge him to fold his hands; to consent weakly to a farcical vote; to give up or put off the extra session; to think of the damage which may be done to his party rather than of the good that may be done to his country. There seems to be little doubt that if the Republicans in the Senate who were half-heartedly for the trade arrangement with Canada had been willing to go into the fight with energy and determination, they could have forced the matter to a vote. The Republican party will deservedly suffer, and its leaders will suffer, for having left so deeply upon the nation the impression that pique and enmity and petty motives have been stronger in this Congress than any considerations of a broad and truly national policy.

THE DEMOCRATIC PROGRAMME.

The country has said good-bye to the Sixty-first Congress with the general verdict: "Ill done, bad and faithless servant!" But with this riddance effected, thoughts are turning to the Sixty-second Congress so soon to assemble. Especially is attention given to every indication of what may be the policy of the leaders of the Democratic House. For upon their decision will depend not only the course of legislation and the length and temper of the extra session, but also in a large degree the course of national politics. Counsels are evidently somewhat divided, although a "tentative programme" has been put forth at Washington. This may be nothing more than a "feeler." In any event, it is of the first importance that those who are to be in control of the next House should not let April 4 find them without plans maturely framed and a determination to hold firmly to what has been agreed upon. A merely opportunist session—drifting and rudderless—is of all things to be avoided.

Two rival theories are broached respecting the general scope which should be given to the extra session. One view is that it should be short and business-like; that it should quickly pass the

reciprocity agreement and a few tariff amendments, and then promptly adjourn. Another opinion, however, is held by some Democratic Representatives. They would do the things just specified, but would attempt many more. In their judgment it would be wise to undertake an extensive revision of the tariff, together with other matters of general legislation, while they would have committees put to work investigating all branches of the government, thus dragging the session over the summer and into the autumn, if need be. But the weight of numbers and also of sagacity appears to be distinctly against this plan, and it is well that it should be. Even if the Democrats had both houses of Congress and the President, the country would be in no mood to tolerate a long-drawn session; and if it is simply a question of staying on in Washington for weary months hunting for possible scandals (and the party capital involved in them) and passing bills which it is known in advance that the Senate will not accept, there can be no doubt whatever that the procedure would be justly regarded as a waste of time and money and the popular patience.

The extra session is called by the President to enact the trade agreement with Canada, and the Democrats of the House should pass the bill at as early a date as possible and send it to the Senate without amendment or "rider" of any kind. To amend it is, of course, to defeat it; while to fasten some other measure or measures to it is to cover up the naked issue. The Democrats should make haste to accept the Canadian offer intact, first, because public sentiment demands it; secondly, because they are committed to it, and thirdly, because it is the shrewdest thing they can do politically. They saw last month how like a sword thrust into the vitals of the protectionist party is this arrangement with Canada for freer trade. What could be sounder party policy than for the Democrats to drive it home? Certainly it will not be the Democratic party that will suffer in the eyes of the country if President Taft has to depend upon his political opponents for securing legislation which the Republicans are too split up and too tied up to give him.

After clean and prompt action on Canadian reciprocity, the Democrats may well take up a few of the more offensive schedules in the Payne-Aldrich tariff. In this work the guiding principle is not so clear. Some argue that no tariff amendments should be passed by the House which there is not good reason to think the Senate will agree to and the President will sign. Others contend that the whole law should be torn to pieces and a radical tariff revision pressed to vote, whether the Republicans will bear or forbear. But there is a wise mean between these two extremes, and in it lies the path of safety. Certain changes in the tariff can be attempted with a fair expectation that they will succeed in becoming law. President Taft has publicly declared the existing woollen schedule to be "indefensible," and a deep cut in its duties would therefore be both strategic and justified. Similarly there might be hopeful efforts to revise the cotton schedules, and to remove a number of tariff taxes on the necessaries of life. In addition, it might be advisable to indicate, by bill or resolution, some other tariff reductions and abolitions which the Democratic party would undertake if it had full power. But beyond this it would be folly to go. A long session given up to interminable and profitless tariff debates leading nowhither would be a mistake so huge that even the Democratic leaders ought to be able to avoid it.

What they should keep clearly and continuously in their minds as they approach and enter the extra session is that it is going to be a time of severe trial and testing for them. They are as far as possible from having had from the country a vote of confidence. All that has been given is a vote of want of confidence in the Republicans. The Democrats have merely an opportunity.

THE STATUS OF THE PROFESSOR.

That the American college president fulfils a function and exercises a degree of power that has no parallel in the institutions of learning of the old world has been asserted so often and, so far as we know, has met with so little contradiction, that it is pleasing to find two leading representatives of the college presidency not so much justifying this peculiarity, but rather denying its existence. In the *Popular Science Monthly* for March the editor, in an article under the title "About Dismissing Professors," quotes a comment of President Butler's upon the following remark made in these columns some months ago, in reference to the plans of Reed College, the promising new institution about to be established in Oregon:

> There is a fine opening for a new institution to show what a college can be wherein the personal domination by the president is abandoned, and in its stead we have a company of gentlemen and scholars working together, with the president simply as the efficient centre of inspiration and coöperation.

"The condition described in the last four lines," says President Butler, "is precisely what is to be found at every American college and university that is worthy of the name, and no evidence to the contrary has ever been produced by anybody."

The other utterance to which we have reference is the address delivered by President Van Hise at the recent meeting of the Association of American Universities at Charlottesville, which appears in *Science* for February 17. Doctor Van Hise makes out a very good case for the necessity of the presidential functions, a not inconsiderable part of which case consists in pointing out the extent to which, in many of our colleges and universities, those functions, so far as appointment and promotion are concerned, are exercised only in cooperation with the faculty. If anybody was under the impression that the American college president exercised his powers in the spirit of an Oriental monarch habitually putting this man up and that man down, as suited his pleasure or whim, certainly the facts stated by Doctor Van Hise must show him that he was in error.

The fact remains, however, that in our American colleges the president is not "*simply* the efficient centre of inspiration and coöperation," but is in large measure thought of, and thinks of himself, as the master, or the foreman, or the captain, of a body of men working under his direction; and this fact has a potent influence on the whole character and spirit of academic life in America. The idea of administration, of coördination, of "harmony," plays a part in most of our colleges and universities altogether disproportionate to its value. Nor is the objection to this state of things merely negative. There is positive harm of the most serious kind in

that submergence of self-assertive personality on the part of the professors which inevitably goes with it. It is not an accident that President Van Hise habitually speaks of "the instructional force of the university"; he instinctively thinks of the professors not as an assemblage of individuals, each expected primarily to do his own work in his own way, but as a "force" of employees jointly engaged in the production of a certain output. Nor is it easy to imagine a man who regards himself as "simply the efficient centre of inspiration and coöperation" of the faculty using this language, which appears in an editorial article in the *Educational Review:*

> Truly the academic animal is a queer beast. If he cannot have something at which to growl and snarl, he will growl and snarl at nothing at all.

Whether or not a bill of particulars could be made out, such as would satisfy a judge and jury, in support of the proposition that the presidents of most American colleges dominate them in the way that is generally asserted, we cannot undertake to say. Evidences of a less definite nature, but to our mind quite convincing, are sufficiently abundant. We do not say that it is personally the fault of the presidents; it may be quite as much the fault of the professors, or the fault of something in the national make-up. It may in part be due to the same traits of national character which result in the extraordinary power of the political boss and in the amazing concentration of financial and industrial control in the hands of a few men. But that no need of our university world is keener than the need of an increase in the personal importance, dignity, and self-assertion of the professor, we are profoundly convinced. And it is encouraging to note that on every hand when the issue arises sentiment is strongly manifested on the right side. The dismissal of Professor Ross from Leland Stanford found nowhere stronger condemnation than among men thoroughly out of sympathy with his economic views, but deeply conscious of the importance of professorial independence. The report recently made to the Carnegie Foundation by a mechanical engineer was at once recognized everywhere as a *reductio ad absurdum* of the idea that colleges and universities should be conducted on machine-shop principles. The attempt to get the maximum of efficiency at every point by the exercise of supervision and control, even when not carried to that ridiculous extreme, is destructive of that vitality upon which the true efficiency of a university depends, and which resides in the inherent personal qualities of its professors. It is the permanence of tenure of professors, the undisputed dignity and honor of their position, that have made the great universities of the Old World what they are. And no substitute for the vitalizing influence of these essential elements can be provided by any amount of supervisory meddling or administrative perfection.

THE EMERGENCE OF AUTHORS.

In the latest discourse from the Easy Chair, Mr. William Dean Howells complains whimsically of the people who approach you with a volume in the hand and an eager look in the eye and ask you if you have ever read anything by this new man, Arnold Bennett. Mr. Howells feels called upon to vindicate his reputation as an old voyager in the "uncharted literary seas." He has known Mr. Bennett's work for ever so many years, and he admired the Englishman's talent long before fortune's capricious wave caught him up and landed him high on the hot and baking beach of popularity, only a year or two ago. The Easy Chair proceeds to put an extraordinarily high valuation on Mr. Bennett's novels, without stopping to ask why such good work should have been so long in winning recognition. Yet the case of Arnold Bennett is typical—for England more than for this country, but for us, too, to an unsuspected degree. Observe that this is not the old case of manuscripts knocking at publishers' doors in vain. If it is success to get one's novel into print, Mr. Bennett attained success a dozen years ago. Here is the more remarkable case of nearly a score of printed books of an exceptionally high degree of merit, waiting patiently for justice, or luck, or whim, or whatever power it is that at last gives literary talent its due.

Just to what degree the case of Arnold Bennett is typical of contemporary British writers, the following few names may show. Eden Phillpotts, who in his younger days collaborated with Arnold Bennett, has more than two dozen books to his credit, and of these only a half-dozen have been written since his emergence into broad public notice. W. J. Locke published nine or ten novels before "The Beloved Vagabond." John Galsworthy had written a half-dozen volumes of sketches, novels, and plays, before "The Silver Box" came out, only five years ago. Bernard Shaw began writing about 1880; his "Plays Pleasant and Unpleasant" appeared only in 1898, and the "boom" days of the inimitable G. B. S. did not come till Arnold Daly produced "Candida" in New York eight years ago. Even the meteoric Chesterton rose on the firmament with the comparatively sedate speed which we naturally expect in a British meteor; he had written five books before his "Browning" first drew the world's attention. It may seem straining the point to bring in the greatest figure of them all, Thomas Hardy. Yet to the mass of young readers, Hardy to-day is the author of "Tess" and "Jude." But Hardy had begun writing in 1865 and published at least fifteen volumes before the appearance of "Tess of the D'Urbervilles" in 1891. That Hardy's earliest books comprise his best work, does not destroy the argument. The fact remains that when Hardy wrote "A Pair of Blue Eyes," "The Return of the Native," and "The Woodlanders," he had only a following. With "Tess" he won a public. If one were to yield to the temptation of venturing into unknown seas, the prophecy might be hazarded that some day the public will discover Mr. Charles Marriott, whose fifteen novels have not yet gained him the recognition which his admirable talent deserves.

How is it with us in this country? A detailed statistical study would show that success comes more speedily to the American novelist than to the Englishman. Care must be exercised in drawing up our list of names. If we are to take the "best-sellers" only, the point is proved at the start. Most of our "best-sellers" have been first books or early books; many of them have been, in fact, the writer's only book, a literary flash-in-the-pan and that is all. But draw up a fairly representative list of names, a list that shall include Edith Wharton, Robert Herrick, Frank Norris, Jack London, Winston Churchill, Robert Chambers, and Booth Tarkington. Frank Norris wrote four or five stories before he published "The Octopus," but these four or five stories were written within

two or three years; so that we cannot call his fame long delayed. Tarkington won at the first try with "The Gentleman from Indiana." Winston Churchill was almost as prompt; "Richard Carvel" was his second book. Jack London wrote a half-dozen books before "The Call of the Wild," but was already very well known before that. Robert Chambers seems to be one of those men who, in a now famous phrase, are able to "come back." His "King in Yellow," of eighteen years ago, brought him reputation; then came a long decline, followed by a sharp reascendence which we may date from the "Iole" of six years ago. In the case of Robert Herrick and Mrs. Wharton, we find the expected; their work is of a more serious nature and was slower in making its way. Mrs. Wharton is credited with eight books before the "House of Mirth," though probably we should put the date of her emergence three years earlier at "The Valley of Decision." Mr. Herrick had written nine or ten books before the publication of "The Memoirs of an American Citizen." It will be seen that even Mr. Herrick's or Mrs. Wharton's apprenticeship to fame was much shorter than that of most of the English writers we have mentioned.

It would not do to press the distinction too far. This year or the next may see the emergence in this country of an author who has hurled a dozen volumes against the gates of fame without bursting them asunder. England shows us, on the other hand, a phenomenon like De Morgan—although in his case, it might be argued that De Morgan must have lived a great many novels, even if he did not write them, and that "Joseph Vance" is not really his first book; or shows us a one-book man, like E. F. Benson, who made his "hit" with "Dodo" nearly twenty years ago, and has never risen so high again in no less than twenty-five attempts. But broadly speaking, the distinction between American and English authorship holds. Our writers "win out" more easily.

WEALTH AND IDEALISM.

The ordinary exhortation directed to rich men is, it must be confessed, apt to be both flat and unprofitable. It is too much like guides to fashionable society written by old maids in a fifth-floor hall bedroom. That is to say, there is too little fellow-feeling about it, too alien a point of view, not enough knowledge of the facts from the inside. Most clergymen and moralists are poor men, by hypothesis, yet they are the ones who oftenest appeal to the wealthy and endeavor to waken them to their opportunity and duty. The result must create in the minds of the persons addressed a sense of strangeness. "The fellow doesn't know what he is talking about," we can easily imagine them saying. But they would never think of saying it to Major Henry L. Higginson, who has an article in the March *Atlantic*, "A Word to the Rich." This author knows at least what great possessions are from personal experience, and hence his language is not that of one moving about in a world not realized.

Major Higginson's article is somewhat discursive—not to say disconnected—but through it all there runs a fine insistence upon the one thing needful. This is that rich men should not allow themselves to be crushed under the heaps of their own gold, but should preserve, along with the sense of power and the command of luxury which their wealth gives them, a sort of personal and public idealism in which they may find keener and more durable satisfaction than in great riches. Identifying himself with the men of his own generation, Major Higginson recalls the generous enthusiasms and patriotic kindlings which inspired the youth of this country in the years just before the civil war, and makes it clear that he regards such aspirations for service and promptings to spend one's self in great causes as more precious than rubies.

There is implied, too, in Major Higginson's article an argument which is at least as old as Solomon, but which is capable of being put with fresh power in the case of all forms of self-indulgence by the moderns. It is the argument from satiety. The exceeding weariness of sin is not so frequent a topic in the pulpit as the exceeding sinfulness, but it is one which might oftener be expounded to edification. And certainly no aspect of the strivings of those who heap up money without knowing how to expend it except in ostentation, is more notable than the fact that they get insufferably bored by the whole process and entanglement of their luxurious living. One cannot have more than so many automobiles, yachts, country-places, pictures, libraries, jewels, and when they are piled up simply for their own sake, it must be a common experience to feel that only labor and sorrow have gone into the accumulation and that even the enjoyment of them is perilously near a sensation of being satiated. A wealthy man must crave variety as much as another, and the mere outlay of great sums in the ordinary ways soon ceases to have any novelty about it. Walter Bagehot said that it was an inspiring discovery to an English nobleman to find that nothing in the world was so much fun as work; and Major Higginson plainly intimates that a great many rich men are in need of some object outside of themselves and their families and their business upon which to wreak their latent idealism. They need it for their own good. The "hopeless rich," as they have been called, are so because their very abundance takes the zest out of life. Struggle is tonic for us all; and when a man has no longer to strive in order to make a fortune, he may still get the benefit of effort and the pleasure of contest by flinging himself into some arduous work of philanthropy or social reform. Out of what he spends merely of his money for such purposes, he will get much more than he possibly can from any personal extravagance. Rich men need quickening ideals to cherish and realize, as much as the country needs rich men with such ideals.

There is one matter which Major Higginson does not definitely go into, though it is latent in his article. We mean the chance which men of great wealth have to meet and break attacks upon their class by a noble use of their large means. We do not believe in attempting to classify men and women by social ranks. Passions, ambitions, weaknesses, virtues are much the same in all walks of life. Avarice and greed are as often met among the poor as among the rich. But there are certain defects of human nature, certain vices even, which the possession of great wealth may make more conspicuous and more hateful. Senseless display, a crass materialism, the plunging year after year into a round of pleasure-seeking, an apparent cool ignoring of the fact that mighty evils threaten and great causes beckon—all these things are made doubly repellent when the very rich practise them on a great scale and in a glittering light. And the surest escape

from them is the steadier cultivation among those with great fortunes at command, first of the perception that all this mammon-worship is essentially vulgar, and then of the conviction that they need to marry idealism to their wealth. Let them more often employ their riches upon the things of the spirit—culture through books and art and music—and let them also know the joy of combat with social and political dangers—with disease and ignorance and crime and corruption—and they will not only be stopping the mouth of the scorner but filling their own hearts with a new sense of the happiness and dignity of life.

THE CRETAN DISK.

LONDON, February 21.

It is not often that an "antiquarian old womanry" (as Sir Walter Scott says) illustrates the workings of the human intelligence and its liability to "suggestion" so strangely as does Dr. Hempl's article "The Solving of an Ancient Riddle" (*Harper's Magazine*, January). The riddle is the picture-writing stamped on a disk of clay found at Phæstus in Crete. The pictures of the costume of men and women are like nothing known to us in the art of prehistoric Crete; the dirk is unlike a Cretan dirk, the ship has no mast and is not like ships in Cretan art. But all the objects are well and freely drawn, though the fat woman is designed with no flattering hand. The date is supposed to be not later than 1600 B. C.

We do not know what people used this kind of picture-writing, or rather printing. But one thing seems certain and another thing probable. Each set of signs within its little framework stands for a word. Next, as Edouard Meyer had observed before Dr. Hempl made the same conjecture, an oblique stroke under some of the characters probably answers to the *virâma* in Sanskrit, and, if so, cancels an *a* implied as the vowel in a sign standing for a consonant and a vowel, say *ta*, for example. Thus it is a fair working guess that each sign stands for a *syllable*, as in the characters which the people of Cyprus used long after the rest of Greece wrote in the Greek alphabet.

Dr. Hempl knew no language except Greek which might be current in the eastern Mediterranean about 1600 B. C. We know that in Crete much later, and in Cyprus (probably), one non-Greek Indo-European language was used, if not two; but, as no one understands that tongue, Dr. Hempl tried Greek in his experiments. Some of the pictures, as of a man's head, a woman, a little boy, a ship, a shield, a tunny fish, a hide, an axe, were unmistakable, and the first syllable of a Greek word for each could be tentatively used where such characters occurred. But there are at least a dozen signs which represent objects of unknown or doubtful nature. We can only guess at the names of the plants and of several enigmatic objects. In more than a dozen cases out of forty-five signs, it seems to have been necessary to find syllables that would fit in with those taken as provisionally ascertained, and then to look in the dictionary for words beginning with these syllables, words that might be names for the enigmatic objects represented.

What Dr. Hempl takes the names of some of the odd objects to be, I cannot even guess: for example, a thing that might be a knobby mace with a smooth handle, or might be an eccentric flageolet; and another that might be a key with two "business ends," or a comb, or even a schematized fortification. The head of a man, either wearing an earring resembling the figure of eight, or tattooed with a figure of eight—how are we to know the name of this sign? The figure of eight (8) is the sign for *le* in the writing of Cyprus, but that does not carry us far.

However he managed it in these cases, Dr. Hempl made out the forty-five signs to his own satisfaction, and published a transliteration into Greek characters, and a translation, of the first nineteen words.

I was much interested and consulted better scholars than myself. They said that all was guesswork, but one archæologist added that there was no way except guessing. Still, when Dr. Hempl guessed that a sign meant a water lily (*nymphaion*), where Arthur Evans saw a star anemone; and guessed a lily (*souson*), where I and Mr. Evans and Dr. Pernier saw a saffron flower (the result being to give either *kroto* or *soto*), while some words as *labropodês* (for a man supposed to be running, though he may be doing something else) could not be early Greek, the whole affair began to waver like a vain dream.

Again, the learned said that the words produced "were not Greek," and I could only reply that they might once have been Greek—which was not reckoned satisfactory. Again, skeptics asked, Is it likely that eight words out of nineteen should begin with the preposition *apo* (meaning "from")? To this I could only reply that granting the words to be words, whatever the language, eight out of nineteen words *did* begin with the two characters rendered *apo* by Dr. Hempl.

Not one of the eminent scholars made an experiment by applying Dr. Hempl's syllables to the side of the disk which he did not translate. To do this was left to an ingenious amateur. He told me that the operation was "as easy as shelling peas," and produced a Greek transliteration which he kindly translated. Again, the Greek was very, very unusual Greek, and "the statements" made in it "were tough." Still, two curious points came out: First, the process yielded the proper names Athene, Mamersa, and the amateur discovered, what neither of us had known, that Mamersa *was* an old cult name of the goddess Athene. Here, we said, is a coincidence that can scarcely be the result of mere chance: there *is* Greek at the bottom of this! Secondly, it was found that the vowels coming after each of two double consonants (as *pt rg*) followed certain rules observed (though we had not known it) in the Cyprian form of writing in syllabic characters. The rules are too intricate to be explained here, but they were followed by the picture-writing. None the less, the results in words were very eccentric, and described some extremely peculiar proceedings.

Now a change came o'er the spirit of our dream, a fatal change! We had never liked the eight *apos* or "froms" in nineteen words. We had guessed that one word could only occur so often, if it were an exclamation, like *Aoi* in the "Chanson de Roland," or an invocation, like "Lord!" in our Litany. At this point, to quote an old Greek epic, "came the Amazon." Dr. Hempl had got his eternal *apo* by supposing the crested head of a man to stand for *anêr*, and taking the *a* of that word; while he conceived *boagrion* to be the Greek word for the round shield, turned *bo* into *po*, and thus obtained *apo*. But now the Amazon, a young lady of much erudition, said, "Take the *an* not the *a* from *anêr*, and take *sakos* as the Greek word for the shield, and you have *ansa*, not *apo*."

But here comes in the artfulness! You cannot, if you are writing in signs which denote not letters but syllables, write *ansa*. The double consonants (*ns*) can, in syllabic writing, only be *anasa*, or rather *an-as-sa*. *Anassa* in Greek means "Queen"; we have Athene in Dr. Hempl's version, and *Anassa*, "Queen!" like our "Lord!" is a repeated invocation to a divine being, Athene in this case.

This, it will perhaps be admitted, is neat and good. But, whatever syllables the two signs—the crested head and the shield—really stood for, one thing becomes clear. Every Greek object had several names. Though the crested head is that of a man, it is also that of a warrior, *hêrôs*, *polemistês*, or what you please. The word *boagrion* for a shield occurs but once in the Iliad, while *sakos* and *aspis* for a shield occur as often as a shield has to be mentioned, and so on with the other objects. The stout matronly lady may stand, not for *gunê* "woman," but for *mêtêr* or *maia*, "mother" or "nurse." The little naked boy need not be *pais*, he may be *nêpios*. The female breast need not be *ta* (indeed, I do not know what it should be), but *ma; maza* being Greek for a breast.

The bird of prey need not be a hawk, but, as Mr. Evans thinks, an eagle; and that yields a syllable which does not suit Dr. Hempl.

The amateurs now threw most of Dr. Hempl's syllables to the winds; chose, on his own principles, other syllables derived from other names for the objects designed in the picture-writing; got rid of his "robber," and his "spoils," and his imposing "Zeus," and his "silence," and produced quite a pious and pleasing invocation to Athene. But the whole decipherment and interpretation changes color hour by hour like a chameleon, while the amateurs laugh frequently over their own results.

Nothing may come of these amusing experiments, for I do not see how we can ever be sure that any interpretation is the right one. But experiment is so far valuable that it seems to prove the entirely hazardous and arbitrary nature of the whole method of decipherment. Unluckily there is, at present, no other method open to us. ANDREW LANG.

FRIEDRICH SPIELHAGEN.

The novelist who passed away in Berlin on the twenty-fourth of February, —his eighty-second birthday—was the last representative of a remarkable epoch in German literature. In the decade of 1850 to 1860 appeared three novels which deeply stirred the public mind of Germany—Gutzkow's "Ritter vom Geiste," Freytag's "Soll und Haben," and Spielhagen's "Problematische Naturen." All these novels became part of the liberal gospel of Germany, which, unable to make itself heard in the political arena during the period of reaction following 1848, found expression in literature. Gutzkow had been one of the leaders of Young Germany, of whose poets and writers of fiction Börne could say, with considerable justice: "In Germany, literature has always served as a vent to politics." The "Ritter vom Geiste," like Gutzkow's subsequent "Zauberer von Rom," owed its literary effectiveness largely to its being a powerful political tract; Freytag's "Soll und Haben," with its pictures of social contrasts, was invested by the public with a political significance which, intrinsically, it never possessed; Spielhagen's "Problematische Naturen" alone was enjoyed both for its political background and its fascination as a story.

Up to the time of the publication of this novel, in 1860, Spielhagen had led the typical life of the German student, struggling toward the pursuit of literature. He began the study of law, then turned to philology and philosophy, tried his hand at teaching, wrote verses, and published translations from foreign languages. In his volume of reminiscences ("Finder und Erfinder"), he speaks of the enthusiasm with which he took up the translation of American writers. He rendered into German George W. Curtis's "Nile Notes of a Howadji," and Emerson's "English Traits," and published a volume of "Amerikanische Gedichte." In a recent letter to the New York *Staats-Zeitung*, he referred with modest simplicity to his interest in American literature more than half a century ago. None of his early literary ventures was pecuniarily successful, and his discouragement, sharpened by the sad outcome of his historic attempts, led him to rid himself, Goethe-like, of his regrets and world-weariness by giving them a literary form. He himself was to be the hero of his novel, the "Problematische Naturen," whose title he borrowed from one of Goethe's aphorisms.

The success of this work was not confined to Germany. It was translated into many languages, and in England and Russia in particular it was taken up as a mirror of German civilization, and gave rise to much philosophical speculation. Yet the problematic characters of the novel are as old and universal as human doubt and weakness and the protest of the unsuccessful against the existing order. But what captivated the German public was the new setting given to the irresistible Byronic Don Juans and unhappy Wilhelm Meisters, who, at the close of the story, mount the barricades of the revolution of 1848, and in their heroic death atone for their useless lives; while readers beyond the fatherland were won more by the vivid scenic effects in which Spielhagen always excelled than by his fervent denunciation of the barriers between the German middle class and the aristocracy.

Spielhagen possessed, in a far greater degree than either Gutzkow or Freytag, the ability to read in the book of Nature. He had the gift of weaving natural phenomena into the framework of his story, so as to make them serve an allegorical purpose. He knew both the mountains and the sea thoroughly, and his descriptive power was very considerable. In his "Hammer und Amboss" (Hammer and Anvil) there is a famous scene in which a raging storm in the Baltic is utilized to show the power of a noble-minded director of a prison to sway the emotions of its inmates, and compel them to erect barriers against the advancing tide, thereby saving the lives of the villagers at the risk of their own.

The antagonism between democracy and conservatism appeared again, accentuated still more strongly, in "Die von Hohenstein"—a gloomy picture of a degenerate aristocratic family, with the revolution of 1848 as its background. Several other of the subsequent novels, "In Reih und Glied," "Allzeit voran," and "Ultimo," deal largely with political questions of the day, while "Sturmflut" typifies the economic crash of 1873. "Hammer und Amboss," with its glorification of labor as the panacea for all social evils, is reminiscent of Freytag's "Soll und Haben." In all these novels the obvious *Tendenz* is subordinated to the interest of the plot. Spielhagen was a born story-teller and held his readers throughout his long novels, with all their frequent verbosity, by his skill in grouping numerous sharply defined episodic characters around the central figures, and, above all, by effective appeals to German sentiment. He was less successful in his portrayal of the men of the day whom he here and there attempted to introduce, or at least intended to suggest. Thus, one of the characters of "In Reih und Glied" inevitably recalls Lassalle, but the picture of the socialist leader is blurred and unimpressive, either as truth or fiction. There is much charm, of a simpler and more direct kind, in his shorter novels, such as "Was die Schwalbe sang."

As a dramatist, Spielhagen never rose to the importance of Gutzkow and Freytag, nor are his æsthetic writings likely to survive. But his influence on his time was undeniably great, and it is to be hoped that the example of his idealism, modesty, and fidelity to principle may not be lost upon a later generation. He retained to the end many of the characteristics which distinguished him in his student days, when, as his colleague, Adolf Strodtmann, said, he "always spouted Goethe, Shakespeare, Homer, and Sophocles." His friendships were notable. He early appreciated Carl Schurz, whose fellow-student he was at Bonn, and he was firmly attached to Berthold Auerbach. In his preface to "Auerbach's Briefe an seinen Freund Jakob Auerbach" he paid a glowing tribute to the novelist whose talent and ideals were kindred to his own. But unlike Auerbach and Gustav Freytag, Spielhagen never gave his full adhesion to the new Germany. He remained in many ways the old Forty-eighter. His attitude toward the later literary currents in Germany was, however, one of sympathy. In the preface to his reminiscences he welcomes any honest effort to seize the subjects of the hour, provided the poetic impulse, whether idealistic or realistic, be genuine.

Much has been said of the indebtedness of Spielhagen to foreign models. "Hammer und Amboss," in particular, has been traced to the influence of George Sand, and, with more justice, to that of Dickens. There is undoubtedly a more than accidental resemblance—in the autobiographic form, the double marriage of the hero, the character of the heroine—to "David Copperfield"; but the two novels, needless to say, are wide apart in treatment and artistic value. German criticism has always been prone to force the note of resemblance between the novelists of Germany and those of other countries. The truth is that German literature, rich as

it is in so many fields, has neither a Dickens, nor a Balzac, nor a Tolstoy—perhaps not even a Sue, to whom, in some features, Spielhagen might have been compared. The greatest of German novelists have been overpraised by their patriotic compeers. Gottfried Keller has been called by Heyse the "Shakespeare of the novel," and of what indiscriminate laudation has not Heyse himself, refined and artistic as he is, been the subject. It may be doubted whether either Gutzkow, or Freytag, or Spielhagen himself will long live in literature, at least in the world-literature of Goethe. Of all the German writers of fiction who found fruitful themes in a time of political foment, and amid petty surroundings, perhaps Fritz Reuter, the Low German humorist, is alone to be permanently numbered among the classics. Humor is a great preservative. But who can tell? There is, says Sainte-Beuve, no recipe for making a classic.

GUSTAV POLLAK.

NEWS FOR BIBLIOPHILES.

Under the title of "The Romance of Book-Selling," Frank A. Mumby has published, through Chapman & Hall, a history of bookselling and book-publishing in England since Anglo-Saxon days to the present time. In a preliminary chapter also is included some account of the books of the ancients and the beginnings of book-publishing in Greece and Rome. In his octavo of upwards of five hundred pages, he has gathered from various sources much interesting history relative to the restrictions which the authorities put upon printers and booksellers in the days of Queen Mary, Queen Elizabeth, James I, and Charles I. Dryden and Tonson come in, Pope and Curll, Dr. Johnson and Dodsley, and so down to the *Times* Book Club, the formation of which was an event that upset the English book trade more than anything else in recent years. Early decrees and documents are reprinted, mainly from Arber's "Transcripts of the Stationers' Register," and reproductions of old title-pages and portraits are numerous. The latter portion of the book treats of the last half-century and the principal English publishing houses of the present day, the Longmans, the Murrays, the Macmillans, Chapman & Hall, William Heinemann, and others; portraits of many of the present heads of these houses being given. A Bibliography of forty pages and an Index complete the book.

The first volume of the "Minutes of the Executive Council of the Province of New York," 1668-1673, the latest work of our able State historian, Victor Hugo Paltsits, while primarily for the historical student, is a book to interest also the collector of New York material, if for no other reason certainly for the reproduction, size of the original, of the large plan of Manhattan Island, made during the Governorship of Richard Nicolls and generally called the Nicolls map. Among other reproductions in the volume are Robert Rider's survey of Long Island, 1670, from the original in the collection of the New York Historical Society; the articles of surrender of New Netherlands in 1664 (a printed Dutch broadside, from the original in the New York Public Library); and the signatures of witnesses and the marks of the Indians on the deed conveying Staten Island to the colony in 1670. The text of the Council's Minute Book is printed exactly (the types for some of the abbreviations having been specially cut) and profusely annotated. A number of important and collateral and illustrative documents, including several relating to the Island of Nantucket, then included in the colony of New York, have been added.

The Society of Iconophiles has just distributed to members "The Hudson-Fulton Celebration," by Gustav Kobbe, with a preface by William Loring Andrews. It is a handsomely printed square 8vo, of which 106 copies have been printed on hand-made paper and 16 copies on Japan paper. There are six engravings by Francis S. King. It will be sought after by collectors of William Loring Andrews's books.

For many years Prof. George Herbert Palmer of Harvard University has been collecting editions of "The Temple" and other books by or relating to Herbert and his hardly less famous brothers, and he has now printed privately a "Herbert Bibliography," which is, in fact, a catalogue of his own collection. The "Bibliography" is divided into several classes. Group i is made up of biographies of Herbert; Group ii of manuscripts, the two principal items being transcripts of manuscript volumes in the Bodleian Library and in the Williams Library, London. The third group is made up of George Herbert's writings, other than "The Temple." Groups iv and v are editions of "The Temple"; the first, containing sixteen titles, describes the first thirteen editions, printed during the century following Herbert's death, and the second modern editions. Prof. Palmer has not been able to procure a copy of the rare variation of the first editfon with undated title-page, of which there are copies in the Hoe and Huth libraries, and which, ever since the days of Lowndes, has been called the actual first edition. There can be no doubt, however, that the dated title-page was the earlier and the one printed with the beok. Groups vi and vii comprise the writings of the brothers of Herbert and of Nicholas Ferrar, his "spiritual brother." Group viii describes miscellaneous books relating to Herbert, and Group ix a short list of Desiderata. The four titles of books which have eluded Professor Palmer's diligent search are:

"Le Cento & Dieci Divine Considerationi de Juan de Valdes." Basel, 1550.

"De Veritate." By Edward Herbert, Lord Cherbury. Paris, 1624.

"A Translation of Certain Psalms." By Lord Bacon. London, 1625. This was dedicated to Herbert.

"The Synagogue. In Imitation of Mr. George Herbert." [By Christopher Harvey.] London, 1640.

Correspondence

THE SENATORSHIP IN COLORADO.

TO THE EDITOR OF THE NATION:

SIR: It would hardly be possible to produce a more cogent argument in favor of a change in the election of United States Senator than is afforded by the Senatorial contest now going on in this State. Colorado is naturally Republican, that is to say, if all the sections which are inclined to Republican measures could be harmonized, the State would generally vote the Republican ticket. Leaving aside a rather small section of insurgents, there is in the regular ranks a struggle, more or less pronounced, for leadership between the present Senator, Simon Guggenheim, and W. G. Evans. Meanwhile there is a very pronounced division in the Democratic ranks; one section is headed by the present Mayor of Denver, R. W. Speer, who is commonly supposed to work in harmony with the Republican wing, controlled by W. G. Evans, in at least so far as respects the promotion of the interests of the public utility corporation.

Another wing of the Democratic party, known as the "platform" Democrats, because they stand for certain progressive measures advanced in the Democratic platform at the last State election, is led by such men as Gov. Shafroth and Alva Adams, the latter long a prominent man in the Democratic party and an ex-Governor. This section of the party finds expression through the *Rocky Mountain News*, owned and so controlled by former Senator T. M. Patterson, who is a bitter personal enemy of the present Mayor, R. W. Speer.

From this condition of things results the following situation in the Senatorial contest: The Republicans, in the minority in the Legislature, have as their candidate Joel F. Vaile, a man of ability and culture, but a corporation lawyer, and incapable of election unless by Democratic votes. Each wing of the Democratic party has a candidate, Robert W. Speer of the "City Hall" Democrats and Alva Adams of the "platform" Democrats. Other candidates have been announced, but none who has any chance of election except as a compromise candidate, and of such a solution of the contest there is at present no indication. If the election should be made by the people, probably no one of the prominent candidates would stand a chance of election.

Now, what is the determining factor in this contest? Simply and purely the purposes of the "interests." No one will go from Colorado to the United States Senate who is not the servant of the "interests," unless the situation is so prolonged and public opinion, irrespective of party, becomes so aroused as to compel the members of the Legislature to register that will in their choice of a Senator.

One further element comes in to complicate the situation. If Mayor Speer should be elected, he would have either to retain his office of Mayor till the end of his term, more than a year distant, or by resigning allow the control of the city officers and patronage, and the sometimes determining influence of the police on elections, to pass into the control of the Republican party, since his successor, under the city charter, would be a Republican.

In spite of this, however, I think there can be no doubt that the only obstacle to the purchase, directly or indirectly, of enough Republican and "platform" Democratic votes to elect R. W. Speer is the sensitive state of public opinion with respect to bribery in Senatorial elections. With the example before us of the Lorimer investigation and debate in the Senate, it grows

somewhat dangerous to adopt "raw" methods such as formerly were soon forgotten.

SHAKESPEARE'S LEARNING.

To the Editor of The Nation:

Sir: In the last volume of the Shakespeare-Bacon controversy, the argument presented in the "To the Reader" seems fairly to be summarized as follows: The plays are recognized as wonderful; scholars are amazed at the knowledge of the classics in them, lawyers at the law, travellers at the minute accuracy of the descriptions of foreign cities; they show a keen critic of court etiquette and French soldiery; the only possible man of the time with this encyclopædic outlook was Francis Bacon. Both in the original and in the summary there seems a *causal* connection implied, namely, that the plays are wonderful because of the knowledge, and because of the knowledge Bacon is the author. But, stated thus baldly, the fallacy is obvious. It is not because the author "had by study obtained nearly all the learning that could be gained from books" that the Elizabethans went to see the plays, or that we to-day read them; but it is because there is to be found in them wonderful characterization expressed dramatically, namely, before an audience. And this audience is what the scholars seem to forget. For by it is the dramatist limited, since profundity of thought or skill in allusion is good or bad, artistically, exactly in proportion as the thought is comprehended or the allusion understood. Thus the question of the actuality of the "port" at Milan is beside the mark; the dramatist must have assumed that the audience was either ignorant of the geography, or else cognizant of the internal canal system. As the second is not credible, the choice of Milan as the "port" suggests, not a reckless dramatist sporting with his audience, but frankly an ignorant or careless one.

Thus, the time has come to protest, in the name of Shakespeare, against the innumerable notes which disfigure his works. Although, owing to the change in idiom and the transient nature of allusion, some, of course, are necessary, annotations too long have been used as vehicles for the display of the annotator's erudition, that note being the most valued which is farthest afield. This is illustrated by the Shakespearean use of "Hyrcan" tigers in "Macbeth," "Henry VI," and "Hamlet." Turning to the Variorum for the elucidation, you find that one critic refers to Pliny, another to Daniel, another to Riche, while the Clarendon Press edition sapiently gives an account of Hyrcania, and records that in Holland's translation of Pliny the rhinoceros is mentioned on the opposite page. Of course, actually, as Rolfe mildly suggests, the comparison is taken from the 367th line of the Fourth Book of the Æneid, "Caucasus, Hyrcanæque admorunt ubera tigres." As the key word, "Hyrcan," does not appear in Surrey's translation (1557), or in Stanyhurst's (1552) —I have been unable to see the Phaer—we may safely infer that on the part of both author and audience it presupposes a knowledge of Virgil in the original. But this is precisely what we should expect. To a degree impossible for us, with our long background of English classics, and the innumerable outpouring of the daily press, the Æneid was the one great poem of the Renaissance. They studied it in school and they read it in old age. And of all parts of the Æneid the fourth book was precisely the one that captivated their imaginations. Consequently, a comparison drawn from that was exactly as intelligible as "storied windows" or "dim religious light" would be to-day. And the use of it does not imply a first-hand knowledge of either Hyrcania or tigers.

John M. Berdan.

OPEN WINDOWS.

To the Editor of The Nation:

Sir: Well-meaning people unfamiliar with different social planes of life have wondered much that lung and throat diseases increase so rapidly and do so much harm among the poorer classes during the winter months. Medical statistics prove that, with the advent of cold weather, "dirty air" diseases carry off a disastrously large proportion of urban population with startling regularity. This particular sort of mortality ceases in a large degree as soon as warmer weather comes. The inference is drawn, probably correctly, that foul air is the cause. In summer fresh air is admitted to the living and sleeping rooms, and in winter it is not. Throat and lung diseases are prevalent in winter more than in summer. Cause and effect! Remove the cause, and the effect disappears. Let us preach the crusade of fresh air to our ailing brethren, say the social workers. Let us show them the advantages of opening the windows of their dwelling houses and admitting God's fresh air, laden with life-giving oxygen.

The laboring man, with a family to support on $1.75 per diem, does not respond with due alacrity and enthusiasm. He will not open his bed-room window when the thermometer is hovering around zero. In fact, he is very set and obstinate about the matter. The sciolistic philanthropist recoils with disgust. He has pointed out to his ailing brother a remedy, cheap and efficient, that will abate the greatest scourge of modern times: consumption; and the ailing brother will have none of it. So simple, so easy—all you have to do is to raise the window, and you have an end to lung and throat diseases.

Suppose we look at the other side of the question, and examine it from the point of view of the man with a family on a small wage.

Why won't he raise the window in his bedroom at night? The answer is simple and primitive: Because of the cold. Admitting that the outside air is cold, why not put on more bed clothing and keep the body warm while breathing pure but chilly air. Answer: Because the man hasn't the bed clothes. Why can't he get the proper bed clothes? Because they cost too much. What kind of clothing should a man wear in our changeable rigorous Northern climate in winter? Wool, by all means. Is it expensive? So expensive that it is beyond the reach of the poor man; wool is a luxury in the United States. Why do so many poor people come to an untimely death in this country? Answer: The tariff on wool.

GREEK IN THE NEW YORK SCHOOLS.

To the Editor of The Nation:

Sir: The crisis in the final attack of the modern materialistic school of educators upon the humanities has come in New York city. The first blow has fallen in the abolishing of the Greek department of the Flushing High School, No. 20.

I had long been curious to learn whether the English study of the classics or the American training in English subjects really produced the more general reading of English literature. In 1908 I began a systematic attempt to see how far an ignorance of classical mythology might be responsible for the indifference to good reading among the school children of the United States. Taking mixed classes of boys and girls in New York city who were of college age or nearly so, and most of whom were fitting themselves to enter college work, I began to use a series of questions testing each pupil in the amount of information he possessed in those three great literary storehouses of the race, the Scriptures, mythology, and chivalry. The results were discouraging. The objection always brought against Milton was the necessity for using a classical dictionary when reading the "Comus." After weeks of preparation more than half the classes failed upon questions involving mythological names. It is true that the homes represented were often of the peasant or artisan class in Europe, yet the pupils had received their training in American schools and were soon to be counted among the earnest students of American colleges. So it is hard to account for boys of eighteen who had never heard of Venus. Classes were often aghast at being expected to know Apollo without looking him up. Bright youths insisted that Psyche was the inventor of the Psyche knot. Even when Jupiter had been mastered, Jove was described as the queen of love and beauty. Whole classes were occasionally discovered that could not tell the story of Daniel in the lions' den. In other words, questions in English that should prove child's play to pupils who had read Ovid, Virgil, or the Iliad, as well as the Bible, were invariably found to be the severest tests of the memory, and even of the interest, of such young people as now throng our city schools. What a wealth of literary allusion, and of poetic inspiration, must be lost to readers of such limited background.

It has since been possible for me to make a more scientific investigation as to the amount of culture brought by the entering class to a good Eastern college. In 1910, a paper including twelve questions in the Bible and classical mythology was set for the entering class of 150 men in Amherst College. In each series of six, two questions were the easiest that could be thought of, two were exceedingly difficult, so as to test the intimate as well as the average knowledge of the men. Other general statements were asked for, which were answered with much apparent frankness.

The results were amazing. Of the 150 men 35, or 23 per cent., reported little or no

Bible study; 37 were ignorant of Cain; 40 knew nothing of Daniel; 65 failed upon Saul, 102 upon Gideon, 105 upon Timothy. Only 20 answered all six Bible questions correctly. More than 79, or at least 53 per cent., could remember nothing about the fall of Jericho. Nearly the same figures relatively appeared for the easy and difficult names in classical mythology. As many as 27, or 17 per cent., were quite untrained in the classics; 18 were ignorant of Hercules, 59 of Jason; 52, or 34 per cent., were confused about Apollo. As was to be expected, 110 failed to account for both Psyche and old Chiron. On the other hand, it is surprising that 40 men, or 26 per cent. of the 150, could give no information concerning the fall of Troy, although all had studied Latin for three years. Only four men answered all six questions in mythology. Only three students, or 2 per cent. of the whole class, answered all the questions.

These figures are, of course, merely indications, although a repetition of the examination (this year) gave virtually the same results.

It would, however, require several such tests, taken during the next four or five years, in many different institutions, to procure a fair basis for estimating the exact effect of substituting, during the last ten years, a little Latin and English for the old-fashioned classical training. If the Dartmouth statistics, published in your issue of February 16, proving that men with Greek training have furnished 54 per cent. of the successful scientific students, as opposed to only 20 per cent. from the scientific section—if these figures be added to the appalling indications from the Amherst examinations, then it would seem impossible that the Board of Education in New York city should attempt to economize by eliminating the Greek departments of the public schools. The abolishing of Greek generally in the public high schools will mean that only the sons of wealthy men who can attend the best private institutions are to enjoy the culture of true classical studies. It will mean that poor men's sons, who have hitherto furnished far more than 50 per cent. of its successful men to the country, must now be entirely excluded from the disciplined efficiency as well as the culture that can come only from the study of the humanities, especially from the study of Greek.

HERBERT F. HAMILTON.

Amherst College, February 22.

A PARALLEL.

To the Editor of The Nation:

Sir: I wish to call attention to a rather curious example of plagiarism (or, as some may prefer to call it, "transmutation of base metal into fine gold"), which appears in a book, entitled "The Manor Houses of England," by P. H. Ditchfield, M.A., F.S.A., published by B. T. Batsford, London (1910). The subject dealt with in this book had always been extremely interesting to me, and several years ago, after having paid a visit to England for the purpose of making personal observations and adding to the data which I had already collected, I wrote to the same publishing house which has recently brought out Mr. Ditchfield's book in this country, stating that I was engaged in preparing a series of articles on English manor houses and gardens, and inquiring as to the probability of such a series, or a book on this subject, being considered favorably for publication. I received a discouraging reply, and, thinking that it would be inadvisable to spend a year or two in the preparation of a book that would probably never be published, acting upon a suggestion made by the editor of *House and Garden*, I condensed some of my material into a short article, entitled "English Manor Houses of the Early Renaissance," which, after a lapse of about two years and a half, I had the pleasure of seeing appear in the issue of the aforesaid periodical for June, 1908.

When a few days ago I opened Mr. Ditchfield's attractive new book, I was struck with a feeling that in the very first sentence there was something strangely familiar. This feeling increased so much after turning the page that I hunted up the number of *House and Garden* which contains my old article. Imagine my astonishment when I found that Mr. Ditchfield (in the introductory chapter) had used almost word for word a portion of my little essay. A specimen of the passages referred to is given below in parallel columns:

HOUSE AND GARDEN ARTICLE.	MR. DITCHFIELD'S BOOK.
"The greatest advantages men have by riches are, to give, to build, to plant, and to make pleasant scenes." So wrote Sir William Temple, the cultured diplomatist, philosopher, and garden lover. . . .	England is remarkable for the number and beauty of the old country houses, set amid pleasant scenes. . . . The builders of these houses were animated by that same spirit which moved Sir William Temple, cultured diplomatist, philosopher, and garden lover, to write: "The greatest advantages men have by riches are, to give, to build, to plant, and to make pleasant scenes."
And from the number of delightful old country houses, set amid pleasant scenes, to be found in England today, we may infer that many other Englishmen, long before Sir William's time, held, in part at least, the same opinion as to the advantages of wealth.	And certainly they showed by their buildings that they were men of taste and refinement, very different from Macaulay's unflattering picture of the old English country squire who is represented as an ignorant boor.
Macaulay gives a very unflattering picture, indeed, of the old English country squire, but in his endeavor to make out his case against those who cried up the good old times he must have been drawn into exaggeration or he was totally unappreciative of the artistic merits of the old country seats. Is it possible that men so ignorant and crude could have built houses bearing evidence of such good taste? . . .	
It is not, as a rule, in the greatest mansions, the vast piles erected by the great nobles of the court, that we find such artistic qualities, but most often in the smaller manor houses of the baronets and squires. . . .	It is not in the greatest mansions, the vast piles erected by the great nobles of the court, enriched by the plunder of the monasteries, that we find such artistic perfections, but most often in the smaller manor houses of the knights and squires. . . .

Considering the fact that elsewhere in the book Mr. Ditchfield makes numerous quotations from various authors and citations of authorities, to all of whom he apparently gives full credit, is not the writer of this letter excusable in feeling somewhat aggrieved at not receiving any acknowledgment whatever?

B. C. FLOURNOY.

Washington, D. C., March 2.

FIRST RAISING OF THE STARS AND STRIPES.

To the Editor of The Nation:

Sir: In various histories of the American Revolution I have never noted any specific date or place where the Stars and Stripes were first officially raised over the Continental Army Headquarters.

We know the adoption of the flag by the Continental Congress was at Philadelphia, June 14, 1777, with orders that it be promulgated forthwith to the Army Headquarters. Now, the Army Headquarters were at Bound Brook, N. J., during the month of June and part of July, 1777. It seems reasonable, therefore, to suppose that the Stars and Stripes were first officially raised on Middlebrook Heights, near Bound Brook, not more than two days after June 14, allowing so much time for the courier to deliver the dispatches from Philadelphia, about sixty miles away. Histories clearly state that the flag was carried for the first time in the battle of Brandywine.

I understand that some twenty years ago an organization at Bound Brook, called the Washington Camp Ground Association, acquired part of the mountainside of Middlebrook Heights, where Washington encamped for two winters, and has ever since observed the Fourth of July there with patriotic exercises, on the presumption that on this spot the Stars and Stripes were first officially floated over the Continental Army. I should be interested to know whether there is any reason to dispute the claims of the society.

Literature

BOOKS ON BALKAN LANDS.

The Servian People: Their Past Glory and Their Destiny. By Prince Lazarovich-Hrebelianovich, with the collaboration of Princess Lazarovich-Hrebelianovich (Eleanor Calhoun). Vols. I and II. New York: Charles Scribner's Sons. $5 net.

The Lands of the Tamed Turk, or the Balkan States of To-day. By Blair Jaekel. Boston: L. C. Page & Co. $2.50.

Through Savage Europe: Being the Narrative of a Journey (Undertaken as Special Correspondent of the *Westminster Gazette*) Throughout the Balkan States and European Russia. By Harry de Windt, F.R.G.S. Philadelphia: J. B. Lippincott Co. $1.50 net.

There is no serious historico-ethnographic work on Servia in the English language, a version of Ranke's masterly "History of Servia and the Servian Revolution" alone excepted. Kanitz's monumental "Serbien" has remained untranslated, and in the last twenty-five years Servia has been treated only in chapters, as one of the Balkan States, in such collective works as Minchin's "The Growth of Freedom in the Balkan Peninsula" and—by far the most au-

thoritative of all—Villari's "Balkan Question." Mijatovich's "Royal Tragedy" and Herbert Vivian's "The Servian Tragedy" merely seized the sensation of the hour.

We have now before us two stately volumes on "The Servian People," by one in some respects unusually well qualified to speak for his countrymen. Prince Lazarovich-Hrebelianovich conveys, from personal knowledge and the study of excellent sources, mainly Slavic, much valuable information concerning the physical, mental, and moral characteristics of the Servian race and the geographical features of all Serb territories—the Kingdom of Servia proper, Montenegro and the "Servian lands under foreign domination" (Bosnia, Herzegovina, Dalmatia, Croatia-Slavonia, the Banat, and Old Servia, *i. e.*, the vilayet of Kossovo, with the Sandjak of Novi-Bazar and parts of the vilayet of Monastir and Saloniki). The author brings to the execution of his task unbounded admiration for the valor of the Serb in war and for his homely virtues in peace, qualities to which other than native writers have borne abundant testimony. In picturesque, even if not always idiomatic, language, Prince Lazarovich-Hrebelianovich extols all that is most attractive in the character of the Serb: "his wit and love of merriment, of song and dance, and keen practical proverbs, his pride and *grand seigneurism*," eulogizing likewise, in the public life of the nation, the workings of its democratic institutions, established many centuries ago, such as trial by jury and "popular participation by discussion in all decisions affecting the general welfare of the Serb group, tribe, clan, principality, state, or empire." He justly lays stress on the beneficent workings of the communal Zadruga, which exacts from all equal effort and shelters every member from want. Servia has been well termed "the poor man's paradise," and even the "Statesman's Year-Book" speaks only of "a few poor families" in the kingdom. Economists, however, may question whether the patriarchal system of the Zadruga is favorable to the nation's highest industrial development.

The martial spirit of the race, according to our author, awoke with the very dawn of history. Whereas Ranke hesitated to unravel the web of tradition which shrouds the first appearance of the Serb on historic ground, he confidently goes back to Homer to show that the ancestors of his race "brought their troops to defend Troy." His entire second volume is devoted to the minute and often tedious recital of the endless struggles of the nation against the Byzantine Empire and the relentless Ottoman yoke. The history of the last hundred years, that is to say, the period beginning with the war of liberation under the leadership of Karageorge, in 1804, receives comparatively scant treatment. In dealing with modern Servia, the author is willing to admit that, even if the people can do no wrong, the king can; though his criticism of Milan and Alexander is founded maiuly on what he deems their abject subserviency to Austria, and not on their private vices and public incapacity. "So long as the Obrenovich dynasty ruled in Servia, that is, during the reigns of Milan and his son Alexander, the Servian King had to obey the orders privately conveyed to him from the Austrian Emperor by the mouth of the Austrian military attaché in Belgrade." Indeed, hatred of the Hapsburgs pervades the entire work. There is not a redeeming feature in the picture of Austrian rule over Serb subjects. In Bosnia and Herzegovina (where the constructive work of Von Kállay called forth the admiration of all Europe) Lazarovich finds only an "elaborate and complete police system, penetrating every department of life, public and private, such as is unknown in any other country," and, moreover, "a great deal of starvation"; while in Dalmatia, since it became a crownland of Austria, in 1814, "general traffic has declined and shrivelled," and her wonderful historic towns are "more or less dead." Nor do, in the account here given, the Serb provinces of Hungary fare better under Magyar rule. Croatia has a population "practically starving," and in the Banat (whose southern part, the former Servian Voyvodina, is very largely inhabited by Serbs) the "small Magyar minority" is said to exercise the most ruthless tyranny over the non-Magyar electors at the polls. "Many unsubmissive non-Magyars are shot down, the victims on election days often numbering some hundreds of dead and wounded in every county."

While, in describing political conditions, the author is led astray by excess of patriotic fervor, he is a safe and pleasant guide through the villages and mountain ranges of his native country. The elaborate ceremonies of the "Slava"—the celebration of the family saint—which dates back to pre-Christian ancestor worship; engagement and marriage festivities and burial rites; the curious invocation of the "Dodola," the mystic demigoddess, personified by a gypsy girl, in whose keeping are the waters of springs and streams; the solemnities attending the starting of fire for the family hearth—part of the eternal holy flame; the observances of Christmas and Easter, in which religious rejoicing has more than once kindled warlike ardor; the patriarchal relations between parents and children; the sacredness of the ties of kinship—all this finds in Prince Lazarovich a sympathetic and substantially accurate interpreter. In speaking of the charm of the old Servian ballads, he is, however, misled into saying that Goethe "made translations from them into Western tongues, and he ranked them with the Iliad and Odyssey." Goethe translated into German, as a very young man, from a French version, a single poem, the famous "Klaggesang der edeln Frauen des Asan Aga," and late in life he was much attracted by a German translation of Karajitch's collection of Serb folk-lore, but he was unacquainted with any Slavic language, and he did not, greatly as he admired these ballads, express himself concerning them in the way imputed to him. Kanitz, however, in a striking passage, speaks of their magic charm, "which seems to conjure up the age of the Iliad and Odyssey."

The general accuracy of Lazarovich's text in the transliteration of Serb names is a commendable feature of the work, though there is inconsistency as to the end syllable *vič*, which is rendered indifferently as "vich" and "vitch." The transliteration of the name of the Polish poet Mickiewicz into "Mitskiyevich," though phonetically correct, is an unwarranted innovation. Among minor slips may be mentioned "Chancellor" Bach (the author of the Concordat of 1855 was merely cabinet minister), and "Archbishop" Strossmayer (the doughty champion of Croatian rights was only a bishop). A more serious blemish is the indiscriminate inclusion, among "men of Serb stock," of foreign celebrities like Schiavone, Carpaccio, Kossuth, Deák, aud "Petoffyi" (*sic*). The story of the "Servian" Count Zrinyi, who lives in Magyar history as the heroic defender of Sziget against Turkey, in the sixteenth century, is related merely as an incident of the "absolute heroism" of the Serb in the wars of liberation.

The author, in the very title of the book, lays stress on the "past glory" of the Servian people, and in dealing with the modern history of his countrymen he makes it sufficiently clear that his sympathies are neither with the Karageorgevitches nor with the Obrenovitches, who have for a hundred years guided the destinies of Servia—subject to assassination and deposition. His heart is in the days of the glorious fourteenth century, with Knez Lazar, generally referred to in these volumes as "Tsar Lazar Hrebelianovich." According to the best authorities, the house of the Lazarevitches (as they are commonly called) became extinct with Lazar's son, Stephen, who died childless, in 1427. The name Lazarevitch recurs, however, in the subsequent history of Servia (as in the rising of Karageorge), and while the author himself speaks of a mere "tradition" of a son-in-law of Czar Lazar, he evidently believes in the unbroken continuity of the family title down to the present time. He refers to a member of the Lazarovich-Hrebelianovich family as residing, in 1774, in Prussian Silesia, "the birthplace of the author's great-grandfather." Much to the

reader's surprise, the scion of this princely family (albeit the "Almanach de Gotha" recognizes no Servian aristocracy) appears in an entirely new rôle in an appendix to the second volume, where he pleads at length for the construction of a Serbo-Turkish waterway, based on "tables of estimates as furnished to Prince Lazarovich-Hrebelianovich for the American Engineering Company," at a total cost of $65,000,000. But this portion of the work must be left to professional experts.

Blair Jaekel's "The Land of the Tamed Turk" and Harry de Windt's "Through Savage Europe" have much in common—the journalistic origin, the hurried flitting from place to place, the lively descriptions of scenery, the abundant illustrations (those of "Savage Europe," in particular, being remarkably varied and life-like), and, it must be said, their frequent lack of accuracy in the rendering of Serb, Bulgarian, and other proper nouns. Mr. de Windt's volume is somewhat more comprehensive in scope, as he adds a chapter on "The Red Flag in Russia," whose grewsome details certainly fit better into the title of the book than do his glowing accounts of Bulgaria as "a land of milk and honey," and of the society of Belgrade as one where "the Servian girl of French education is generally better read and far more accomplished than her English prototype." Occasionally, the author's exuberant fancy leads him into strange metaphors, as when he asserts, of the capital of Bulgaria, that "no mushroom city in Western America ever sprang so quickly into a prosperous being from the ashes of filth and a corrupt administration." Both he and the writer of "The Land of the Tamed Turk" devote an inordinate amount of space to the murder of Alexander and Draga. Mr. de Windt claims to be "in a position to give the reader probably the first absolutely authentic account of the assassination of the late King and Queen of Servia which has ever been published in England" (his book seems to have been written three years after that event); but there is not much to choose between some of his authorities—the French palmist and the London crystal gazer—and Mr. Jaekel's three persons of "cabalistic power" to whom, in his own lurid story, he is "compelled to give credence."

CURRENT FICTION.

The New Machiavelli. By H. G. Wells. New York: Duffield & Co.

It is odd that Mr. Wells, radical and quasi-socialist that he is, should not have courage to depart from the lumbering British usage of dividing his novel into four or five "Books," each of which has to be painfully subdivided into the unit-group of chapters. Four books and five hundred unpadded pages make up this latest output of Mr. Wells's plant. Apparently, we have no single American writer who can come near paralleling the annual product (in pages) of Mr. Wells, or Mr. Phillpotts, or Mr. Bennett, or Mr. Benson, or Mr. Chesterton, or Mr. Lucas. Perhaps, we shall clear matters up to the best advantage, and with the greatest expedition, by stating that Remington, the hero and interlocutor of this narrative, is a male Ann Veronica—or rather an Ann Veronica dressed in its proper clothes, and tagged with its proper masculine label. Hardly since Montaigne—or Rousseau—has there sounded a voice so frank in confession of the fact of sexual experience; though here, to be sure, the mask of fiction is at the writer's service.

The "new Machiavelli" is son of "a lank-limbed man in easy shabby tweed clothes, and with his hands in his trouser pockets, . . . a science teacher." Remington senior, it appears, knows little—or *can* little—of science. He lectures acceptably, being a genial soul, but real experiment is avoided. "Science is the organized conquest of Nature," comments the son, "and I can quite understand that ancient libertine refusing to coöperate in her own undoing." Remington senior preferred what he calls "illustrative" experiment. Real experiments he did not do, "if he could possibly help it, because, in the first place, they used up time and gas for the Bunsen burner and good material in a ruinous fashion, and, in the second, they were, in his rather careless and sketchy hands, apt to endanger the apparatus of the Institute and even the lives of the students. Then, thirdly, real experiments involved washing up." The poor gentleman dies of too much suburban property (an estate too real), and Remington junior is left to pursue his way, not less disastrously. He becomes a university man, a politician, a publicist. Contemporaneously, he makes his way as a bachelor, sexually initiated somewhat later than the usual age, as a childless married man, and as a lover and father. He has the advantage of Ann Veronica—a bond of sympathy with Mr. Polly—in being undisguisedly a man. The book is disfigured only by passages of didacticism and of comment upon current English politics which but mildly concern the American reader.

Robinetta. By Kate Douglas Wiggin, Mary Findlater, Jane Findlater, Allan McAulay. Boston: Houghton Mifflin Co.

Whether too many cooks have spoiled the broth, or the hand of the chief cook has lost its cunning, this is but a pale and savorless infusion. Time was when a considerable clientele looked to Mrs. Wiggin for a literary fare which, without pretending to nutrition, was at least spicy and palatable. She had, no doubt, her lapses. The "Diary of a Goose Girl" came between "A Cathedral Courtship" and "Rebecca of Sunnybrook Farm." Her liveliness and bubbling humor have been fated to sink on occasion into mere jauntiness and pertness, and even to verge upon that coarseness which so strangely accompanies the play of feminine humor when it becomes self-conscious. "Robinetta" is more than a lapse—fairly a *débâcle*. It is as if Mrs. Wiggin and her three friends had united in a desperate attempt to imitate Mrs. Wiggin. As is common with imitations, the faults of the model are exaggerated, and its merit but faintly suggested. The old material is used. Robinetta is an American girl—a widow, as it chances; but that is mere piquancy—adventuring in England. The frontispiece represents her as about thirteen, but the text admits her to be twenty-two. Her mother was an Englishwoman, and Robinetta, a relict comfortably provided for, journeys to England to look up her relatives and her mother's old nurse. The people at Stoke Revel Manor are all that tradition demands—a dowager aunt, in possession; her spinsterly, not to say cattish, companion; a schoolboy; and the omnipresent British servant. The dowager and the spinster do what they can to make things disagreeable for the young guest. Robinetta, for her part, is of the breezy, voluble, flirtatious, smart, and "smarty" type of female American, though it is clear that her author (or authors) would not apply all of these adjectives to her. They think her very charming (of course she is distractingly pretty), and they have no sympathy whatever with the dowager. Their view of her is fortunately shared not only by the schoolboy midshipman, but by the visiting young man, whose rôle need hardly be specified. He is somewhat languidly in the law, but is understood to be in need of nothing but inspiration. Of course, the midshipman falls absurdly in love with his cousin, and further serves as obstacle in the path of the true lovers, which might otherwise be all too smooth. There is small excuse for stretching out the mild idyllic incident to the prescribed length of the novel of commerce.

Martin Hyde, the Duke's Messenger. By John Masefield. Boston: Little, Brown & Co.

More than once of late Monmouth's fiasco has been made the theme of the romancer. Here it represents rather the setting or occasion for the action, than the substance thereof. The tale is pretty frankly a tale of adventure; and the historical element is not permitted to weigh upon the reader's consciousness. This is as it should be. The trouble with our historical fiction—the most serious trouble, at least—is that it takes itself too seriously as history. We see too clearly the author's preoccupation

with his period or his catastrophe. His human figures are mere illustrative puppets. Now it is true that Scott was deeply interested in the historical scene of his romance, but always as a scene, always with a human story in the foreground, demanding our chief interest. We do not mean to compare Mr. Masefield with his great original. His touch upon the historical background is sketchy and even jaunty in the extreme. But we do feel that, partly on account of his nonchalance itself, he gets closer to the atmosphere of the duke's futile adventure than various chroniclers who have attempted the story in a more scrupulous and even prayerful spirit. Young Martin Hyde is a sufficiently preposterous little person, and his alleged doings are neither more nor less credible than the ordinary achievements of the romantic hero. The tale contains also the lovely adventuress (who is the heroine) and the villanous mariner without whom the recipe would be incomplete.

---

813. By Maurice Leblanc. Translated by Alexander Teixeira de Mattos. New York: Doubleday, Page & Co.

The preceding volume of Arsène Lupin's miraculous adventures in crime had a good deal to do with such antiquated royalties as Charlemagne and Louis XI and Napoleon. The present record audaciously (and we must say, with ill taste) brings in the living Emperor of Germany, who visits Lupin in his cell in a Paris jail for the purpose of getting from him letters of Bismarck and Frederick, which concern Alsace and Lorraine. The mystery of the book is remarkably well sustained, and, for one who is not bored by Lupin's superhuman exemption from accident and human weakness, the plot moves to a thoroughly dramatic climax.

AULARD'S REVOLUTION.

The French Revolution: A Political History, 1789-1804. By A. Aulard. Translated with a preface, notes, and historical summary by Bernard Miall. Four volumes. New York: Charles Scribner's Sons. $8.

The appearance of a translation of Professor Aulard's "French Revolution" must naturally be an event of some importance to that body of readers interested in the Revolution, but not conversant with French. Ten years ago, the author published the first edition of this history, which, in a sense, sums up the greater part of a lifetime of work devoted almost entirely to the one subject. The present translation is made from the third French edition, which has, of course, had the benefit of criticism and revision, and may, therefore, be regarded as representing M. Aulard's views with entire adequacy. The publication of the speeches of the Revolutionary orators, the documentary history of the Jacobin Club, the Acts of the Committee of Public Safety, and of the documents "for the history of public spirit in Paris," his essay on Taine as an historian, with the editorship of the *Revue de la Révolution Française* since 1887, abundantly evidence his qualifications and the tendency of his mind. Indeed, the sub-title of the original edition of his book, "The Origins and Development of Democracy and the Republic," expresses far more precisely than the sub-title of the translation, "A Political History," what this book really is.

One may hope and expect that these volumes will be widely read and used, but it is too much to expect that many who go to them for what is commonly known as the history of the French Revolution will not be disappointed. For the author would be the first to admit that no adequate conception of every side of the Revolution can be gleaned from these pages. "I propose," he says, in his preface, "to show how the principles of the Declaration of Rights were, between 1789 and 1804, put into operation by the institutions of the time; or interpreted by speeches, by the press, by the policies of the various political parties, and by the manifestations of public opinion." "Military, financial, and diplomatic history I leave on one side. I do not wish to disguise the fact," he continues, "that this abstraction may seem dangerous, and I expose myself to the reproach of having falsified history by a process of mutilation. . . . No historical work is sufficient to itself or to the reader. This of mine presupposes and demands the reading of others." It is this last sentence quoted in the translator's preface which becomes at once the key and the text of the present volumes. "To increase the interest for those who have not the leisure or the inclination to read other histories, and have not a knowledge or memory of the period sufficient to dispense with such reading," Mr. Miall has "prefaced the author's text with a brief sketch of the events leading up to the Revolution, a few remarks on the causes and nature of the Revolution, and a chronological summary of the chief events of the period, with explanatory notes and brief biographical sketches of the principal figures of the time." In short, apart from the notes, which are numerous and often very long, sixty pages of the first volume and more than a hundred in all are taken up with this attempt to supplement Aulard's text with sufficient material to make it intelligible to the ordinary reader.

This, with the large type, goes to explain how Aulard's original volume has grown to four at the hands of publisher and translator. Even so there is no bibliography save such as is contained in the notes, and the index leaves much to be desired. It contains, to take only a few instances, no references to Assembly, National, Constituent, or Legislative, neither Directory nor Consulate. These, indeed, are found in the Supplementary Index. But neither there nor elsewhere—save in the Chronological Summary—are found references to even the principal battles of the period. This, no doubt, in some measure grows out of the character of the work itself. Of the flight of the King, Aulard records—"it was on the night of June 20th that the King fled in disguise with his family." And, although, he says, "it was the victory of Valmy and the retreat of the Prussians that converted France so swiftly" to a republic, no further notice nor description of that event appears. It is thus evident that the attempt of an editor and translator to transmute an essentially scholarly, philosophical, even psychological monograph on the development of democratic ideas and practice, innocent of all pretence of narrating many of the most important phases of that great movement, into a popular history for the general reader, is fraught with great if not insuperable difficulties. It may be doubted whether it was quite worth while. Aulard's work, in itself so valuable, despite its limitations, is, after all, not wholly adapted throughout to the uses of the ordinary reader. It is questionable whether it can be made so by any amount of machinery or whether it ought to be. The present work will be useful, but not for its introduction, notes, and chronological summary. It will be for the translating, not the editing. As to the English version, one may say at once that it is clear and generally satisfactory. The frequent recurrence of the historic present will doubtless prove a source of irritation to some and there are occasional phrases that do not sound quite idiomatic.

Yet, with all this, there is no question that Aulard, in an English dress, is a welcome addition to our Revolutionary literature. His work is, indeed, a monograph. It omits much essential even to its own argument. It confines itself too closely to France, in particular to the speech and actions of the Assembly and public opinion. It leans, perhaps, a little toward the Jacobins, and stresses somewhat the Commune of Paris. Yet, when all is said, we find, as the conflict deepens and centres itself in Paris and the Assembly, not, indeed, a full account of the Terror, but an evaluation of the men and forces which went to make up the struggle, so clear, so vigorous, as to atone in no small degree for that lack of narrative which perplexes us elsewhere. There is enough fire in the account of Robespierre's fall and death even for the dramatic historian, and, in the sections on the *coup d'état* of the 18th Brumaire, the narrative causes one the more regret

that the author so deliberately cut himself off from the equally important movements and situations outside the Assembly. These the translator has preserved in all the vigor of the original, and it is certain that the reader to whom this translation is addressed, if he once comes clear of the machinery and monographic political philosophy of the earlier part, will not willingly lay the volumes aside as the narrative approaches the crises of Republicanism. Then, if not earlier, the book will be popular enough.

Cagliostro: The Splendor and Misery of a Master of Magic. By W. R. H. Trowbridge. New York: E. P. Dutton & Co. $3.50 net.

Mr. Trowbridge admits in his preface that he was drawn to the subject of the present memoir by the mystery and magic attending the career of an arch-impostor; his intention was, apparently, to produce another volume of piquant anecdotes similar to his "Seven Splendid Sinners" (which, as a matter of fact, is not so wicked as its title promises). But on looking into the various books and articles on Cagliostro, he found them so full of errors that he determined to produce a serious biography. The "arch-impostor" disappears under what bears a little the hue of "whitewash," although Mr. Trowbridge indignantly repudiates the charge.

The subject was well worth investigating, and, whether we agree with Mr. Trowbridge or not in his conclusions, we should be grateful to him for a frank presentation of the material. And on certain points he has made a strong case. He is unquestionably right in emphasizing the tainted nature of some of the sources from which the popular notion of Cagliostro has sprung. His argument against the identification of Cagliostro with the wretched Giuseppe Balsamo is fairly convincing. Further, his rejection of the traditional view of Cagliostro as a conscious hypocrite and scoundrel is, we think, based on a sound conception of human nature. But beyond this we cannot follow Mr. Trowbridge. There is a large field between a "sordid impostor," which Cagliostro may not have been, and the admirable character Mr. Trowbridge would have him to be. It seems a bit credulous to lend a willing ear, as does Mr. Trowbridge, to Cagliostro's wild stories of adventure in Mecca and Medina. Nor do we quite understand Mr. Trowbridge's repeated encomiums of Cagliostro for not taking money for specific acts of healing. He was able, until the ruin that followed the Diamond Necklace affair, to live in splendid style, spending, it was reputed, as much as 100,000 livres a year in Paris. This money came to him largely from the lodges of Egyptian Masonry, which he established all over Europe, and which regarded him as a great *illuminé*. "The principal resource I have to boast of," he once testified in court, "is that as soon as I set foot in any country I find there a banker who supplies me with everything I want." These abundant resources depended on his character for mystical illumination and superhuman virtue, which was fostered by his free-handed habit of curing the sick, by apparently miraculous means, without accepting compensation. It is perfectly footless to say, as Mr. Trowbridge does in Italics: "There is not a single authenticated instance in which he derived personal profit by imposture," when he was drawing a large and constant revenue from systematically duping the public. This is not to imply that he deliberately calculated such an effect in the manner of a conscious hypocrite. It means rather that he was himself largely a victim of the great wave of charlatanry that swept over Europe in the last half of the eighteenth century. It is probable that in some dark way he actually believed in the hocus-pocus of his Egyptian lodges; no doubt, too, he regarded himself as a true model of the quatrain inscribed on the prints of him by Bartolozzi that were scattered broadcast.

De l'ami des humains reconnaissez les traits;
Tous ses jours sont marqués par de nouveaux bienfaits,
Il prolonge la vie, il secourt l'indigence;
Le plaisir d'être utile est seul sa récompense.

The very source of this noxious mingling of crass superstition and mystical spirituality, of personal profit and exalted humanitarianism, was just the frame of mind which looked upon any analysis of motives as derogatory to the higher life; to question enthusiasm—"enthusymusy," as Byron called it—was to deny inspiration and fall back into the flat levels of rationalism. The outburst of the rosicruclans, *illuminés*, friends of mankind, etc., especially in Germany, is to any sane mind one of the most repulsive chapters of history; and Cagliostro, after all possible excuses are made, was one of the most repulsive of these practitioners of profitable virtue.

The best parts of Mr. Trowbrldge's book are those which tell of Cagliostro's life with the *illuminés* of Mittau, and which in a more general way describe the outbreak of superstition throughout Europe. He has added nothing new in this field, but he has treated in a popular way a subject of which little is popularly known. Indeed, many scholars might be led to modify their views of the Continental European literature of that period if they were more familiar with this aspect of its background. Mr. Trowbridge's half-admiration for Cagliostro we can in no wise share, but his book is interesting, well documented, and provides its own antidote for what seems to us false judgment.

The Collected Works of Ambrose Bierce. New York: The Neale Publishing Co.

Four volumes have now appeared of this sumptuous publication. The first volume contains essays in social satire and some autobiographical sketches; the second and third consist of collections of short stories, and the fourth of verse. Mr. Bierce's low estimate of democracy and all its works, which has been conveyed to the public mainly through the newspapers, attained the dignity of book form when "The Shadow on the Dial" was published two years ago. (Reviewed in the *Nation* of September 30, 1909, with examples of the author's style). The present group of social and political essays reveals no new qualities. Mr. Bierce writes wittily and with a practised hand; his extravagance in paradox and his fury of disgust with human nature and existing institutions may be excused as almost necessary to a journalistic competition for general attention. But they do not go well between covers. One example of them would be ten times as effective as ten examples, and the lady who sold Tarquin the Sibylline books would have been a sounder literary adviser for Mr. Bierce than any other subscription agent known to the trade.

The volumes of tales, entitled respectively "In the Midst of Life" and "Can Such Things Be?" include the stories published under the former title in 1898, with many additions. Several of those that deal with the civil war have almost classical qualities. They are brief, restrained, uncompromising. In their bald use of the hideous phenomena of war they inevitably suggest a comparison with Kipling, and they can stand the comparison, for Mr. Bierce has the advantage of having been himself a soldier. Not only does he know intimately what he is talking about but the profound experience of war has given him an insight into its psychology which no non-combatant—not even Tolstoy—can attain. "An Occurrence at Owl Creek Bridge" is a masterpiece of horror.

The ghost-stories which make up the bulk of the two volumes are not so remarkable as the war-tales. If there is any literary ingredient which needs to be sparingly used it is the *macabre*. Mr. Bierce's first deserted house produces something of a thrill, but there are a dozen deserted houses. And in any house he deals with, deserted or not, the sheeted corpse upon the table, its features sharply outlined beneath the veil, is so invariable a phenomenon that the reader feels quite cosey and at home with it, and indeed looks about for it on entering. The interest of the tales is intellectual. The reader feels that the

writer is not really afraid of ghosts himself. In this field Mr. Bierce has evoked a mightier rival than Kipling, and he cannot successfully compete with Poe.

Of the verse contained in the fourth volume it is perhaps enough to say that it is probably not immortal.

Notes

The scene of "An Old Maid's Vengeance," the new novel by Frances Powell, which is to come early this month from the Scribner press, is an old villa in the Riviera.

Moffat, Yard & Co. announce for early publication: T. Chalmers Potter's "Queenie, the Autobiography of an Italian Queen Bee"; novels by Harry Irvine Greene and Beatrice Grimshaw, entitled respectively, "Barbara of the Snows" and "When the Red Gods Call"; an enlarged edition of William Winter's "Gray Days and Gold," and a mystery story, "The Substitute Prisoner," by Max Marcin.

Houghton Mifflin Co. will issue March 11: "The End of a Song," by Jeannette Marks; "Yosemite Trails," by J. Smeaton Chase; "Wells Brothers, the Young Cattle Kings," by Andy Adams; "The Face of the Fields," by Dallas Lore Sharp; "A Study of Greatness in Men," by J. N. Larned; "A Roman Wit," by Paul Nixon, and "A Bibliography of the White Mountains," by Allen H. Bent.

Robert Hichens's new novel, "The Dweller on the Threshold," is brought out this week by the Bobbs-Merrill Co.

Henry Holt & Co. have been busy with a revised edition of John D. Champlin's "Young Folks' Cyclopædia of Persons and Places," which may be expected March 11.

"Such a Woman," by Owen and Leita Kildare, and "Priest and Layman," by Mrs. Ada Carter, are among the spring novels announced by Wessels & Bissell Co.

Doubleday, Page & Co. have in preparation Mrs. Harriet T. Comstock's new novel, "Joyce of the North Woods."

The Baker & Taylor Co. announces a new edition, with additional poems, of "In Praise of Gardens," edited by Temple Scott.

Spring announcements of the University of Chicago Press include: "The Elementary Course in English," by James Fleming Hosic; "Child Mind and Child Religion," by Edwin D. Starbuck; "The Theology of Schleiermacher," by George Cross; "The Hebrew Prophets, or Patriots and Leaders of Israel," by Georgia L. Chamberlin, which is a text-book for pupils of high-school age, and a pamphlet, "Sir Perceval," by Reginald H. Griffith.

Sir John Evans's Horn Books, with specimens from A. W. Tuer's collection, and others described by him in his "History of the Horn Book," will be sold at Sotheby's on the 17th.

Dr. A. W. Verrall has been appointed to the new professorship of English at Cambridge, England.

Buttressed, so to speak, between an Introduction by Earnest Hamlin Abbott and a concluding Historical Summary by Dr. Lyman Abbott, fourteen of Mr. Roosevelt's campaign speeches and editorials on "The New Nationalism" come from the press of the Outlook Company. It was a brave act thus to step in between the much maligned campaigner and any frontal or rear attack on his system, but it was scarcely generous in the Introducer to suggest that the New Nationalism is only another turn for the name New Federalism, which had already been given to the "national consciousness" by the *Outlook* as one of the "other leaders of public opinion." The book has value as a permanent record of Mr. Roosevelt's views.

Two new volumes of Everyman's Library (Dutton) have come to our table containing (1) Dostoïeffsky's "Crime and Punishment," translated by Frederick Whishaw, and (2) "Chronicles of the Pilgrim Fathers," being a modernized reprint of Morton's "New England's Memorial," and five other chronicles. The Introduction to the latter is by John Masefield, who also provides occasional notes.

The first volume of "The Correspondence of Jonathan Swift, D. D." (Macmillan) begins a work the interest of which for students of literature and readers will scarcely be exaggerated. Three years ago the task of editing the letters was undertaken by Cæsar Litton Falkiner, who was already known in this field for his contribution to the twelve-volume edition of Swift's "Prose Works" in Bohn's Library. The death of Mr. Falkiner within a year transferred the projected work to the hand of F. Elrington Ball. However the loss of the first editor may be regretted, it must be added that Mr. Ball's treatment of the material published in this first volume deserves high commendation. As in the great majority of the letters a facsimile reproduction is no longer possible, the editor has wisely modernized the spelling and style of printing throughout. The notes are sufficient and judicious. This first volume contains a few letters of value for understanding Swift's character, notably that to Miss Jane Waring, dated "Dublin, May 4, 1700." But for the most part it contains the correspondence between Swift and Archbishop King, which deals with Irish ecclesiastical matters of no great interest. The last letter included carries us down to December 20, 1712. We shall reserve fuller comment on this important publication until one or two more volumes have been added.

Of the several volumes of poetical works which have been issued recently by the Oxford University Press (Henry Frowde), that of Dryden should be mentioned first, if only because of its exterior; it is bound in felt, of a color which one might more readily have associated with a pseudo-romanticist—crushed raspberry—and which at any rate makes one loath to close the volume, once it is open; thin paper brings this great bulk of verse into surprisingly small compass. The introduction and notes are by John Sargeaunt, who has, like another recent editor of Dryden, George Noyes, made a complete collation of the original texts; together, they will help to remove forever some of those traditional textual errors from which Dryden's work, especially, has suffered. The poetical plays are not included. More cautious in binding than the Dryden volume is the deep colored leather employed in "The Poetical Works of Thomas Moore," edited by A. D. Godley. This edition purports to reproduce exactly that which appeared under Moore's supervision in 1841, save for the omission of the historical preface and such notes as are not strictly explanatory. Mr. Godley's introduction is spirited even while presenting nothing that is new. In addition to this form, the publishers have put forth a school edition. In double form, also—the one in the series known as Oxford Library of Prose and Poetry and the other for school purposes—is Shelley's "Prometheus Unbound, with Other Poems," which is based upon the edition published by Ollier, in 1820, with the manifest errors corrected; the school edition is provided with an introduction and notes by A. M. D. Hughes. To the Oxford Library of Prose and Poetry has likewise been added "Poems of Clough," including "Ambarvalia" and both versions of "The Bothie." A brief preface and a few footnotes have been prepared by H. S. Milford.

Twenty years ago it would have been difficult to recommend to an inquiring student a treatise of moderate compass on the religion of the Old Testament written from the point of view of modern scientific history. There are now a number of such manuals, and to the list may be added Arthur Galton's translation of Loisy's "Religion of Israel" (Putnam). The author, whose conflict with his ecclesiastical superiors and subsequent excommunication excited interest throughout Christendom, is now professor of the history of religions at the Collège de France. He writes on Hebrew religion purely as an historian, without apologetic interest or endeavor to reconcile his conclusions with adherence to the church. His first chapter is on The Sources, in which he does not differ widely from the general conclusions of the Wellhausen school. He does not agree with Winckler in the derivation of the Mosaic legends and the histories of the Judges and David from Babylonian myths. One of the most valuable portions of the volume is the exhibition of the relation of early Hebrew religion to other Semitic faiths, but it is in his treatment of the work of the prophets and the value of prophetism in the preservation of the religion of Israel that Loisy is most original and suggestive. Here the same feeling comes out as to the necessity of ritual and social institutions, in order to the perpetuation of faith, that was manifest in his criticism of Harnack's "Essence of Christianity." He says, "Religions, in history, are not theories, nor sentiment, nor mystical aspirations, but the traditions of social life guaranteed by the consecration of a ritual." He dissents, therefore, from the view that "the religion of the prophets was materialized, narrowed, and lowered by the Law." There may be truth in the view that the written law kept alive the faith of Israel, but this judgment may easily lead to lack of appreciation of the character and influence of the prophets. No one but a Puritan can really understand the great masters of Israel's faith. In his sketch of Hebrew religion as a whole, however, Loisy exhibits penetrating discernment, sanity of judgment, and not infrequently brilliancy of insight.

The third annual volume of "Writings on American History" (Macmillan), prepared by Grace G. Griffin, covers the pub-

lications of the year 1908, and conforms in all respects to the plan adopted for its predecessors. The cost of publication has thus far been met by a group of subscribing societies and individuals, but for the future the bibliography will appear as part of the annual Report of the American Historical Association, an arrangement that will guarantee its continuance. The usefulness of the work has been amply demonstrated.

The tenth volume of the "Index of Economic Material in Documents of the States of the United States" (Carnegie Institution of Washington), relates to Delaware, 1789-1904. Again, as in the case of the volume on Kentucky, the editor, Miss Hasse, has to record the regrettable fact that it has not been possible to collate a continuous file of the Journals of the Senate and the House of Representatives. The Senate journals for the years from 1789 to 1791, constituting eight sessions, are missing, and as very few copies of the early journals were printed, there is little hope that the lost numbers will be found. Miss Hasse's comment to the effect that Delaware is that one of the thirteen original States whose documents have received the least attention, recalls Professor Dawson's remark in his report on the public archives of Delaware, that "there is probably no State in the Union where one would find less material for writing its history than in Delaware, and there is certainly no one of the original thirteen in which so few records have been made, and where so little care has been taken of those that have been made." The scarcity of documentary material in Delaware is in part due to the carelessness of officials (part of the papers were used by the janitor of the State House to start fires), and in part to "the dishonesty of students and antiquarians from within and without the State, who have abused the confidence of the State officials."

The fifth volume of the Biographical Register of the Officers and Graduates of the United States Military Academy is a disappointment. The late Gen. George W. Cullum made two great bequests to his alma mater, the West Point Military Academy—the beautiful memorial hall, which means so much to the institution, and a fund sufficient to publish every ten years a supplement to his Register of Graduates, originally issued in 1868. The three volumes compiled by Gen. Cullum prior to his death form an invaluable reference work and one of the most useful biographical compilations extant. Moreover, it was brought together with scrupulous accuracy and scholarly thoroughness. The volume before us falls off deplorably from the standards of Gen. Cullum. Both in typography and paper the book is inferior. Its value is marred primarily by the fact that nearly two hundred graduates failed to make any response to the circulars for information. For this, the editor, Lieut. Charles Braden, is not to be blamed. The War Department itself has had so much trouble in getting officers to answer business communications that it has had to court-martial several within the last two years for this epistolary neglect. Lieut. Braden has had the same experience with disastrous results to the work before us, and, curiously enough, he has been greatly handicapped by the War Department—as stupid a piece of bureaucratic shortsightedness as has come to our notice. As he himself tells the story: "The editors of the previous editions were able to procure from the files of the War Department records not otherwise obtainable. The editor of this edition was denied this privilege, and is greatly disappointed with the results of his labors."

But much as we should like to acquit Lieut. Braden of all blame, we cannot do so. Marks of careless editing and inefficient proofreading are everywhere. Thus, there is no excuse whatever for the misprinting of names of living officers. For instance, Major Armand I. Lasseigne becomes Armand L. Lasseinge; again, Lorenzo P. Davison becomes Lorenso P. Davison, and similar instances could be cited indefinitely, as, for instance, on page 842, where it is gravely stated that Lieut. Kenneth B. Harmon is the son of Col. M. F. Harrison instead of Col. M. F. Harmon. Again, there is no sense of proportion in the editing, some of the officers having pages and others only a few lines, the former accounts being padded by such insignificant details as that the officer has had three days' leave or seven days' leave. Moreover, many of the notices could have been bettered by Lieut. Braden even if he had not heard from the officers in question. For instance, when, in many cases, the family history of officers is given, it is rather surprising to find no mention of the fact that Lieut. Ulysses S. Grant 3d is the son of Gen. Frederick D. Grant and the grandson of Gen. U. S. Grant. Similar facts in a good many cases were available from the Army Register or the monthly army record, but were not utilized. All this is so poor a return to make for Gen. Cullum's bequests as to appear almost an infidelity to that gallant officer and patriotic son of West Point. Before the next volume appears, in 1920, it is to be hoped that the then superintendent of West Point, in connection with an enlightened Secretary of War, will see to it that there is a return to the high standard of the earlier volumes, that they may be hereafter as in the past a great source of accurate information for historians, librarians, genealogists, and journalists, besides a memorial to the patriotism and self-sacrifice of the graduates of the Military Academy.

The Mexican government is commemorating last summer's centennial of its independence by issuing a series of volumes of "Documentos Historicos" of the revolutionary period. The editorial work has been done by D. Genaro Garcia, who has made this his chief occupation since his appointment as director of the National Museum of Archæology, History, and Anthropology, some three years ago. The books are printed at the Museum Press, and the typography, presswork, and admirable reproductions of portraits, manuscripts, paintings in colors, as well as the charming decorative head and tail-pieces, suggest that Mexico has little to learn from government printing offices elsewhere. The first two volumes of the series, which is planned to number eighteen in all, are devoted to the various apparently unconnected efforts to start outbreaks against the Spanish control, during the years 1807-1809. The scattered nature of the evidence which has been collected shows that the idea of independence was very much in people's minds, although most of them had the haziest notions as to what they really wanted to accomplish. The third and fourth volumes contain the history, so far as it has been possible to gather it together, of the periodical press of the revolutionary party. Sr. Garcia has made a most important contribution to our understanding of the way in which the leaders in the struggle against Spain gained and held the effective support of the body of the Mexican people by constantly supplying them with the arguments, of varying degrees of moderation, which justified the movement for independence. The volumes reproduce, in excellent facsimile, the surviving copies which Sr. Garcia has been able to find of these most ephemeral periodicals. Printed in the majority of cases wherever the patriot army was able to maintain its headquarters, with itinerant presses and workmen, on such paper as could be obtained by the fortunes of war, these issues of what can hardly be styled "newspapers" afford material for the study of a very significant aspect of the struggle for Mexican autonomy. Of the two other volumes of Sr. Garcia's series already issued, the fifth contains the story of the part played by the women who figured largely in the underlying negotiations, and occasionally in the open fighting as well, between the patriots and the Spanish officials. They were efficient counsellors, and often very militant, but a cursory examination of the documents relating to their activities raises a strong doubt whether they would have wished their record to be considered as a chapter in the struggle for suffrage. The sixth volume is devoted to the legal proceedings against those whom the officials regarded as the real fomenters of the outbreak of 1810.

In 1862 William de La Rive published his recollections of his kinsman, Cavour. They remain, after half a century, the best intimate sketches of the consummate statesman, whose great-niece, the Marchesa Adele Alfieri di Sostegno, has recently had an Italian version of them made for the centenary of Cavour. This volume possesses the unique merit of containing nearly a score of illustrations, among which are portraits of Cavour at different ages, of his parents and relatives, and views of Santena, the Cavour country-place near Turin. Most of these pictures are given for the first time, because the statesman's heirs have shrunk from this sort of modern publicity. The veteran Marquis Emilio Visconti Venosta, who married the elder of Cavour's great-nieces, furnishes a brief introduction to this interesting volume (Turin: Fratelli Bocca), which prints, also, three remarkable letters of Cavour in 1828, 1830, and 1831.

"The Island of Stone Money," by Dr. William Henry Furness 3d (Philadelphia: Lippincott), is an attractive account of the people of Uap, a small island in the little-known Caroline group. Though the German control, with its benign banishment of alcohol, appears to have effaced the old tribal divisions, the islanders retain many of their ancient customs. Their money consists of stone wheels, from one foot to twelve feet in diameter, made of fine limestone; the stealing of money is thus dif-

ficult. Well-built clubhouses, for men single and married, are council chambers and places of amusement. An apparent survival of polyandry exists in the custom of assigning one woman as consort to all the men of a clubhouse; such a woman is well cared for by the men (though ignored socially by the women), and not infrequently makes a good marriage. There are songs in a language now unintelligible, perhaps an old forgotten dialect. The religion shows the usual apparatus of ghosts and spirits (these last mostly maleficent), and some not well-defined gods; and magicians, of course, are influential and adroit. The physical type of the people (called Malayan by Furness) is good, and they are fairly good-natured and mildly industrious. Dr. Furness got some cosmogonic stories, but doubts whether they are old; in the form in which he heard them they are very crude, resembling in this respect what he learned of the Uap conceptions of the future life. Taboos for fishermen are enforced; there is no trace of totemism. The chief product of the island is cocoanuts. Copra (the sun-dried meat of ripe cocoanuts) is exported to Europe, where the oil is used in the manufacture of fine soaps.

Judge Francis Cabot Lowell of the United States Circuit Court, and a cousin of A. Lawrence Lowell, died suddenly on Monday at his home in Boston. His only other activities outside his profession were connected with Harvard College, as a fellow and member of the corporation. He was born in Boston in 1855; graduated from Harvard in 1876, and from the Harvard Law School in 1879. Before his elevation to the Federal bench, he found time to contribute to several magazines; he also wrote a book, "Joan of Arc."

Antonio Fogazzaro died in Venice early Tuesday morning, after an operation for cancer of the liver. He was born in Vicenza, March 25, 1842. Early in life, he made himself known to the public by the poem "Miranda," which was followed shortly by a volume of lyrics. Then came "Malombra," a romance; "Daniele Cortis," which pictured a hero humble before God, but rebellious toward mankind; "The Mystery of a Poet," a philosophical romance; "Piccolo Mondo Moderno"; his best known work, "Il Santo," "The Patriot," and "The Man of the World." Fogazzaro will be treated at some length in the *Nation* of next week.

Science

The Evolution of Man: A Popular Scientific Study. By Ernst Haeckel. Translated from the fifth (enlarged) edition by Joseph McCabe. Two volumes, pp. xxxiv+774; sixty genetic tables, thirty plates, and 463 figures in the text. New York: G. P. Putnam's Sons. $5 net.

Under the title "Anthropogenie," the original of this work appeared in 1874; the English translation of five years later was noticed in the *Nation* of December 18, 1879. In 1905 was published a translation of the revised and enlarged fifth edition, including, among other notable additions, "the remarkable effect of mixing human blood with that of other animals," the fossil "ape-man" of Java, and the gigantic gorilla from the Cameroons. The present edition (to give information that should have been supplied by the publishers) seems to be identical in text and illustrations, but the paper is thinner and the pages smaller and fewer (with corresponding reduction of price), and a translator's preface replaces the author's prefaces to the fourth and fifth editions. This last change is regrettable; the author's preface to the fourth edition closed with the significant declaration that "it is impossible for a man to have real self-knowledge unless he is acquainted with the story of his development," and that to the fifth edition frankly expressed the "fear that many errors may have been overlooked; that was inevitable in view of the intricacy of the subject and the defects of the craftsman."

Some mistakes there are, *e. g.*, the interruption of the gill-clefts in fig. 200, the naming of the brain-segments in fig. 339, A, and the designation of plate xxiii, L, as the brain of a "Bushman," whereas it is unmistakably copied from Tiedemann's figure of the brain of a Bush*woman*; there are some contradictions, *e. g.*, between fig. 254 and the statement on p. 216 that the spinal cord of amphioxus is a "thin" tube; some unwarranted assumptions, *e. g.*, that man is the "highest" animal (p. 280), that the brain is phylogenetically older than the spinal cord (p. 509), and that inflammation of that "worthless primeval heirloom," the appendix, is commonly due to foreign bodies (p. 660); there are serious omissions, *e. g.*, the sources of many figures, the Sirenia as probable exemplifications of retrograde evolution, and the pons and rectal pouch as distinctive of the mammals and selachians, respectively; there are faulty methods, *e. g.*, too frequent repetitions, the infrequent employment (outside the tables) of clearly demarcated categories, and the absence of a bibliography, for which the foot-note references do not compensate; there are even violations of good taste, *e. g.*, the polemic attitude, the allusion to the elder Agassiz (p. 75), and the ignoring of the contributions of Wilhelm His to human embryology and the development of the brain. But the critic should recognize the stupendous magnitude and difficulty of the task, allow for the intensity of the author's convictions and for his avowed position of advocate rather than judge, and keep in view the mountains of "ignorance and superstition—the worst enemies of the human race"—which he is striving to remove.

From surprisingly diverse sources Haeckel offers evidence that, as to structure and mode of development, man is allied in an ascending scale with all living things, with animals, with vertebrates, with mammals, and with the apes, so closely that, were it possible to eliminate prejudice, few thoughtful persons would hesitate to conclude that the human body originated like that of any monkey. But our author further maintains, as on p. 575, that "the human soul—a function of the brain—is only a more advanced ape-soul," that neither has any existence apart from the material body, and that the belief in immortality is an "untenable superstition." Whatever their belief, few will concede the logical necessity of these conclusions; some will even adduce the author's own high character, useful life, and brilliant achievements as indicating something more than this visible world. Certainly this work deserves to be read by all who seek to be well-informed; it is particularly commended to the clergy, notwithstanding the author's lack of religious belief and defiance of ecclesiastical authority.

The translation must have been a difficult task and is mainly satisfactory. There is a refreshing absence of the intrusive "Anlage," which besprinkles some publications as if their writers feared non-appreciation of the fact that they were "made in Germany." The translator must be held responsible for a few misprints. Since this edition is dated 1910, Gegenbaur and Kölliker should not be mentioned as if still living. The glossary is very inadequate; *chorion* is omitted and is not clearly described in the text; "eating cells" is a bald equivalent for phagocytes; instead of "the science of rudimentary organs," dysteleology is rather the doctrine of useless vestigial organs; in this, as in other cases, there should be references to the pages where the words are fully discussed. The index omits too many words for enumeration here, and often, as in the case of Huxley, the references are far too few.

Dr. John Warren Achorn is publishing with Moffat, Yard & Co. his "Nature's Help to Health."

Among the science books to be issued by the University of Chicago Press are: "Recent Developments in Agricultural Education," by Benjamin M. Davis; "Some Phases in the Development of the Subjective Point of View During the Post-Aristotelian Period," by Dagny G. Sunne, and "The Problem of Angle-Bisectors," by Richard P. Baker, the last three being pamphlets.

The forthcoming book by Professor Huebner of the University of Pennsylvania, on "Property Insurance," devotes twenty-three chapters to fire insurance, eight to marine insurance, and three to corporate suretyship, title insurance, and credit insurance. The book will be published by D. Appleton & Co., who also promise "Prevention of Infectious Diseases," by Dr. Alvah H. Doty, health officer of the port of New York, and "Principles of Industrial Management," by Prof. John C. Duncan of the University of Illinois.

Jacob Heinrich Van Hoff, who died in Berlin last week, aged eighty-nine, was professor of chemistry at the university of that city. In 1901 he received the Nobel prize of $40,000 for chemical research and in 1903 he delivered a course of lectures at the University of Chicago.

Dr. Walter Remsen Brinckerhoff, assistant professor of pathology at the Harvard Medical School, and an authority on leprosy, died of pneumonia just a week ago, in Cambridge, at thirty-six years. He was first director of the leprosy-investigating station of the United States Public Health and Marine Hospital Service, in Hawaii. He served from 1906 until 1910, then came to Harvard. He was made a fellow of the Rockefeller Institute for Medical Research in 1904. Last year Dr. Brinkerhoff and his associates, assisted by Dr. Clegg of the United States service in Manila, succeeded in isolating the leprosy germ and finding an artificial medium on which it would feed, and in paving the way for the eventual cure of leprosy by antitoxins.

Drama

THE NEW THEATRE AND A MORAL.

It is not at all necessary to accept at their face value all the various reports which have been and still are current concerning the future of the New Theatre. The exact determination of that matter, probably, is something that still lies upon the knees of the gods, or of the gentlemen who are financially interested in the enterprise. But there are certain facts which are patent to all intelligent observers and which carry with them an instructive moral. How much money the theatre has made or lost, whether it is to be devoted hereafter to drama, spectacle, opera, operetta, vaudeville, or ballet, does not signify. The great point is that it has failed notoriously and grievously to justify the pretensions with which it started, and that an enormous amount of money has been expended, with the very best of intentions, but to very little practical purpose. It is plain that the institution can no longer be conducted profitably—in any sense of the word—under its present policy.

It may be conceded at once that the directors have made good use, in some respects, of the extraordinary opportunities accorded them. They have produced some good plays—"Strife" and "The Thunderbolt" for example—exceedingly well; they have set a valuable example by their minute care with regard to the minor details of stage management; they have provided lavish and artistic decoration; they have produced plays of different types and times. Yet their failures have been far more frequent than their successes and they have fallen lamentably short of the proposed ideal of a representative theatre. It is only in the modern drama that they have displayed executive capacity. In Shakespearean tragedy, "Antony and Cleopatra," they achieved a spectacular fiasco. By flagrant miscasting, they robbed "Twelfth Night" of its romantic and poetic charm and "The Merry Wives of Windsor" of its robust merriment. "The School for Scandal" they dulled and spoiled by some fantastic and inscrutable principle of modernization. They first rejected "The Piper" and then imperilled the success of it by putting a woman to play the part of the essentially masculine hero. Many other artistic shortcomings might be proved against them, but it is only fair to remember that they were placed in an almost impossible position. Like the ancient Hebrews in Egypt, they were asked to make bricks without straw.

The simple truth is that the New Theatre was built upon the foundation of a stupendous fallacy, the notion that money can create brains and experience as well as supply material. Doubtless, talent—if existent—may be bought as readily as bricks; but if it does not exist, money cannot make it. The founders of the New Theatre seem to have thought that all they had to do was to construct a marble palace for the drama and endow it, and that all the rest would be easy. They imagined—in the face of warnings—that the ideal stock company of which they dreamed, a stock company capable of playing everything from high tragedy to farce at a moment's notice, could be created by a check. The melancholy fact is that up to the present moment they have made scarcely any real progress toward the establishment of such a company. They have been obliged, from the first, to engage outside players the moment they have attempted to interpret anything but modern drama. So far as the training and development of actors are concerned—in which the great potency and value of a stock company consist—they have improved but little upon the methods of the syndicate. They have offered a variety of entertainment, to be sure, but they have contributed little to the advancement of theatrical art.

If the story be true that the founders meditate the construction of a new and smaller theatre, more fitted for dramatic representations, their past experience ought to teach them many things. The first is that a stock company can be formed only by degrees, that it must be self-sufficient, that reinforcement from the outside is not only contrary to the principle of it, but actually fatal to the spirit which ought to animate it. Moreover, a stock company needs competent direction and instruction, that it may learn something about the arts of speech and gesture. Slovenliness of utterance and carriage may be appropriate enough to the slovenly and illiterate modern play, but are out of place in tragedy, romance, and high comedy. The moral of the New Theatre experience, so far as it extends, is that good will, liberality, and luxurious ideals are powerless to establish an artistic theatre without the aid of professional and technical experience, and that the logical course is to make sure of our company before taking thought about their permanent home. If the founders of the New Theatre be wise, they will first decide just what they wish to do; they will next find the most competent director to be had for love or money, and then invest him with absolute authority.

The Birthday Festival at the Shakespeare Memorial Theatre, Stratford, will be held from April 17 to May 6.

There will be an interesting opening at the Nazimova Theatre on the 13th instant, when Augustus Thomas's latest play, "As a Man Thinks," will be produced. Mr. Thomas long has occupied a leading position among American dramatists. His plays are apt to furnish not only strong dramatic and human interest, but matter for future reflection. This one is understood to deal with phases of contemporary business life. The principal character in it will be acted by that excellent comedian John Mason, with whom Walter Hale, Vincent Serrano, Chrystal Herne, Amelia Gardner, Charlotte Ives, William Sampson, and John Flood will be associated.

Yet another new play will be offered to public appreciation on the 13th instant. This is a piece entitled "The Confession," of which the central figure is said to be a priest, who, in trying circumstances, exhibits an unwavering fidelity to his trust. Theodore Roberts, Orrin Johnson, Ralph Delmore, and other well-known actors are to participate in the interpretation of the work. The name of the author and the purport of the story have not yet been announced, but the latter may be guessed.

Oscar Asche and Lily Brayton, who are now playing "The Merry Wives of Windsor" with much success in London, will soon appear in a new play, by Edward Knoblauch. This is to be a very elaborate production, the action of the drama taking place in the East.

J. E. Vedrenne and Dennis Eadie will open their joint managerial campaign in the London Royalty Theatre, which has just been completely renovated. Jerome K. Jerome's new play, with which they will begin operations, is in four acts, and is said to deal with a question of much present interest.

On March 20 H. B. Irving begins a provincial tour which he will end at Dublin, on May 6. Six days later he and his wife, Dorothea Baird, sail for Australia, to remain there for six months certainly, and possibly longer. The opening date has been fixed for June 24, either in Melbourne or Sydney. Which piece will be chosen for the occasion has not yet been definitely settled. Mr. Irving's repertory includes "The Bells," "The Lyons Mail," "Louis XI," "Hamlet," and "Faust," of which a special production is to be made. Mr. Irving appearing for the first time as Mephistopheles; also "Princess Clementina," "Jekyll and Hyde," and "Robert Macaire."

"Mr. Jarvis," an adaptation from a novel which has just been produced in Wyndham's Theatre, London, is spoken of disrespectfully by the London critics. It is a pseudo-historical piece, in which a supposed natural son of James II is made to impersonate the Chevalier de St. Georges, with a view to the betrayal of Bolingbroke and other Tories into the hands of the famous Duchess of Marlborough and her Whig allies. He carries out his part of the intrigue successfully, but falls in love with a fair Tory, and exposes the plot before it has had time to do mischief. H. V. Esmond, Gerald Du Maurier, Leon Quartermain, Henrietta Watson, and other good players were in the cast, but, apparently, could not overcome the inherent dulness of the play.

In "The Influence of Molière on Restoration Comedy" (Columbia University Press), Dr. D. H. Miles commendably avoids some of the dangers in this type of study: he does not struggle to maintain a fancifully original theory; he does not overestimate the influence of his author; and, best of all, he does not regard mere borrowing of materials as equivalent to genuine discipleship in method and purpose. His work is, however, defective in not indicating its relation to previous treatments of the subject. In general it agrees with the conclusions of A. W. Ward, Bennewitz, Charlanne, and Harvey-Jellie; in some particulars it differs from them; but the uninformed reader has no means of distinguishing what is old, undisputed, or new. It would, furthermore, have been well to show how this study complements others of a parallel or a more general character—for example, Miss Canfield's "Corneille and Racine in England," and M. Charlanne's "L'Influence française en Angleterre." The main thesis—that the influence of Molière's art was, on the whole, moderate, but, whenever felt, beneficial—is clearly and soundly established. Dr. Miles seems, however, a little too ready to assume that the comic method of Molière was in every case superior to that of the English masters. He holds the traditional opinion that the Restoration audiences were utterly corrupt, which may seem dubious to any one who remembers their admiration for the heroic drama. Despite such debatable judgments and the imperfections of method, the work deserves to be recognized as useful; for it analyzes and traces the influence of Molière more thoroughly than had been done before.

Music

Sketch of a New Esthetic of Music. By Ferruccio Busoni. New York: G. Schirmer.

The Basis of Musical Pleasure. By Albert Gehring. New York: G. P. Putnam's Sons.

How to Think Music. By Harriet Ayer Seymour. New York: The H. W. Gray Co.

"A New Esthetic of Music" is a rather ambitious title for the forty-five pages of miscellaneous and disjointed remarks which make up Mr. Busoni's little book; nor does a perusal of them make it quite clear what his "new esthetic" is, unless it be the suggestion that we should adopt the tripartite tone, or third of a tone, in our scale; but this would be nothing new, for such scales have long been in use in the East, while the Greeks apparently had quarter tones. Our present system teaches that there are twenty-four keys, but, in truth, says the author, we have at command only two, the major key and the minor key, the rest being merely transpositions, and "when a well-known face looks out of a window, it matters not whether it gazes down from the first story or the third." Be it so; but what marvellous works of art the masters have created with these "two keys," from Bach's "St. Matthew Passion" to Beethoven's ninth symphony and Wagner's "Götterdämmerung"! In the face of such mature and stupendous works of genius, one reads with astonishment that music is "a child that has learned to walk, but must still be led." It is also amusing to read that the harmony of to-day—and, therefore, that of all the great masters of the last three centuries—is "not for long; for all signs presage a revolution." The author might have added that the revolution is already on. Debussy, D'Indy, and Dukas in France, Strauss, and Reger, and a dozen others in Germany, are putting out their tongues and making dissonant faces at the harmonic system of the present and past. They would dearly welcome the tripartite tone as a new method of jugglery useful for hiding the inability to create melodies. Let a new Schubert, or Grieg, or MacDowell come, and he will not feel the need of a revolution in harmony.

There are some curious contradictions in Mr. Busoni's comments. On one page he asserts that Beethoven "incontestably achieved the greatest progress on and for the piano," and on another page he unwittingly corrects this assertion by writing that "most of Beethoven's piano compositions sound like transcriptions of orchestral works"; which is true, but cannot be said of a single piece by Chopin, the real discoverer of the pianoforte soul and of the possibilities of the pedal. It is odd that Busoni, who is most favorably known as a player of Liszt, makes no mention of him except once where he notes that in isolated passages he anticipated Debussy. But some of the aphorisms in the book are written in the true Lisztian spirit: "Is it not singular to demand of a composer originality in all things, and to forbid it as regards form? No wonder that, once he becomes original, he is accused of 'formlessness.'" And again:

> All composers have drawn nearest the true nature of music in preparatory and intermediate passages (preludes and transitions) where they felt at liberty to disregard symmetrical proportions, and unconsciously drew free breath. . . . But, the moment they cross the threshold of the principal subject, their attitude becomes stiff and conventional, like that of a man entering some bureau of high officialdom.

Dr. Theodore Baker has made an excellent translation of these pages of Busoni, which are not likely to overshadow his fame as a pianist. Nor can it be said that Mr. Gehring's "Basis of Musical Pleasure" does much to elucidate the problems of tonal æsthetics. One of the essays included in this volume is on the expression of emotions in music; in it the author avows that he has solved a controversy which for half a century has vexed the thoughts and stirred the passions of musical theorists. We are sorry we cannot share his satisfaction; sorry, also, to have to add that the whole book strikes us as an ill-digested treatise on the theories of Hanslick, Vischer, Schopenhauer, Sully, Gurney, and others who have written on the chaotic subject of musical æsthetics.

Of far more value, practical as well as æsthetic, is Harriet Ayer Seymour's little book, "How to Think in Music." It comes nearer to solving the highly important problem of how to interest young pupils in music than any book we have seen. In one typical case a girl, artistic to her very finger-tips, had been "learning to play the piano" for six years and had come to hate music. She was a victim of the prevalent mechanical mode of teaching. On being questioned, she admitted that there was one thing that interested her—a tune written by herself. "I loved to do it, and I can sing it." Here she had used her own mind, and the exercise of it had made her happy. "Teachers will find that all children are interested in thinking music, and that the interest grows where otherwise it is apt to flag." So well does this plan work that parents have become interested in the children's work to such an extent as to take up their own study of music once more. The value of folksongs is dilated on, and the author has found that boys like the Wagner motives, some of which are as simple as folksongs. For her method of teaching children to think music before playing it, the reader must be referred to the book itself.

The season at Covent Garden will open April 22 and will end July 29.

The revival of Mozart's "Magic Flute" in Berlin is to be characterized by unprecedented scenic splendors.

D'Albert's "Tiefland," a failure in New York, was recently performed in Berlin the three hundredth time, and in the season 1909-10 it had more performances in Germany's theatres than any other opera.

Oscar Hammerstein's London Opera House is already some eighteen feet above the pavement. It will have, among other things which his Manhattan Opera House lacked, arrangements for providing clean

air, the fresh air being forced into the auditorium at each level, and extracted by means of exhaust fans in the roof.

The most important musical event in Europe next autumn will be the Liszt Centenary Festival at Heidelberg (October 22-25). Its conductors will be Strauss, Wolfrum, Hausegger, and Mottl.

It is stated that Richard Strauss has cut and changed his "Rosenkavalier" in the version to be given at Berlin and Vienna.

Novello of London has published the Coronation Hymn, "The King, O Lord, in Thee This Day Rejoices." The words are by Dean Armitage Robinson and the music is adopted by Sir Frederick Bridge from Percy Godfrey's "Musicians' Company Coronation March."

Art

The announcement of Messrs. Jack of London includes a "History of Painting," by Haldane Macfall, in eight volumes, beginning with the Renaissance in Central Italy, and ending with the Modern Genius and the Painters of Japan.

The first volume of the "Dictionnaire des peintres, sculpteurs, dessinateurs, graveurs, etc., de tous les temps et de tous les pays" (Roger & Chernoviz), by French and foreign specialists under the direction of E. Bénezit, was announced for the end of January—price in subscription 50 francs, after publication 60 francs; the entire work, if it reaches three volumes, will be sold for 100 francs. It is to contain the biography of each artist; list of his works in museums, public buildings, etc.; the same in great collections; works that appeared in salons and expositions; prices obtained by the works at public sales; monograms and marks of particular collections, and signatures of principal artists, with a dictionary of monograms at the end of the entire work.

To characterize such a book as Mrs. Russell Barrington's "Essays on the Purpose of Art" (Longmans) with the civility expected in this column is difficult. The body of doctrine is drawn largely from the author's published lives of Watts and Leighton, who were her friends. Much is made of the contrast between British (*i. e.*, sincere and moral) idealism and the sensationalism and dryly intellectual impressionism which are French. To illustrate the point there is a long parallel between Delacroix and Leighton, where the apogee of solemnly well-informed futility is attained. The longueurs of the book are appalling as is the constant repetition of the same quotations and illustrations.

Buffalmacco's frescoes of the passion in the choir of the Badia, Florence, have recently been discovered behind a renaissance party wall, and now are published and described by Péleo Bacci in the January number of the *Bollettino d'Arte*. The recovered subjects include the Flagellation, March to Calvary, Ecce Homo, and Judas Hanging Himself. These themes are treated with a breadth of light and shade that anticipates Masaccio. A vehement realism, wholly alien to the nobility of Giotto, characterizes the work. Buffalmacco appears as a very great master akin to Pietro Lorenzetti, but much his superior. Dr. Bacci dates these extraordinary frescoes between the years 1330 and 1340. This discoverey will evidently involve considerable rewriting of the history of early Florentine painting.

Of all the alleged portraits of Shakespeare, the so-called death mask is perhaps the only one which possesses features of sufficient charm to do no overt violence to one's mental image of the poet—unless it be the Chandos portrait, but that has earrings! Unfortunately, the death mask is of somewhat obscure pedigree. It was found in a Mainz junk-shop by Ludwig Becker, a portrait-painter, in the middle of the last century; it had been picked up by Count Kesselstadt on a journey to England at the end of the eighteenth century; it has the date of Shakespeare's death, 1616, scratched into the plaster of Paris; that is really all we know of it. Professor Owen, the anatomist, and William Page, the American artist, among many others, have argued for the genuineness of the mask; but none more enthusiastically than Paul Wislicenus ("Shakespeare's Totenmaske"; Lemcke & Buechner). The Baconians have made the subject of Shakespeare's portraits their peculiar province, but Wislicenus attacks them with an eloquent fervor equal to their own. He attacks, too, Mrs. Stope's theory that the present bust of the Stratford monument was set up in 1746 in place of an earlier one, without pen and paper, to be seen pictured in Dugdale's "Warwickshire" (1656). The Dugdale portrait he describes as that of a failing hypochondriac, pressing a thick pillow to his abdomen in evident physical distress; a bad and careless sketch, as were those in Rowe's (1709) and Bell's (1788) Shakespeares, which show quite different heads. The reproduction in Pope's edition (1725), however, agrees closely with the present, that is, according to him, the original form of the bust and of the monument. The Stratford bust he believes to have been made from the Kesselstadt death mask, with the eyes opened, the cheeks fattened, and an expression of bourgeois geniality spread over the countenance by a local artisan. Apart from the discussion of Mrs. Stope's theory the booklet contains little that is new. The nineteen reproductions are excellent.

Stephan Beissel's recent volume, "Geschichte der Verehrung Maria in Deutschland während des Mittelalters" (Freiburg and St. Louis), is an excellent compendium. The author traces the worship of the Virgin back to Merovingian times, and proves that it is of Gallo-Roman origin. The 670 odd pages contain an exhaustive study of the material in the fields of literature and sculpture. There are 300 illustrations, many of works of art which have never before been reproduced.

Of all the Italian schools of painting that of Naples in the seventeenth century has received the least attention. Quite recently, however, we have noted a revival of this school, promoted especially by the director of the Corsini Gallery in Rome, and by the German, Voss, of the Berlin Museum. In this connection we welcome a new book by Wilhelm Rolf, entitled, "Geschichte der Malerei Neapels" (Leipzig: E. A. Seemann). The little that had been written on the subject embodied the worthless assertions of the lying De Dominici, who, in the thirties of the eighteenth century, ambitious to become the Vasari of Neapolitan art, counterfeited a whole mass of documents. The author has steered clear of these forgeries, and has created, for the first time, a standard book. He begins with the mural decorations of the Catacombs of San Gennaro and ends with the rococo painters; 140 plates illustrate the text. The only objection to the book is Rolf's curious habit of transliterating the names of Italian artists into German. We find "Jotto" instead of Giotto, "Johann Baptist" instead of Giovanni Battista, and, worst of all, "Eierschloss" in place of Castello dell' Ovo.

The book of Walter Limburger, "Die Gebäude von Florenz" (Leipzig: Brockhaus), is a thoroughly trustworthy reference book on the architectural history of Florence. It enumerates in alphabetical order 728 different buildings, ecclesiastical as well as secular, with concise topographical and historical information. There is an index of architects, and there is an alphabetical list of the names of streets, squares, etc., in Florence, together with a short account of the changes the names have undergone. Of the two volumes the second reproduces an exceedingly interesting chart of 1783. It would have been advisable to include also the wood-cut of Florence made about 1490, which is to be found in the Berlin Print Room, and which was first published a few years ago by Professor Brockhaus. The author has made use of all the latest investigations, and was careful in the choice of his authorities. The book is handsomely bound and well printed on light paper.

That accomplished student of English Gothic, Francis Bond, continues his series on "Woodcarving in English Churches" with a second volume, "Stalls and Tabernacle Work" (Frowde). The record is carried with plentiful illustrations from the scanty remnant of Romanesque stalls into the seventeenth century. As usual, Mr. Bond provides what ecclesiastical history is necessary to the understanding of these constructions. For elaborate beauty nothing surpasses the fourteenth century choir of Lincoln, though the perished tabernacles of York, of which drawings are fortunately available, were of a more complicated sort. The tabernacles of Lancaster Cathedral illustrate consummately the fantastic charm of the fully developed decorated style. This useful book closes appropriately with a chapter on bishops' thrones and similar seats of authority.

The death is announced from Paris, in his fifty-sixth year, of Emile Cagniart, landscape painter and member of the Société des Artistes Français. He is remembered particularly for his Vue du Palais de Justice, which was acquired by the state, and for views of the Meuse valley in Belgium.

John Merven Carrère, who died in New York last week of injuries received in an automobile accident, was an architect of national fame. He was born of American parents in Rio de Janeiro, Brazil, in 1858; was educated first in Switzerland, and later graduated from the Ecole des Beaux Arts, Paris. In partnership with Thomas Hastings, since 1884, he designed the Ponce de Leon and Alcazar Hotels in St. Augustine, Fla., the New York Public Library, the National Academy of Design, and other notable buildings.

Finance

A FALL IN RAILWAY EARNINGS.

Just as the Stock Exchange was seemingly passing into a state of outright cheerfulness—the railway rate decision itself, all circumstances considered, being cited as a stimulus to financial confidence—a sudden relapse in prices occurred, which for a day or two revived the gloomy sentiments of the week before. By some observers, this setback was ascribed to the call for an extra session of Congress, which by that time, with the Senate's failure to act on Canadian reciprocity, had become inevitable. The ground alleged by Wall Street for apprehension was that the Congress called for an extra session on April 4 is the Congress elected in the "landslide" of last November; that the Democratic majority cannot be restricted to action on reciprocity alone, and that if it takes up the tariff as a whole, it may open a Pandora's box of disturbing possibilities.

This consideration may have had its influence; but that influence was certainly secondary to another. While it was being discussed, the great railways of the country were publishing their full reports of gross and net earnings for January. Those statements were conflicting in their tendencies. Some showed gains over 1910, while others showed losses. Some reported largely increased operating expenditure, others did not. But the general run of comparisons was unfavorable. Now net receipts had on many roads been comparing unfavorably since the middle of 1910. That had caused no surprise; the increase in railway wages had a good deal to do with it; but it was calculated that in due course the expansion of gross receipts would take care of that. What startled the Stock Exchange in last week's January statements was the fact that, on so many lines, gross revenue itself showed a downward tendency.

Every one knew, as long ago as the beginning of last autumn, that a severe trade reaction was in progress in this country. People had seen the Steel Corporation's earnings fall from forty million dollars in the June quarter to thirty-seven millions in the three months ending with September, and to twenty-six millions for the last quarter of the year. This was a decrease of 35 per cent. in value of the commodities turned out for customers. The country's monthly iron production simultaneously decreased to a figure 34 per cent. below that at the end of 1909. This was safe measure of the general tendency of trade.

But the railway earnings, in the last months of 1910, did not seem to show the consequences. Even November, by the Interstate Commerce figures, gave the railways a million dollars more revenue than the year before, and December, by the *Financial Chronicle's* preliminary returns, scored a new high record for the month—the net, indeed, decreasing from 1909, but gross increasing $11,300,000.

How was this possible? If we can answer that, we may throw some light on the January statements. The explanation is, that volume of railway traffic cannot instantly reflect a decline in business activity. According to the last annual report of the Interstate Commerce Commission, the railroads hauled in twelve months 149,000,000 tons of agricultural products, 39,000,000 tons of products of animals, 771,000,000 tons of freight from mines, 165,000,000 tons from forests, and 333,000,000 tons of manufactured goods, merchandise, and miscellaneous freight—a total of 1,549,700,000 tons. Such a volume of business meant weeks and months of planning and ordering ahead on the part of the mercantile community. In some instances, weeks elapsed between the time of shipment and the day of delivery; in many cases, these were supplies and materials for half-finished work on industrial undertakings—work that had to be continued to prevent absolute loss of money already invested. Traffic of such proportions continues to move for a considerable time under its own momentum. This principle was never more apparent than in the sequel to the panic of 1907, when business throughout the country came to a dead halt in October; but when it was December before the first decrease in railway earnings appeared.

The January earnings statements are therefore quite in line with precedent; the remarkable fact, indeed, is that they show so little uniformity of contracting earnings. Union and Southern Pacific report for the month decreases in gross of $200,000 and $406,000, respectively; Atchison a gain of $544,000; Pennsylvania and Lake Shore reductions of $337,000 and $157,000; New York Central an increase of $298,000; Reading and Lake Erie and Western decreases of $72,000 and $26,000. Thus some of the roads even now show gains.

But the tendency for January was plainly downward, and the question is, what the railways will have to show in future months. For this, one may profitably go back again to the panic of 1907. After December of that year, monthly gross earnings continued to decrease from the year before, until May showed a falling off of $38,000,000, compared with a loss of only $3,000,000 in December. Then the decreases began to grow smaller, until December, 1908, when an increase of $9,400,000 was reported. What had happened is shown by the reduction from $50,963,000 in 1907 to $48,311,000 in 1908 in appropriations for maintenance of way and the reduction from $50,125,000 to $46,642,000 in appropriations for maintenance of equipment.

It has been the history of our railroads that decreases, whether in gross or in net earnings, are not sustained for any great length of time. During the trade reaction of 1903 and 1904, a halt occurred in gross and a sharp reaction was experienced in net; but 1905 witnessed new high records in both gross and net, and in each succeeding year the record was broken anew, until 1908. The recovery of 1909 brought earnings almost back to the high level of 1907, and in 1910 all previous high records were surpassed. These are the figures for the past decade, giving yearly receipts of all the companies per mile of road, and thus making due allowance for the effect of increased mileage:

	Gross.	Net.
1910	$11,822	$3,913
1909	10,509	3,498
1908	10,593	3,180
1907	11,275	3,845
1906	10,369	3,676
1905	9,507	3,309
1904	9,208	3,115
1903	9,170	3,238
1902	8,543	3,143
1901	8,043	2,951

During the year 1910 the railroads spent $60,572,000 for maintenance of way and $54,388,000 for maintenance of equipment—almost twice as much as had been spent in any year up to 1906. As a result, the railroads are in better physical condition to-day and better able to stand a temporary falling off in earnings than ever before in their history.

BOOKS OF THE WEEK.

Acker, P. Les Exilés. Paris: Plon. 3.50 francs.

NEW MACMILLAN BOOKS ON EDUCATION

The Principles of Education
By Ernest Norton Henderson, Ph.D.

The author is Professor of Education and Philosophy in Adelphi College, Brooklyn. After ten years' experience he possesses a wide view of present and past conditions, and a philosophical culture of mind which enables him to present a sane proportioned view of education as an evolutionary science. The editor of one of the best known journals of education is urging that instructors in training schools make the work a required text for all students and training teachers. Others rank the book as one of the first three essential for a teacher's library.

Cloth, 12*mo*, $1.75 *net*

The Training of Teachers for Secondary Schools in Germany and the United States By John Franklin Brown, Ph.D.

The author of "The American High School" describes concretely the standards and institutions which exist in Germany to-day, with enough of their history to show their evolution.

Cloth, 12*mo*, $1.25 *net*

The Teaching of Agriculture in the High Schools
By Garland Armor Bricker, *Ohio State University*

The subject has recently been brought into prominence all over the country and a survey of the problems involved will be found both interesting and useful. *Cloth*, 12*mo*, $2.00 *net*

Idealism in Education
By Herman Harrell Horne, Ph.D., *New York University.*

An interesting discussion of first principles in the making of men and women:—Heredity, Environment and Will. It touches the most vital point in modern education. By the Author of "The Philosophy of Education" and "The Psychological Principles of Education."

Cloth, 12*mo*, $1.25 *net*

Child Problems By George B. Mangold

This is scarcely an educational book, but is closely related to every consideration of a child's preparation for its true place in the nation. *Citizen's Library. Cloth, leather back*, $1.25 *net*

A History of Education During the Middle Ages and the Transition to Modern Times By Frank Pierrepont Graves, Ph.D., *Ohio State University.*

This work is a continuation of the author's "History of Education before the Middle Ages," and an exceedingly interesting analysis of little-known movements and their underlying principles.

Cloth, 12*mo*, $1.10 *net*

Educational Values By W. C. Bagley

By the Director of the School of Education, University of Illinois, Author of "The Educative Process" and "Classroom Management." *Ready very shortly*

A Cyclopedia of Education Edited by Paul Monroe, Ph.D.

The Editor-in-chief is Professor of the History of Education, Teachers College, Columbia University, Author of "A Text-book in the History of Education," "A Brief Course in the History of Education," etc., etc. *Volume I now ready. Send for a full prospectus, etc.*

Published by **THE MACMILLAN COMPANY** 64-66 Fifth Ave. N. Y.

Educational

The University of Chicago

Offers instruction during the Summer Quarter on the same basis as during the other quarters of the academic year.

The undergraduate colleges, the graduate schools, and the professional schools provide courses in Arts, Literature, Science, Law, Medicine, Education and Divinity. Instruction is given by regular members of the University staff, which is augmented in the summer by appointment of professors and instructors from other institutions.

1st Term June 19 to July 26
2d Term July 27 to Sept. 1

Detailed announcements are now ready for distribution, and will be sent upon application.

A word on Gettell's INTRODUCTION TO
POLITICAL SCIENCE

"This work is an admirable introduction to Political Science. We have long been in need of such a book, and the author has, therefore, placed under obligation students of Political Science throughout the country. The book shows not only a masterly grasp of the subject, but also remarkable power of condensation and coördination."—*Dr. Leo S. Rowe, Professor of Political Science, University of Pennsylvania, Philadelphia.*

GINN & COMPANY, 29 Beacon St., Boston

Introduction to Economics
By ALVIN S. JOHNSON,
Professor in the University of Texas.

"An illuminating presentation, in brief and compact form, of the leading results of modern economic analysis."—*Prof. T. N. Carver, Harvard University.*

Cloth. 416 pages. $1.50.

THIRD EDITION NOW READY

JohnBrown: ABiography Fifty Years After

By OSWALD GARRISON VILLARD

SOME TRIBUTES TO THIS REMARKABLE HISTORICAL WORK.

Philadelphia PUBLIC LEDGER. "A tremendous book; more thrilling than any book of fiction, powerful in its appeal, and which, while it is written soberly, as befits history, by the very nature of the narrative often rises to the highest dramatic level."

THOMAS WENTWORTH HIGGINSON. "I can only say after reading from first to last its more than 700 pages that I have never encountered anything this side of Gibbon's 'Rome' which has made me feel more the personal power of a single work."

JOHN T. MORSE, Editor American Statesmen Series, in ATLANTIC MONTHLY. "Perhaps in thus dramatically fashioning his volume, Mr. Villard obeyed an instinct rather than acted upon a preconceived plan; that is often the case with a great work, where a writer's feelings are deeply enlisted. Be this as it may, the merit and charm are none the less; he has seized well a splendid opportunity and has written one of the great biographies of our literatnre."

HORACE WHITE. "In my judgment a contribution to American literature to take rank with the very best historical writing of our time or any time. The only impartial history of the Kansas war."

ST. CLAIR McKELWAY in the Brooklyn EAGLE. "A biography replete with facts and marked by courage and candor, learning and justice."

Portland OREGONIAN. "The most valuable and comprehensive biography issued this season, and the best and most candid estimate of John Brown."

W. E. CONNELLEY in the Topeka CAPITAL. "The unprejudiced student and seeker for truth will herald the book as a great contribution to American history."

Des Moines CAPITAL. "More powerful in its appeal, more dramatic than any book of fiction, is this wonderful biography of John Brown."

The North Carolina REVIEW. "In this biography Mr. Villard has touched high-water mark. The book is a delight to the reader for many reasons. Full of life and movement, . . . written in an attractive and scholarly style, full of sympathy and yet without any loss in accurate presentation, it sets a new standard for biographical efforts."

Baltimore AMERICAN. "While the book has popular features in that it is entrancingly interesting, its scholarship is of the highest order and its style reminds one a little of Anthony Froude. . . . Mr. Villard has illustrated in this book the finest ideals of literary conception and execution."

London TIMES. "It is scarcely likely that any later writer will be able either to add anything of importance to Mr. Villard's collection of material or to better his interpretation of the whole story. . . . It at once becomes the standard, and probably the final authority on its theme."

Washington (D. C.) STAR. "Mr. Villard draws a compact, vivid, historic picture of the terrible focussing of this period upon our Civil War. Straight and clear in its literary way, this biography is a marvel of research and fair-mindedness."

HENRY WATTERSON in Louisville COURIER-JOURNAL. "No fault may justly be found with Mr. Villard's telling of the story. It is minute and lucid, altogether fair and unvarnished."

Burlington (Iowa) HAWKEYE. "It is a book which will take a place in the library of every well established home in this part of the country."

First Edition, October 1st;
Second Edition, November 21st;
Third Edition, March 1st.

Fully illustrated with portraits and other illustrations. With copious notes and bibliography.

PRAGMATISM AND ITS CRITICS

By ADDISON W. MOORE

294 pages, 12mo, cloth; postpaid, $1.36

This is the clearest and most satisfactory summing up of the controversy that has yet appeared. Even the most technical matters are presented in such a way as to be intelligible to anyone who is genuinely interested in the movement. The book covers all the important points at issue, but special emphasis is laid on: (1) The historical development of the pragmatic movement; (2) Its relation to the conception of evolution; (3) The social character of pragmatic doctrines.

The treatment is sympathetic and incisive.

The University of Chicago Press - Chicago, Illinois

THE CHRIST MYTH

By ARTHUR DREWS, Ph.D.

Professor of Philosophy at Karlsruhe

This book is an able attempt to show that the origin of Christianity can be accounted for without the assumption of an historical Jesus. By a comparison of the myths current in the early Christian period with the Pauline Epistles and the Gospels the author reaches the conclusion that Jesus was not a historical figure, but the suffering God of a Jewish sect, to whom the metaphysical speculation of St. Paul gave universal significance.

As a scientific and well-documented study in comparative religion the work is likely to be of much interest, even to those who are not able to accept the author's more extreme views.

"'Die Christusmythe,' by Arthur Drews, has stirred the heart of Protestant Germany and roused it into keen opposition. It is an esay in Christian mythology on lines similar to those followed in Mr. J. M. Robertson's 'Pagan Christs' and 'Christianity and Mythology.' Only faint echoes of the controversy which Drews has called forth have reached our shores, but with the appearance of an American edition his book is not unlikely to become a storm centre of Christian thought here as elsewhere."—*The Inquirer.*

By PERCY BREBNER. A new romantic novel by the author of "The Princess Maritza." *Illustrated. Net,* $1.20 (*postage,* 12c.).

Published by Cassell & Company (*Founded 1848*), 43-45 East 19th St., New York

NEW BOOKS

THE INTELLECTUALS: An Experiment in Irish Club-Life

By CANON P. A. SHEEHAN, Author of "Luke Delmege," "Parerga," etc. Crown 8vo. $1.50 net. By mail, $1.64.

A description of 37 sessions of a Literary Club established in a town in Ireland under the Chairmanship of a Catholic priest, and composed of members of different nationalities and creeds, who meet together every week, and present papers for discussion on all questions of interest in education, science, religion, politics, etc. The book is interspersed with essays, poems, and free discussions on them; while the whole thing is strung together on a slender string of romance.

A SAGA OF THE "SUNBEAM"

By HORACE G. HUTCHINSON. With Illustrations. 8vo. $1.75 net.

This is the story of the latest cruise of the "Sunbeam," owned and navigated by Lord Brassey. It tells of a journey to Iceland, Newfoundland, up the St. Lawrence, the coast of Labrador, down through the Gut of Canso, and home again.

JOHN VIRIAMU JONES, and Other Oxford Memories

By EDWARD BAGNALL POULTON, D.Sc., Professor of Zoology in the University of Oxford. With 5 Illustrations. 8vo. $3.00 net.

An account of the Oxford life, and some details of the subsequent career for the first Principal of the University College of South Wales and first vice-chancellor of the University of Wales. Some memories of the Oxford Union in the '70s are given, with reminiscences of Lord Curzon, H. H. Asquith, Lord Milner, and others.

RECOLLECTIONS of a SCOTTISH NOVELIST

By L. B. WALFORD. With Illustrations. 8vo. xii+317. $3.00 net.

"Mrs. Walford has written 45 novels and besides has seen not a little of social life in Edinburgh, London, and elsewhere. Consequently her "Recollections," covering so long a stretch of time and giving glimpses of so many phases of life, is full of interest and charm."—*N. Y. Times.*

NEW SCIENTIFIC BOOKS

MODERN METHODS OF WATER PURIFICATION

By JOHN DON, A.M.I.Mech. Eng., and JOHN CHISHOLM, A.M.I.Mech. E., Engineer and Manager of the Airdrie, Coatbridge, and District Waterworks. With 96 Illustrations. 8vo. pp. xvi+368. $4.20 net.

Mr. Don's paper on "The Filtration and Purification of Water for Public Supply" was selected by the Council of the Institution of Mechanical Engineers for the first award of the "Water Arbitration Prize." The book will interest not only the water engineer and Public Health Officer, but also all who recognize the paramount importance to modern towns of a water-supply above suspicion. A full description is given of modern methods of filtration.

The Nation

NEW YORK, THURSDAY, MARCH 16, 1911.

The Week

Reports that President Taft will use his veto to prevent any tariff ameudment by the extra session of Congress, except the enactment of the Canadian reciprocity agreement, should be taken with a very large grain of salt. It is said that he would oppose even a revision of the wool schedules—which he has declared to be "indefensible"—since he does not believe that Congress will be in possession of "scientific data" upon which to proceed. But whatever the Tariff Board has can be turned over to the Committee on Ways and Means. And as the President is on record as holding that even the "data" laid before Payne and Aldrich left no doubt that the woollen duties were made outrageously high, it is difficult to see on what ground he could oppose their reduction. He certainly would not wish to make it appear that he would not accept from Congress in April or May what his friends say he intends to urge it to do in December! As for other legislation in the extra session, Mr. Taft only echoes the common hope that little will be attempted. An apportionment bill ought to be passed, inasmuch as the Republicans failed in their Constitutional duty to pass one in the Sixty-first Congress; and the intervals of business might well be utilized to put through the Constitutional amendment for the direct election of Senators. But in general the sooner the extra session does its necessary work and adjourns the better the country will like it, and the stronger will be the position of the Democrats.

Ex-Senator Burkett of Nebraska is so recent an ex-Senator that his opinion must still be taken as representative of a certain body of opinion at Washington. Why was Mr. Burkett against Canadian reciprocity? Because it was against the interests of his constituents:

> It costs a Nebraska farmer 20 cents to raise a bushel of corn, and it costs 5 cents more in Illinois. When corn gets down to 20 cents the farmer cannot buy anything, and furthermore he can't pay more than $12 or $15 a month for help. When corn gets down to 15 cents, as I have seen it do, the farmer can afford to raise only enough to use about his place. When it is up to 35, the farmer pays $30 to his help, gives his children the best possible in the way of education, and buys automobiles.

The fine old statesmanlike way of putting things—how familiar its accents fall on the ear! Either the farmer must sell corn at the cost of production or else he must sell it at a profit of 75 per cent. Either the farmer must feed his crop to the pigs or else he must ride in automobiles. Either the farm-laborer must get twelve dollars a month or else he must get two and a half times as much. A golden mean between the extremes of destitution and opulence is inconceivable, and it is the mission of every real government when it finds the farmer badly off to clap on a sufficiently high tariff to give him an automobile.

Sir Wilfrid Laurier's speech in favor of reciprocity was as statesmanlike as it was astute. The timid souls were reassured against the spectre of annexation by as ringing a patriotic manifestation as any loyalist heart could desire. "Rather than part with our national existence, we would part with our lives," are strong words in the mouth of a Prime Minister; strong enough to undo whatever harm may have been done by the threatened invasion of Canada by Mr. Champ Clark and Mr. Bennet. There remains the inevitable trend towards an economic understanding between the two nations, a development that has been recognized by both parties in Canada for the last forty years, and which only the exigencies of practical politics have caused the Opposition to disown. Honest antagonism to the commercial agreement with the United States undoubtedly exists in Canada. It would be idle to say that even an oppressive or iniquitous system does not bind up to itself the interests of very many decent people. But that somebody has to suffer in the curing of an evil is a principle that must be reckoned with.

The appointment of Justice Charles E. Hughes to head the commission to investigate second-class postage rates is the best possible assurance that its work will be both judicial and thorough. Mr. Lawrence Maxwell, the second member appointed, a Democrat who was Solicitor-General under Mr. Cleveland, will also add to its strength. With the help of such men, the facts ought to be brought out. We have not believed that the method of taxing advertisements in magazines was either practical or wise; but we are chiefly concerned that the investigation should be broad and thorough and free from the usual tendency of governmental commissions to take the official view. If the inquiry is to be far-reaching it is bound to go into other questions than those affecting the magazines. The whole problem of the second class involves the management of the Department, the question of politics within it, of incompetent postmasters and a too little used plant. Such a commission must inevitably, if it decides in favor of the magazines or does not, point out the waste and extravagance and indicate other ways of saving and of making money.

Travelling expenses are well known to be like charity in covering a multitude of—well, different things. It has but just now been discovered that the annual travelling expenses of the Government of the United States amount to $12,000,000 a year. This fact has been unearthed by the President's commission on efficiency and economy in governmental methods. The reason why it has been so long hidden is that no single account or bill has ever shown the total. The figures are tucked away in miscellaneous and contingent-expense accounts of the various departments. President Taft's attention has been drawn to the large sum which it appears, on analysis, that the Government is paying for the official journeyings of its servants, and he is said to have expressed the purpose to have the whole business systematized. His private secretary, Mr. Norton, referred to the matter in his recent address before the Union League Club of Chicago, and stated that surprising differences had been found in the expense accounts for travel turned in by different departments. In the mere question of railway transportation to New York and return, for example, it has been found that the employees of some bureaus can make the

trip for 10 per cent. less than others. If there is thus a possibility of saving as much as 10 per cent. on the whole $12,000,000, the taxpayers are entitled to have it made.

The adjournment of the Indiana Legislature is made the occasion of greater praise for its record than such bodies usually receive. And yet it barely saved itself in the last two weeks of the session. Up to that time a strong bipartisan combination, supplemented by a vigorous lobby, threatened to waste completely the Democratic opportunity. Toward the end, however, the Democrats waked up to their well-nigh lost chance to do what they were elected to do, and redeemed their campaign promises of a child-labor law, a weekly-wage law, a registration law, an employers' liability law, and measures strengthening the public accounting system. Still more gratifying is the enactment, with the coöperation of the Republicans, of a corrupt-practices act. Among bills that failed was a franchise-referendum bill. Why the Republicans should have opposed this, after their "progressive" campaign of last fall, is a mystery that will help the Democrats as much as their rally at the last to prevent the session from being barren.

The new Governor of South Carolina, Blease, who wants to stop the education of the negro in that State, is not going to have things all his own way. Mr. Charles L. Coon, the able superintendent of schools in Wilson, S. C., is not afraid to speak out about the value of real education for the colored man and to point out what a shame the present public-school education so often is. Thus Mr. Coon brings out the facts in regard to the negro schools in Alexander County in reply to a letter in the Charlotte *Observer* from a citizen who thinks that there is too much education there. It appears that there are 287 colored children of school age in that county; that 224 attend for the school term of only *sixty-five days;* that the total value of negro school property is but $309, and that the total amount paid for teaching the negroes is but $412.32 a year, at the rate of $51.54 per teacher per year! As Mr. Coon says, what the white man is really complaining about is the lack of negro education. Surely, he says, "a county that is making such a showing cannot seriously claim that it is trying or has tried the experiment of negro education."

Instead of resorting to abuse and anonymous threats, Mr. Gompers and the others who are opposing the installation of power presses in the Bureau of Engraving and Printing would do well to devote their energies to framing a reply to Assistant Secretary of the Treasury Andrew's temperate and apparently conclusive statement. Starting with the fact of the increase of the business of the Bureau at such a rate as altogether to outstrip its present equipment, Mr. Andrew points out that the only alternative is to enlarge the output without expanding beyond the bounds of the building. The Bureau investigated the possibility of making a change from hand presses to power presses, without displacing any of the present employees, and without lowering the technical standard of the work. It was found that every employee now engaged on the hand presses could be retained, if power presses were installed in the course of three, or at most four, years. In the bill repealing the mandatory provision for the use of hand presses, the substitution of power presses is distributed over five years. The investigation of the quality of work produced upon power presses was made in the presence of members of the Plate Printers' Union and under adverse conditions, but the most expert of the plate printers could not distinguish among the notes produced in the two ways. The part of the statement that should receive the most careful attention of those who are fighting the change is the declaration that many of the employees of the Bureau would welcome it, because work with power requires less physical labor, is much less apt to produce internal injuries, and is from 30 to 40 per cent. better paid. That the substitution would relieve the Bureau of its unenviable distinction of being the only large engraving plant in this or any other country which prints from engraved plates upon a large scale by hand presses, and would save the Government at least $700,000 a year, must impress the mere taxpayer, though, of course, beneath the notice of Congress.

Mr. Bryce closed his recent address at the City Club in New York with a note of hopefulness about American municipal government. With a knowledge of our city misgovernment now extending over forty years, and as a close and eager student of existing conditions, Mr. Bryce is one whose testimony cannot be lightly set aside. The immense work yet to be done is not, of course, denied by this clear-eyed observer, but he bases his good hopes for the future upon the evidence that Americans are giving attention and energy to city affairs as never before. Our difficulties are obvious, our mistakes and our disappointments have been many, but we are still keeping at it, and there are solid grounds for believing that we shall work out into a better state of things. Everywhere there is a tendency to make national party politics count for less in city elections; everywhere there is a growing insistence upon having municipal officials with sufficient power to carry with it the fixing of responsibility; there is much promising experiment with new forms of city government; there are more civic organizations working for reform; there is appearing a distinct spirit of municipal patriotism. In view of this, we should be foolish to despond when a man like Mr. Bryce bids us hope.

New Hampshire will cover herself with disgrace if she fails to save the magnificent Crawford Notch from the deadly injury not only threatened, but already being inflicted, by lumbermen who have begun cutting down the forests. The bill before the Legislature authorizes the Governor and Council to take possession under the right of eminent domain; and it is stated by those who have made a careful inquiry into the situation that the sum of $100,000, appropriated in the bill, will be sufficient to save the forests of the Notch. This is so trifling an amount in comparison with the object attained that it would seem incredible that there should be any doubt of the action of the Legislature were there not such a melancholy record of its conduct in past years in similar matters. But there have been two changes which ought to assure success this time. The nomination and election of Gov. Bass testified to the arousing of a new spirit of citizenship in New Hampshire; and the passage of the national forests bill by Congress supplies a new encouragement and incen-

tive. With the Federal Government looked to for the saving of the forests in the upper White Mountain region, New Hampshire ought to be more than glad to do her part at the Crawford Notch.

Now that President James of the University of Illinois has put into motion a scheme for the working out of a complete constitution for the university, to be framed upon the initiative of the University Senate, it seems surprising that such a project has not been undertaken before this. However, it is only within recent years that the class of questions with which the constitution will be most seriously concerned has attained great prominence in American educational discussion. The tremendous growth of the State universities of the West has given to these institutions a place quite unknown in former times: and the active part taken by many of them in the development of matters immediately connected with government and the general welfare has greatly heightened the interest with which they are regarded. But it is not only in the State universities that there has been either great increase of numbers or essential widening of the field of action. Our leading Eastern institutions have become real universities, instead of merely institutions for the ordinary instruction of undergraduates; and furthermore the sectarian control which a few decades ago was dominant, now plays a very minor part. The time is therefore ripe for thoroughly examining the organization of American universities, and the professors who constitute the Senate of the University of Illinois have an opportunity to help in the establishment of sound principles in this important domain.

Other causes than the handicap of a totally unsuitable building must enter into the failure of a project like the New Theatre movement. But it would be premature to look for such other causes in face of the fact that the New Theatre project in its entirety has not yet been admitted a failure. On the contrary, the founders of the New Theatre strongly reaffirm their faith in the underlying idea of an enterprise that has cost them nearly half a million dollars. And they are quite right. Stone walls do not a playhouse make—or unmake. The play and the players are the sum and substance of the problem. On these points we have comforting reassurance. Efforts to build up a good stock company are to be continued, though the New Theatre players will not be seen in this city for a year, or until their new home is ready for them. But it may very well be that a year of "barnstorming" will supply valuable training. As for the play, it is reassuring to be told that nothing will be abated from the original design of putting art above commerce. With the essentials of the scheme kept intact a new start is to be made. But while the incubus of the marble palace on Central Park West is to be thrown off, it would be well to keep in mind that other mistakes than those in marble have been made. It is not yet time to say, "Now we are safe." A vast deal of labor is still ahead.

The reported attack upon the freedom of the college press turns out to be without foundation. President Lowell, indeed, is now quoted as assuring the trembling editors of the *Lampoon* that he thought their daring cartoon a good joke, and that Lyman Abbott himself, far from taking offence, would so regard it. Thus encouraged, the enterprising publishers announce a second edition. What the Carnegie Foundation will say about the incident in its next report it would be idle to speculate. Does it indicate a waning in the power, or, worse, in the ideals of university presidents? Was it a wily move on the part of the head of Harvard to win publicity for himself? There is undoubtedly an increasing sensitiveness among college professors because of their subordinate position in the college world, where one mediocre quarterback receives more of the sort of recognition that counts than the combined body of those to whose lectures he attends through the medium of typewritten notes. But even this feeling appears hardly sufficient to account for an action just the reverse of what would have been expected. President Lowell seems to have forgotten his scholastic dignity in a smile at the richness of undergraduate humor.

British public opinion has gone beyond the point of evincing a pretty firm mind not to take Lord Lansdowne's Rembrandt off his hands by a national subscription. The newspapers are now asking angrily, what right has a man of Lord Lansdowne's position to throw the picture on the market at all? Legally the noble lord's property, the threatened Rembrandt is characterized as being actually a national treasure of which its owner ought to regard himself as merely the steward. Thus Lord Lansdowne's offer to let the public have his picture at a 5 per cent. reduction from the half-million offered by a hideously wealthy American, is met with the bold counter-proposition that when the nation refuses to purchase a rare art-treasure, no one else shall be allowed to take it. In Italy the chief art collections have been catalogued and the exportation of any piece so registered is forbidden. The law is violated because many an Italian nobleman has to choose between poverty and his pictures. Is that the case with Lord Lansdowne? The former Governor-General of Canada, Governor-General of India, Secretary for War, and Foreign Secretary has only four houses to live in, as we read in "Who's Who," and only about 143,000 acres on which to take his exercise. Yet with the present high cost of living——

It was not M. Jaurès or Herr Bebel who gave utterance recently to the following words of warning in the course of parliamentary debate:

> It is the most civilized nations that spend the most on armaments. Unless the mischief is brought home to men's feelings as well as to their minds, the growth of armaments must in the long run break civilization down. Some think it will end in war. *I think more likely it will end in international revolution.*

The speaker was Sir Edward Grey, Mr. Asquith's secretary for foreign affairs. Any such hearty pronouncement against the evil of bloated armaments from such a source would have been significant. It is doubly significant that Sir Edward Grey should have admitted the validity of the menace which the Socialists almost from the beginning have raised in protest against the excesses of militarism and imperialism—the menace of international revolution. The jingo argument is losing its effectiveness as a pacifier of internal discontent. And in every country, and at the peril of being called anti-patriotic and worse, there are brave men to plead the needs of internal social progress against the reckless multiplication of war machinery and war debts.

THE MEXICAN AFFAIR AND THE LAW.

The country is still left very much in the dark concerning the real reasons for the dispatch of 20,000 American soldiers to the Mexican frontier. The first pretence of "manœuvres" was promptly abandoned. It was soon admitted by the Administration that some other motive existed than to exercise the troops and see how our machinery for mobilization would work. But we are yet without an official explanation of the movement. Rumors and hints abound, but no precise statement has been made. If Congress were in session a demand would undoubtedly be made that the President should take the nation into his confidence. As it is, we are left groping. Was the action taken in consequence of representations by the Mexican Government? Had the State Department been urged to move in behalf of American investors in Mexico? Was the whole thing simply the result of a nervous desire to "do something"—always a dangerous thing in public affairs—complicated by an unexpected fanfaronade of advertising by our military authorities? We do not know. No accurate information has been vouchsafed the country, and it must wait with what patience it can for more light.

It ought to be regarded as perfectly clear, however, that some of the excuses given and explanations assigned in the press have no validity whatever. It has been alleged, for example, that it is the duty of the United States to prevent the shipment of arms across the border, and that the presence of a large body of troops is necessary in order to discharge this assumed international obligation. But no such obligation exists. Nothing of the kind can be found in the entire chapter of the Revised Statutes of the United States relating to neutrality. A "military expedition" set on foot on our territory is, of course, illegal; it is made a misdemeanor for an American citizen to "enlist" on the soil of his own country to serve in a war in a country with which we are at peace; attempts to fit out a "vessel of war" in like circumstances, are declared illegal, and subject any citizen of the United States guilty of them to a fine of $10,000 and imprisonment for ten years; and collectors of customs are bound to detain any ship "manifestly built for warlike purposes" of which the cargo shall consist "principally of arms and munitions of war." But the sale and shipment of arms to either belligerent are not forbidden. Arms are, of course, sold and shipped subject to seizure as contraband, but that is the affair of the owner and consignee, not of the Government. There can be no ground, therefore, for the assertion that our soldiers are sent to the border to prevent the sending of rifles and ammunition across it. No obligation, either legal or moral, rests upon our Government to undertake to prevent it.

Another reason vaguely given for the concentration of troops in Texas is that we must be prepared to "protect" American property in Mexico. That property is undeniably very large, and is scattered up and down the republic. Its "protection" by soldiers in San Antonio would be a difficult task. If mines owned by Americans are seized by insurgents in Durango, or railways broken up in Oajaca, in which American capital is invested, no long-distance shooting from the north bank of the Rio Grande will do any good. Whatever protests or demands might be in order would have to be made through diplomatic channels and from Washington. It would be a matter for pen and paper, not khaki and bullets. Quite aside from that, there is a great deal of confusion of thought on the whole subject of the relation of our Government to its citizens engaged in business in foreign countries. It is just as true of Americans who invest capital or buy property in Mexico as it is of those who do the same thing in England or France, that they take the step at their own risk. They are subject to the local jurisdiction. The sole duty of our Government in the premises is to insist that no discrimination be made against them, that they shall enjoy the same legal and judicial safeguards as natives, and that if their property has been taken without due process of law or destroyed by a mob or an insurrection, their claim to compensation shall be duly considered by the established Government. The United States does not undertake to collect the debts of its citizens in foreign countries—not even if the money is owed them by the Government itself. It would not employ its land or naval forces to compel the execution of a contract between another country and a citizen or citizens of our own. All those matters are for the courts of justice on the spot or for peaceful diplomatic adjustment.

Hence the mere fact that the amount of American capital employed in one way or another in Mexico is very large has nothing to do with the case. Whether the sum be $500,000,000 or $1,000,000,000 the principle remains the same as if it were $30. If any American citizen, rich or poor, is deprived of his rights in Mexico, our Government is, of course, bound to take the appropriate steps; but there is only mischief in the notion that an army must be mobilized and cruisers ordered to sail just because large American investments abroad may be in danger of suffering temporary losses. And it would be well for any of the eager gentlemen who are thinking of their big "claims" against Mexico in consequence of the insurrection to bear in mind what happened to American claimants in Cuba. Our Government assumed in the treaty their $50,000,000 or more of claims against Spain, and then set up a Claims Commission which proceeded to repudiate nine-tenths of them on the ground that they were not warranted under international law. It is not a bad thing to look at the law of nations before you leap.

THE CORPORATION TAX DECISION.

It is necessary, in considering Monday's Supreme Court decision upholding the Corporation Tax of 1909, to distinguish between approval of the character, purpose, and origin of the law, and affirmation that its enactment was constitutional. The second of these functions is all that the Supreme Court performed. We mention this somewhat obvious fact because of a tendency, visible in some discussions of the matter, to assume that the court of last resort has put its seal of general approval on the measure. It has by no means done any such thing; the wisdom or unwisdom of the tax in question, and of the manner of imposing it, is quite as open to debate as it was before the Supreme Court held the statute constitutional.

That the court would so declare it has, we imagine, been expected by the majority of lawyers. In the first place, the Supreme Court is traditionally reluctant to throw out a law of Congress, save on the clearest showing that the national legislature had exceeded its

powers. The chief burden of the long list of Supreme Court decisions has been interpretation and application of laws already admitted as constitutional in their general principle. Even in this Corporation Tax decision, the court has so construed the law as to exempt from its application certain corporate bodies from which the Government had already claimed the tax.

The Corporation Tax provision, unlike the Income Tax provision of 1894, was drawn up with great care to anticipate constitutional objections and to conform to previous court decisions. In particular, it had in mind the clause of the War Revenue act of 1898, which imposed on companies refining oil or sugar a special excise tax equal to one-quarter of one per cent. on the gross amount of all receipts in excess of $250,000. That statute was reviewed and upheld by the Supreme Court. The unanimous decision of the court, in favor of the Act of 1909, is based on similar grounds. Justice Day's opinion sets forth that the income tax of 1894 "was held to be direct, because imposed upon property simply because of its ownership," but that, "in the present case, the tax is not payable unless there is a carrying on or doing of business in the designated capacity." "The difference between the acts," the opinion declares, "is not merely nominal, but rests upon substantial differences between the mere ownership of property and the actual doing of business in a certain way."

To the contention that the law is unconstitutional for want of uniformity because imposed on corporations and not on partnerships or individuals, it is in like manner answered that the privilege of doing business as a corporation is taxed, and not the mere doing of business. The argument that, by taxing a State-chartered corporation, the national government unconstitutionally invades the prerogative of the State which granted the charter, is dismissed by the court on the ground that, in the nature of things, Federal excise taxes "must be collected from the same activities as are also reached by the States in order to support their local governments"; and that "if this were not true, citizens could invalidate the taxing power of the nation simply by continuing their business under a State franchise."

To recognize, however, as the people are now bound to do, the constitutionality of the corporation tax of 1909, does not necessarily involve recognition of its wisdom. There were some serious objections to that tax, wholly apart from its constitutionality. That it involved double, and in some States and cities triple, taxation is one of these objections. That it opened the way for increasing and oppressive taxation, on lines which might reach a factitious popularity, is another. These considerations bring up a possibility which the authors of the law may not have contemplated—namely, that the host of small private business enterprises and partnerships, which of late years have sought incorporation as a mere matter of convenience, may be induced in at least some instances to return to their original form of organization. If such a movement were to be widespread, the general government would not only have in part defeated its own expectations, but would indirectly have struck a blow at the revenue which the States now draw from their taxes on corporations.

Again, there is the so-called "publicity feature." Mr. Taft's official endorsement of the Corporation Tax law was largely based on his idea that through its provisions "we should be incidentally able to possess the government and the stockholders and the public of the knowledge of the real business transactions and the gains and profits of every corporation in the country." The *Nation* has for many years taken the lead in demanding publicity of earnings and accounts on the part of great corporations whose securities are afloat on the general investment market, and it is needless for us to say that guarantees of such publicity are in themselves a salutary thing. But whether such compulsion, direct or indirect, ought to be extended to minor concerns which make no appeal to the investment market, whose stock and bonds are held by a small group of individuals connected with the enterprise, and whose interests might be jeopardized, as those of the great corporations would not be, through possible opening of their accounts to competitors, may be another question.

These are not merely retrospective considerations. They should be kept in mind in view of the fact that, with tariff revision a probability of the future, and with the constitutionality of the corporation tax affirmed by the highest court, the temptation for Congress to amend that tax in the way of still heavier burdens may bring up again the whole discussion.

MOB-LAW AND PROSPERITY.

Secretary Dickinson did well in his address before the Southern Commercial Congress to lay great stress on the direct connection between lawlessness and prosperity. Ranking mob-killings as the worst of crimes, worse than rape, in that they strike at the root of our social structure and make criminals of masses, he declared emphatically that "there can be no general and steady economic development where there is a general non-enforcement of the law."

It is, of course, far better when opposition to injustice and wrong is based on some other ground than a pecuniary one. But the great masses of people must often be reached through the pocketbook before they can be really wakened to the injury they are doing themselves and others by dangerous and base practices. Hence we have long felt that the time must come when the South would regard many of its gravest problems not from the standpoint of prejudice and hatred, but from that of what is wisest from the commercial point of view; from that standard to the higher one the progress ought to be certain. So, in the matter of lawlessness, the realization is coming, not only that, as Secretary Dickinson points out, lynch law regulates nothing and puts an end to no crime, but that it inflicts heavy pecuniary loss and sensibly retards that extraordinary commercial development which is doing such wonders for the South and compelling the admiration of all who witness it. That this is no exaggeration is perfectly plain from the experience of the very city in which Mr. Dickinson spoke. Three days after the Atlanta riot in 1906, Charles T. Hopkins, a member of the Chamber of Commerce, and a prominent Atlanta business man, said publicly:

> Saturday evening at eight o'clock, the credit of Atlanta was good for any number of millions of dollars in New York or Boston, or any financial centre; to-day we couldn't borrow fifty cents. The reputation we have been building up so arduously for years has been swept away in two short hours, not by men who have made and make Atlanta, not by men who represent the

character and strength of our city, but by hoodlums, understrappers, and white criminals.

Thousands of dollars worth of orders were cancelled at that time and heavy losses sustained by merchants; and that Atlanta experience has been repeated elsewhere. Indeed, the last time such a riot occurred in a considerable Southern city a determined effort was made to minimize the news of it, in order to prevent injury to the town. We may expect that before long mobs in cities will disappear, even while they linger in the rural regions, because it will be found that they do not pay. Certainly, those who inveign against them on grounds of justice and humanity are also pleading for progress, for business stability, and for prosperity. Not without cost does Birmingham, Alabama, bear the bad name of showing more murders in a single year than are committed in all England, including London. Indeed, it is an open secret that Southern lawlessness is one reason why the Italian Government is not favorable to the settling of its citizens in the Southern States and prefers to see them heading for South America, where lynching is unknown.

But how best may mob-law be combated? For one thing, by just such frank utterances as Mr. Dickinson's, since they go far toward encouraging others to denounce the rioters even when they appear to be "citizens of standing." Most important of all is, however, an insistence in season and out of season that, as Mr. Dickinson puts it, the same protection be given to the negro "for person and property under the law as we give the white man." There is far too often a failure of justice for the negro in the courts, and the very fact that there are two kinds of law, that colored men are excluded from juries, that a white man's word is invariably taken against a negro's—all these things play into the hands of the mob spirit. Fortunately, there is a rapidly increasing public sentiment against them. When a successful effort was made to save the life of Pink Franklin, who was unjustly sentenced to death in South Carolina, the Northerners interested in his fate found hearty coöperation in that State and the generous support of such newspapers as the Charleston *News and Courier* and the Columbia *State*.

The truth is, of course, that injustice invariably injures those who inflict it far more than those who suffer it. In pleading for the enforcement of law Mr. Dickinson really works for the moral advancement of his own race. Its leaders boast, with justice, of their material progress; the moral must keep pace with it. Then, too, the negro is the South's greatest asset. How can he be made economically most effective? Not by depriving him of life and limb at the pleasure of a mob; not by depriving him of his rights of citizenship. He needs precisely the same incentives to labor as does any other man who is struggling upward—security, the right to hold property, to obtain justice, to say how his children shall be educated and his taxes spent, and to lift himself in the industrial scale. And the greatest of these rights is that justice which is at the basis of our whole democratic structure.

OUR DEARTH OF SATIRISTS.

American civilization has been accused of so many defects that we should have thought it impossible to suggest a new one. Certainly, we should have failed to divine the charge that is made against us by Henry F. Urban, author of "Die drei Dollarjäger aus Berlin," in an article in the current number of the *Rundschau Zweier Welten*, entitled "Why America has no Satirists." One's first impulse is to reply, "But we have." Our critic, however, knows better, and affirms in so many words that there is not a single American "Witzblatt" that dares to hold the mirror up before "our godlike Yankees." There are, he freely admits, some sugar-water journals which pass for satirical and are written for lemonade-sipping maidens and youth, but he would give a kingdom for a *Simplicissimus* in what he, with original wit, calls "Dollarika." His keenest pain comes from his own expatriated countrymen, many of whom share that dislike of satirists which he has the glory of discovering as our national trait. These stupid German-Americans regard it as the final demonstration of their Americanization to permit no jesting upon anything American. According to their way of thinking, a satirizer of their adopted country is not merely an ignoramus, but a traitor.

The anomaly which strikes our gracious critic is the lack of satirists in a land where they should grow wild. There is no people, he assures us, so rich in grotesque weaknesses and contradictions as we. We have first our Puritanism, and then our Dollarism, our inequality and lack of freedom in those who want money, our petticoat-despotism, our religious hysterias, and our benightedness in considering American culture superior to all other. One would think, he adds drily, that all this would be matter for satirists. But he has waited and is still waiting for the great American satirist, who, like the great American novelist, seems determined to escape detection. Where is he? he cries. And then he recalls the fate of Herr Münsterberg and his unappreciated "American Traits." An American who shows up American weaknesses is no American, but a criminal; an immigrant who does it deserves to be lynched. And if we ask the cause of our deficiency in this respect, we learn that it is our "comic self-adoration" which renders us unable to bear the truth. The cultivated man one knows most surely by his ability to recognize himself and to be patient with a critic of his weaknesses. For this reason Bernard Shaw is a sign of high English culture.

Our chief regret in connection with this analysis of our most distinctive shortcoming is that it was not written at a time when James Russell Lowell could have enjoyed it. His laugh would have acquitted us of the total lack of discernment of which we are accused. Holmes, too, we venture to think, might have been capable of pointing out in this German article places deserving of a smile. Then there was Irving. The creator of Wouter Van Twiller and Ichabod would not have been nonplussed by the outpourings of a kindred soul, or driven into a display of blind arrogance which seems to have befallen a generation that goes on believing it is amused at the follies of its predecessors. What Mark Twain would have said can only be conjectured, but it is certain that he could have given an excellent imitation of satirical appreciation. Mr. Dooley writes and sells to shrewd publishers matter that, once really understood by his satire-hating countrymen, would brand him as a criminal and a traitor. And there are hosts of paragraphers and cartoonists who risk their lives daily by poking fun at our most cher-

lished institutions and public men, and who are saved from the consequences of their work only by the obtuseness of those who pay for the privilege of seeing it. As our genial critic, however, is a satirist himself, able to penetrate beneath the surface, and as he has spent twenty years in looking at Uncle Sam under the microscope, he must be aware of all these concealed satirists. Possibly, therefore, his complaint of our dearth of satire is only ironical.

If, nevertheless, we misinterpret him, there are those to whom he can go even in this satire-loathing republic and who can tell him of what probably seems to them a tolerably effective substitute for an uncomplimentary mirror. If he will ask certain men the significance of the phrase "The Senator from Havemeyer" or "The Senator from Ryan"; if he will take the trouble to interview a retiring Speaker upon the unconstitutionality of making light of anything American; if he will seek out some Fifth Avenue belle, who has had the temerity to marry a lord, and get her opinion of the absence of gibes directed at American customs, he may discover that "dollar-worship" at least is conducted in this country amid a chorus which, if seldom seriously disturbing to the worshippers, would at all events preclude them from inquiring why we have no satirists.

ANTONIO FOGAZZARO.

I.

That the news of the death of Antonio Fogazzaro at Vicenza, on March 7, should have been reported throughout the world, wherever telegraphs and cables penetrate, is a tribute to the character of the man. For it was not Fogazzaro, the poet, nor Fogazzaro, the novelist, but Fogazzaro, the devout religionist who had dared to speak out, that for five years past has been known in both hemispheres. Probably, the immense vogue that came on the publication of "The Saint" was a surprise to him; for he had written novels which surpass "The Saint" as examples of sustained art; and he and his friends had for years been uttering openly and unreproved the doctrines which, when printed in "The Saint," called forth the condemnation of the Roman Catholic censors. Perhaps, therefore, we are inexact in pointing to his courage first, because he evidently wrote without foreseeing the ordeal through which he must pass. And yet it took real courage for a Roman Catholic, whether he had the menace of the *Index* in view or not, to state so truthfully, so sympathetically, and, as every one must feel, so poignantly, the distress of heart and of conscience by which many of his co-religionists were (and are) tormented.

Fogazzaro was primarily a poet, although his actual accomplishment in verse falls far below his achievement in fiction. His poems have grace, sweetness, purity of ideals, sensitiveness to nature, and that somewhat resigned attitude toward the tragedy of life that bespeaks a meditative, or at least, an un-Promethean character. But in his novels we find that he possesses not only a remarkable perception of the tragic and a great aptitude for embodying it in his personages, but also much humor of the deeper, quiet sort, and that he sees life vividly on all its levels. Thanks to his original poetic endowment, he sheds over his prose descriptions a glow and charm that lift whatever he touches out of the commonplace. Emotion, like the light that never was on sea or land, illumines his pages. Very often you cannot quite define it; you can only say that it must be there, because you feel it and are moved. Even what may be called the theological passages of "The Saint," quiver with emotion, as any one who reads them in Italian can verify. Compare them with similar passages in "Robert Elsmere," and you will see that while Fogazzaro vitalizes even dogma with emotion, Mrs. Ward remains intellectual. It is not merely the difference between Subiaco and Cumberland; but between genius which is essentially poetic and talents which, though of a high order, are essentially prosaic.

II.

Fogazzaro possessed the first qualifications of a writer of national significance: he was a patriot to the core in an era when patriotism was the great redemptive force in the life of his people. To the Italians of his youth, the spirit of nationality was more than religion; or, say, rather, that it included their religion. It taught them the duty of dying for their country—and no religion can do more than fortify its votaries to face joyfully the supreme test of giving up their lives to an ideal.

Born at Vicenza on March 25, 1842, Fogazzaro passed his early years under that Austrian domination which made rebels of all self-respecting Lombards and Venetians. Then he sought liberty in Piedmont, the ark of Italy's hopes, and witnessed there the swift drama of unification which began with the war of 1859. Subsequently, when Italy was one and his home free, he returned to Vicenza, where for a generation he held an honored position as citizen, poet, and man-of-letters, not unlike that which Longfellow filled at Cambridge during the last thirty years of his life. For a long time a talent for music and a talent for poetry developed in him side by side. Poetry finally triumphed, and until he was about thirty-five he put forth small volumes of verse, which gradually gave him reputation among the discerning.

In 1881 he opened his career as novelist with a story called "Malombra." Then, at leisurely intervals, followed "Il Mistero del Poeta," "Piccolo Mondo Antico," "Piccolo Mondo Moderno," "Il Santo," and, in the autumn of 1910, "Leila." Six not long novels in thirty years testify to Fogazzaro's deliberateness not less than to his intellectual conscience. His writings were a part of himself: not the products of a restless brain and notoriety-seeking literary ambition, but of a large and sympathetic nature, which absorbed facts and experiences, brooded over them, matured them, and finally gave them forth with the imprint of *inevitableness* upon them. What a contrast between him and the popular British novelists of the day, who turn out half a dozen volumes a year! But, possibly, not one of their many books will still be read, as "Daniele Cortis" is read, a quarter of a century after publication. In his restraint Fogazzaro runs counter to that journalistic speed-mania which has recently invaded literature.

Among the Italian novelists of his era, he seems to be the least influenced by foreign models: certainly, he was the least affected by the French, whose initiative has too often checked originality in the drama and fiction of modern Italy. Critics who pin their trust to literary labels would classify him as a Realist; and he has hardly been surpassed in the minute faithfulness of his descriptions of the outside world: but he never over-emphasizes these details, never for a moment wishes you to suppose that they are paramount, or that he prides himself, as the Simon-pure Realist usually does, on having competed with the microscope and the kodak and beaten them at their own game. In his realism he resembles rather George Eliot in her "Scenes of Clerical Life"; like her, he keeps ever before you the truth, that the external world which he paints with such loving accuracy is only the stage on which human passion plays its part. That is his real theme—human passion.

I have discussed elsewhere some aspects of Fogazzaro's literary genius, and particularly of "The Saint," so that I need not go over that ground again. He touches, as every novelist or poet who deserves to be called great must touch, the ultimate deeps of human nature. In his art, he lacks that final symmetry, the *nothing-too-much* of the Hellenic ideal, which Turgenieff alone among Fogazzaro's older contemporaries seems to have attained. He requires usually several chapters in order to bring his story into action; but when once introduced, it moves on with assured ease.

III.

Posterity will assign him to an honorable station in Italian literature. His countrymen already place him alongside of Manzoni, debating whether his "Daniele Cortis" or his "Piccolo Mondo Antico" (known in English as "The Patriot") is his greatest book. But what made him a world-celebrity was "The Saint," and that not from the standpoint of fiction, but from the standpoint of religion. In its sphere it had an influence comparable to that of "Uncle Tom's Cabin," which millions read sixty years ago, not as literature, but as a moral document. So "The Saint" was immediately seen to be the symptom of a widespread movement among the most enlightened Roman Catholics the world over. It brought to the surface the acknowledgment of a change which any one familiar with actual conditions knew had been taking place for several decades.

In brief, the evolutionary view of man's development had come to be accepted, more or less hopefully, by Catholic as well as by Protestant theologians, and they might have been allowed to go on much longer undisturbed, had not Fogazzaro succeeded by his genius in embodying the question in the lives of the persons of his novel—persons whom he made so real that they and the opinions they embodied entered into myriads of households. Fogazzaro himself seems never quite to have understood how the implications of evolution must affect a church based on supernaturalism; at least, he himself never accepted those implications, and hardly realized to what extent they might act as a solvent. If you begin to study the Papacy or the Roman Church as an institution having an historical development, you will soon reach facts that traverse any claim to immutability: you will come upon those "excrescences" and "ossified organisms" and "perversions" which Fogazzaro described, not as an enemy or iconoclast, but with such tender solicitude as a young physician might show in diagnosing a chronic disease which had laid hold of his mother. Unquestionably, much of Fogazzaro's power comes from his not being, in any narrow sense, polemical.

The Roman censors, however, having long before decided that the evolutionary theory undermined their dogma, now put "The Saint" on the *Index Expurgatorius*, and made a formal demand on Fogazzaro to retract, which he formally obeyed. For a year or more he was placed in an ambiguous position which would have tried any man of honor, above all, a man as sensitive to henor as he. The Blacks exulted in having forced him to recant his heresies; the Liberals, not only in Italy, but all the world over, felt disappointed or disgusted because they imagined that he had pusillanimously deserted his cause out of fear of Clerical persecution. In fact, however, both sides did him injustice: he was neither the heretic the Blacks painted him, nor the new Luther the Liberals expected him to be. He regarded his criticism of Papal and ecclesiastical abuses as not impugning, much less invalidating, the fundamental truths of his church. So, in his latter days, Carl Schurz would have been astonished if his criticism of Tammany Hall or of Bryanism had been taken as an arraignment of the fundamental principles of Democracy.

It happened that I saw Fogazzaro at his beautiful home on the hill above Vicenza—what poet had ever a more inspiring abode?—in the autumn of 1906, just at the time when he was entangled in this double misunderstanding. I gave him a message from an eminent man-of-letters in Turin, who said to me, "Tell Fogazzaro to come out of the church and lead a schism. There is not the least hope that the Vatican can ever be reformed from within." "But I cannot quit the church," Fogazzaro replied, with simple, impressive earnestness. "I am a believing Catholic. As to my so-called recantation, the censors informed me that 'The Saint' contained matter contrary to dogma, and I answered that, although unaware of what it was, I withdrew it. Had they specified one point or another—which they took care not to do—I should have had to examine it with my conscience, and if my conscience had approved I should have stood by it."

"As for leading a schism," he went on, "that would be bad strategy, even if I were not a sincere believer and no schismatic. It is only by staying in the church that one can hope to reform it. When a man leaves it, his criticism has no more weight with the shapers of its policy. They merely say, 'He is a Protestant or an atheist, and of course he will calumniate us.'"

I condense into a few sentences the gist of a long conversation. So little did Fogazzaro believe that he had either assailed fundamental Catholicism or recanted, that that winter he gave an address in Paris in which, as he assured me, he reaffirmed his position; and he was one of the promoters of a Liberal-Catholic journal, which, however, soon gave up publication. For the Vatican, having begun the work of discipline, did it thoroughly. More logical than Fogazzaro, it smote Modernism root and branch, and went on to issue the Syllabus, which denounced modern liberty in all its forms. It drove out Father Tyrrell, who, as Fogazzaro said to me, had the most splendid intellect among the reformers; it drove out Abbé Loisy, one of the foremost Catholic scholars of France. They could not, like Fogazzaro, stop short of taking the final step. They saw that Modernism was only a halting-place, not the goal.

The great body of Italians imputed his retraction to lack of courage. Some of them branded it as a defection. So, it will be recalled, Liberals suspected Edmund Burke of defection because, having defended liberty in the American colonies, he denounced its later manifestation in France. The mistakes, in the case of both men, came from misunderstanding. Some of the hotheads clamored for Fogazzaro to resign from the Italian Senate; because, they said, a man who had sworn allegiance to a foreign sovereign, the Pope, could not be trusted to legislate for Italy. But Fogazzaro was as patriotic an Italian as any that breathed. He no more dreamed of restoring the Temporal Power in Rome, than Archbishop Farley dreams of restoring the sovereignty of the King of England in New York. Only a very small minority of Curialized Italians keep alive the question of the Temporal Power. Devout Catholics, like Fogazzaro, unite with all other patriotic Italians in love of country. The suspicion of disloyalty which a few extremists brought against him had no justification, and has never been revived.

It would require an artist as sympathetic and penetrating and fair as Fogazzaro himself to describe the vicissitudes of his later years. He has come through them with honor unscathed. Whoever knew him will never forget his personal charm, nor his serenity, nor the perfect blending in him of the poet and the highest type of man-of-the-world. He produced novels of rare merit; and it was his good fortune to be the mouthpiece of one of the vital moral crises of his church. The time may come, after the present Jesuit reaction has passed, when the successors of the ecclesiastics who censured him may recognize that he endeavored, with more genius than any other Catholic of his generation, to discover the way to harmony between heart and head, reason and emotion, for which not Catholics only, but Christians of all creeds, have yearned.

William Roscoe Thayer.

NEW YORK PUBLIC LIBRARY REPORT FOR 1910.

No attempt is made by the compiler of this report to produce a sensation, or, indeed, to interpret the facts presented, but the facts themselves are so striking, the figures so impressive, that they can hardly fail to compel wide consideration.

Briefly tabulated, the more important statistics are as follows:

	1909.	1910.
No. of branches in system..	42	42
No. vols. in library system.	1,549,260	1,619,228
No. vols. added	220,520	177,533
No. vols. in Circulating Department	755,406	809,350
No. vols. loaned for home use	7,013,649	7,506,976
Readers supplied in reading or reference rooms	1,351,649	1,665,456
No. of active borrowers	291,616	312,221
No. vols. of non-fiction circulated	3,071,728	3,461,097
No. vols. borrowed by children	2,468,383	2,645,708

Total expense of operating library system	$885,698	$872,835
Expense of Circulating Department	$674,735	$656,685
No. persons on library staff.	659	732
Average cost per volume of circulation	$.096	$.087
Average cost of library per unit of population	.23	.21

The leading branch in respect to circulation, number of borrowers, and attendance at reading rooms is the Seward Park in East Broadway, which, with a stock of but 28,381 volumes, issued a total of 424,647 volumes for home reading and supplied 139,703 readers in the reading rooms. Outside of Greater New York there is no library system in the State, save that of Buffalo, that has any such record of use as this single branch, and no other branch in the United States, or, probably in the world, can equal it. Its nearest competitor is the Brownsville branch of the Brooklyn Public Library, which last year held first place in the greater city, but which this year is 54,377 volumes behind the Seward Park branch. There are eleven other branches in the New York system, which show a circulation of above 200,000 each. Those with the largest recorded use are nearly all on the East Side of the city, where the foreign-born and the tenement-house population is thickest, indicating the great popularity of the library with this part of the community. A study of the statistics shows, further, that it is just this part of the population which is making most use of the library for study and the reading of scientific, historic, sociologic, and philosophical books.

Great as the total use of the library is, statistics of registration show that not quite 11 per cent. of the population of the city are enrolled as borrowers, indicating how vast an expansion is still possible and feasible. The lines along which this expansion is to take place are indicated in the special report on work with children. More than one-third of the total circulation last year was from children's rooms, and of the 123,313 new borrowers registered, 65,674, or more than one-half were children, and of the 145,599 volumes added to the branch libraries, 65,835, or nearly one-half were for children. Strong as the children's collection has become, the report says that in many departments, particularly in American history, civics, biography, fairy and folk stories, it is entirely inadequate to meet the ever-growing demand. Titles mentioned which it is impossible to duplicate enough are the "Old Testament," Grimm's "Fairy Tales," "Little Women," "Heidi," "Pinochio," Hill's "Fighting a Fire," and the American histories of Fiske, Gordy, and Montgomery.

Of particular interest to students of library economy are the reports of the book-buying and binding departments. The average cost for all the books bought during the year was 90 cents a volume. Popular books for which there is sure to be a large circulation, are bought in sheets, and bound by a special process to insure the longest possible wear. The average cost of books supplied in this binding, of which there were 31,000 volumes, was $1.19. The number of books worn out during the year was 78,878, which means that one book is worn out and discarded on an average for every 100 issues. Twenty-two thousand two hundred and forty-four of the volumes discarded from the regular shelves were put to a good final use by being sent to prisons, hospitals, and other places from which books cannot be returned.

How difficult it is for a great circulating library to add to its variety of titles and to build up a broad general book collection is shown by the fact that in the stock of 137,149 new volumes added in 1910, there were only 6,105 new titles, and in the whole collection of 737,560 volumes in English in the circulating system, there are only 72,744 different works. Of these, fiction constitutes 23 per cent., general literature 12 per cent., biography 9½ per cent., sociology 8 per cent., fine arts 8 per cent., religion 7 per cent., travel 7 per cent., science 6½ per cent., useful arts 6½ per cent., history 6 per cent., philology 2½ per cent., philosophy 2½ per cent., general works 1½ per cent. Libraries desiring a guide as to the proportions that should obtain in building up their collections will find these percentages well worth considering, as they represent the widest and most thoroughgoing experiment ever yet made in the effort "to bring to all the people the books that belong to them."

Correspondence

IS SHAKESPEARE RESPONSIBLE FOR JOHN HARVARD?

To the Editor of The Nation:

Sir: The discoveries of Prof. C. W. Wallace of the University of Nebraska, relating to the life of Shakespeare in London, and including a new autograph signature of the poet, were given to the world more than a year ago, and, so far as I am aware, are not questioned. The revelations have a bearing upon the relation of Shakespeare to John Harvard; and since this as yet appears to have been nowhere considered, it is worth while to set it forth.

Mr. Henry F. Waters has established by a masterpiece of antiquarian research that John Harvard's mother, Katharine Rogers, was born in Stratford-on-Avon, whence, in 1605, having married Robert Harvard, she came to London. The identification of the "old house in High Street" as her early home is complete. The house is now the property of Harvard University, having been restored carefully to its original condition, and dedicated as "Harvard House" with elaborate ceremonies, in which the American ambassador and dignitaries of the English universities took part. To summarize what we certainly know as to a connection between the Shakespeare and Rogers families: Throughout the reign of Elizabeth, John Shakespeare and Thomas Rogers lived in Stratford, side by side, men of about the same age, in the same occupation and station in life, Aldermen together in the little borough of not more than two thousand souls, each in turn bailiff or Mayor. They married not far apart, were in the same parish of Holy Trinity, whose register holds, side by side, the records of the births, weddings, and deaths in the two households. Children came numerously to both families, and the register shows that for each Shakespeare there was a Rogers mate. The boys went together to the old Edward VIth grammar-school, playing between times on the village-green and the Avon banks. William and Charles were respectively the eldest sons in the two families, and William Shakespeare, after an irregular youth, went, when twenty, to London to seek his fortune. That families so circumstanced should have mingled intimately was inevitable.

Katharine, one of the younger children of the Rogers home, was born in 1584, about the time when William Shakespeare went forth to the world, and in 1605 married the Londoner Robert Harvard, a market-man in Southwark. What brought the London tradesman and the Warwickshire maid together? A hundred miles stretch between London and Stratford, not easily traversed in those days by the plain people. For the most part the roads were ill-kept horse paths, only here and there practicable for vehicles, which then were rare indeed. For the Stratford region the easy outlet to the world was by the Avon to the Severn, where lay Bristol. Merchandise went back and forth only with difficulty between London and the western midlands. For the most part Stratford traders looked westward and Southwark traders southward in their enterprises, a bar separating the two not readily passed until the intercommunication of later times came about. In his narrow round there was nothing to call Robert Harvard to remote Stratford; as, on the other hand, there was little reason why the busy Warwickshire yeoman should be concerned with the toilsome journey to and from London. The more one ponders the matter the more one thinks there must have been an intermediary, some one knowing both Stratford and Southwark, knowing both Robert Harvard and Katharine Rogers, with a good-natured willingness to make other people happy, who here stepped in. Such a character there was, William Shakespeare. In twenty years, after going to London, he had been successful as a theatrical manager, acquiring money and fame in his Southwark playhouse, hard by Robert Harvard's shop. He cherished always a love for his birthplace, and as soon as his means allowed bought New Place in Stratford, going back and forth between town and village. In each locality he was a citizen, withdrawing at last gradually from his London connection, while entering fully as a burgess into the life of the community on the Avon, and taking part in its affairs. Inevitably he must have been interested in the handsome house of Thomas Rogers, the finest in the High Street, completed in 1596, for in the years immediately succeeding he was himself building and improving at New Place. It is natural to suppose, unnatural not to suppose, that he often studied the elaborately carved front, and passed in and out over the threshold, and was cognizant of Katharine, just then maturing into the comely and attractive woman it is certain she became. The case is well stated in the "John Harvard" of Henry C. Shelley. To make the match there must have been an intermediary; the conditions for such a going between are completely filled in William Shakespeare, and no sign exists that there was any other man or woman who could possibly have played the part.

Would Shakespeare's disposition naturally have led him to do such a thing? Here at last we reach the point where the discoveries of Professor Wallace have a bearing. He makes clear that for a number of years Shakespeare lodged north of the Thames in London, with Mountjoy, a French wig-maker, living on intimate and

gonial terms with his humblo entertainers, tho household containing, besides the father and mother, a daughter, Mary, and a capablo and industrious apprentice, Stephen Bellott. Stephen and Mary in 1604 became man and wife, and in making the match Shakespeare took an important part. He had the confidence of the parents, who advised with him, and sent him to talk with the young people. Stephen and Mary, too, trusted to and were influenced by him. In later years came trouble. Stephen, believing that a dower promised had been withheld, and that he had otherwise been ill-treated, went to law, prosecuting his father-in-law for his shortcoming. In the suit, Shakespeare appears as the most important witness. His signed deposition, with other papers in the case, has been preserved in the dust-heaps, and has now been brought to light by Professor Wallace (see *Harper's Magazine*, March, 1910).

The revelation is most interesting as showing that Shakespeare, when he was doing his supreme work, at the same moment, as a man among men, had a heart for the welfare of his every-day associates. What he did for Stephen and Mary, he might just as easily and naturally do for Robert and Katharine. The incident in London, apparently well established, adds weight to the likelihood that Shakespeare had a hand also in Robert Harvard's wooing, which was almost contemporaneous.

We have, however, only circumstantial evidence. It is tantalizing to be so near and yet so far. Had the Harvards and Rogerses only been a bit quarrelsome, and, like the Bellotts and Mountjoys, have got into the courts! With joy, we fear, should we discover that the Southwark and Stratford families were not always good-natured and harmonious; but that there was a feud, for in the dust-heaps Professor Wallace might discover a scrap of court record that would at once transmute for us all this likelihood into certainty. Did the magician, in the very hours when he was giving to the airy nothings of the chroniclers habitation and name as Hamlet or Othello or King Lear, lie thus strangely behind the pale, pious scholar, "enlarged toward his country and the good of it, in life and in death," who set aflame in the Western Hemisphere the torch of liberal culture? JAMES K. HOSMER.

New Westminster, B. C., February 28.

AN ANCIENT MODEL FOR "CHANTECLER."

To the Editor of The Nation:

Sir: Apropos of beast fables, feathered dialogue, and the like on the stage, there is an account in Sir Bulstrode Whitelocke's "Memorials," under date 1633, of one of the most extraordinary performances ever witnessed in England. It is well known that one of the chief causes of Prynne's imprisonment, degradation, and legendary earboring and nose-slitting, was the offence which the King and Queen took at reflections made on actresses in "Histriomastix," the Queen herself being very fond of taking part in masques. As a chastisement to Prynne for his denunciation of actresses, and as a mark of respect to Charles I and his Queen, the members of the four Societies of the Inns of Court devised one of the most (if not the most) elaborate and successful royal masques ever presented. The cost of the music alone for the occasion was £1,000, while the entire expense exceeded £120,000 sterling, which, measured by present-day standards, would exceed the half-million figure.

The masque was given on Candlemas day, in the evening, 1633. The marchers, dancers, masquers, and anti-masquers started from Ely House in Holborn and proceeded down Chancery Lane to Whitehall. Among this numerous procession was an anti-masque of beggars and cripples. After these (following now the words of the chronicler) came Men on Horseback playing upon Pipes, Whistles, and Instruments sounding Notes like those of Birds of all sorts, and in excellent Consort, and were followed by the Antimasque of Birds: This was an Owl in an Ivy-bush, with many several sorts of other Birds, in a clustre about the Owl, gazing as it were upon her: These were little Boys put into covers of the shapes of those Birds, rarely fitted, and sitting on small Horses, with Footmen going by them, with Torches in their Hands; and here were some besides to look unto the Children, and this was very pleasant to the Beholders. . . . The King and Queen stood at a window [in Whitehall] looking straightforward into the Street, to see the Masque come; and being delighted with the noble Bravery of it, they sent to the Marshal to desire that the whole Show might fetch a turn about the *Tilt-Yard*, that their Majesties might have a double view of them.

The performance consumed the entire night, and it might be supposed that, gorgeous as the spectacle must have been, their Majesties had been surfeited. But not so:

The Queen who was much delighted with these Solemnities, was so taken with this Show and Masque, that she desired to see it acted over again: whereupon an Intimation being given to the Lord Mayor of *London*, he invited the King and Queen, and the Inns of Court Masquers to the City . . and the same Masque was again presented to them. . . . This also gave great contentment to their Majesties, and no less to the Citizens, especially to those of the younger sort, and of the Female Sex.

WATSON NICHOLSON.

London, February 18.

RIGHT AND LEFT AMONG ROMANS AND CHRISTIANS.

To the Editor of The Nation:

Sir: One of my earliest archæological reminiscences is a heated controversy as to whether the early Church considered Peter or Paul the greatest of the apostles, as indicated by their position on the right or the left hand of the figure of Christ in works of art. I fancy it was the English Protestant archæologist Parker who, more than thirty years ago, stoutly maintained that the many early works of art where St. Paul appeared at Christ's right hand proved his spiritual, if not his temporal, superiority—a theory welcomed by other Protestants and vigorously scorned by Catholic writers. Much dust was raised, but the puzzle remained unsolved. While no unprejudiced person could doubt the supreme position given to St. Peter by the Church, it was also impossible to deny that St. Paul was most frequently placed at the right hand of Christ. Bearing in mind the parable of the sheep and the goats, Mr. Parker's inference seemed logical.

Of course, there was some simple explanation, and a moment's reflection ought to have suggested that it was to be sought in ideas and customs far antedating the foundation of Christianity; for such associations are formed in the dawn of a race's history. It was while studying Etruscan and Roman augural ceremonial that the explanation of the long-forgotten puzzle casually came to me. Some weeks later I happened on a recent number of the Johns Hopkins *Notes from Classical Seminaries* (1910), with the summary of an interesting thesis by Mr. Wagener on "Popular Associations of Right and Left in Roman Literature." He notes the well-known and curious anomaly, already familiar to me, that, while in ordinary matters the left hand had with the Romans the usual sinister or unfavorable aspect, there was one important exception. In all matters connected with augury—that is, with the relations between the gods and men—the man's left was the favorable, and his right the sinister side. In other words, all signs and portents appearing on the left were auspicious. Mr. Wagener may have given the explanation of this apparent contradiction in his essay, but the summary appears to show that it escaped him. I believe, however, that it is quite simple, and that the same answer to this puzzle will solve the Peter-Paul mystery.

A comparison of Roman with Greek custom will show that the Greeks did not make any distinction between mundane and super-mundane luck. With them the right side was the fortunate side in augural as well as ordinary circumstances. Now this difference was not fortuitous; it was due to a difference of orientation, by which what was on the right of the Greeks during an augural ceremonial was on the left of the Etruscans and Romans, and *vice versa*. On these occasions the Greek faced the north, and therefore had the east on his right. With all ancient peoples, even those whose relation to sun-worship was not close, the east was considered the source of all good things; hence the association of the right and of good-fortune was obvious.

But with the Etruscans, the augur faced toward the south, instead of the north, and, therefore had the east on his left instead of his right hand, so that in their minds the good gifts from the gods were associated with the left hand. The Romans were absolutely dependent on the Etruscans in celestial augury and adopted the Etruscan theory in this connection, while following the same ideas as the Greeks in all extra-augural associations.

How does this difference between the Greek and the Roman points of view affect the Peter-Paul controversy? Now, suppose it should be found that the same old opposition as to augural position between Greeks and Romans showed itself in the position assigned to the Apostle Peter: that among the Greeks he was placed on the right and among the Romans he stood on the left, is not the conclusion obvious? As a matter of fact, it is several years since I noticed this peculiarity without then understanding its cause. In certain reliefs, mosaics and frescoes of obviously Roman character, Peter appears on the left; in others of equally certain Byzantine or Greek character, he is on the right. We should have expected just the reverse by ordinary standards, because western artists would naturally emphasize Peter's supremacy. But, as soon as we reflect that

such religious scenes as that of Christ and the Apostles representing the Church Triumphant concern the relations between God and man, in the same way as did the augural ceremonial, we can see how Roman artists would use in these religious scenes that connection between good fortune and the left side with which they had always been familiar. Therefore both Roman artists and Byzantine artists acknowledged Peter's supremacy, and gave him what each considered the superior position. The divergence is, then, one of appearance, not of substance. Peter triumphs in each case. I trust my Catholic friends will rejoice and not distrust a Protestant, even "bringing gifts."

As a corollary, I would apply this as a test in the case of many important works of mediæval art in Italy about which there is much dispute whether they are Byzantine or western art: for example, the cycle of frescoes in S. Angelo-in-Formis. Where style seems so inconclusive, let us see whether Peter (if he is there) stands on right or left, and let this settle the question! All of this shows that to be a good archæologist, one must know religion and history, as well as technique and style.

A. L. FROTHINGHAM.

New York, March 9.

A POETICAL GENEALOGY.

TO THE EDITOR OF THE NATION:

SIR: It is interesting, at a time when literary tradition is set at naught, to see how much a poem like Kipling's "Recessional," perhaps the best-known poem written in English within the past few years, owes to literary tradition.

Of course, its chief debt is to the Bible; it is full of Scriptural phrase. It owes something also to familiar hymns, such as Watts's "O God, our help in ages past." A friend recently called my attention to the resemblance in thought between the first two lines of the second stanza:

> The tumult and the shouting dies,
> The captains and the kings depart,

and some lines in Lowell's "Commemoration Ode":

> Great captains with their guns and drums
> Disturb our judgment for the hour,
> But at last silence comes:
> These all are gone.

I recently noticed that another line in the poem,

> Dominion over palm and pine,

seems to have been borrowed from Emerson's "Woodnotes":

> And grant to dwellers with the pine
> Dominion o'er the palm and vine.

If we add these lines to the ones showing the influence of Scripture or hymns, there will remain barely three or four lines in the poem unaccounted for; and it would be rash to say that even these owe nothing to tradition.

Of course this detracts nothing from the originality of the "Recessional"; for whatever "originality" may mean in literature, it does not mean independence of literary origins.

HOMER E. WOODBRIDGE.

Colorado Springs, Col., March 5.

HOW TO SPELL TOLSTOY.

TO THE EDITOR OF THE NATION:

SIR: I do not blame Mr. N. H. Dole for standing up for the spelling of Tolstoy's name adopted in the edition with which he (Mr. Dole) is connected; but he does not succeed in showing that Tolstoy did not know how to spell his own name.

The American Library Association adopted, as Mr. Dole says, a "careful and perfectly sensible system of transliteration," but it was framed merely for their own purpose of cataloguing books. It is a system as good as the systems adopted by various other associations, but it has no special authority, and it is not generally accepted for—or, in my opinion, well adapted to—literary use.

Mr. Dole's mention of the fact that Russians pronounce the *o* (and indeed the vowels generally) broader than we do, is correct, but quite beside the mark; for the *o* in Tolstoy remains the same whether the last letter is *y* or *i*; and the ordinary English speaker seldom gets nearer to the correct sound than he does when he uses the word *toy* accentuated.

Not only did Tolstoy spell his name with a *y*, but his family do the same, and his friends and acquaintances also. It is the natural and best way of spelling it, and the way least likely to puzzle the reader. Mrs. Constance Garnett spells it so in her translations, and such publishers as Constable and Heinemann in London and Dodd, Mead & Co. and Funk & Wagnalls in New York do so in their editions.

It is, I agree, not a matter of much moment whether we spell Tolstoy's name right or wrong—but as Mr. Dole has written a long letter about it, I may be excused for writing a short one to point out that there are two ways of spelling it: Mr. Dole's way and Tolstoy's way; and which Tolstoy's way was, you may see by the reproduction of his autograph (Leo Tolstoy), which I enclose herewith.

AYLMER MAUDE.

London, March 2.

Literature

THE LIFE OF CECIL RHODES.

The Life and Times of the Rt. Honorable Cecil John Rhodes, 1853-1902. By the Honorable Sir Lewis Michell, Member of the Executive Council of Cape Colony. In two volumes. New York: Mitchell Kennerley. $7.50 net.

The extent of the British dominions in India and in those outlying colonies which border on barbarous or semi-civilized communities, as well as the various undefined interests Britain has had in divers parts of the world, has given to Englishmen opportunities for a career of adventure rare in other modern countries. Such opportunities appeal to bold spirits of the type which was common everywhere in the sixteenth century, but is now becoming almost extinct in Europe for lack of a free sphere of action. Clive was the earliest of these adventurous spirits. Cecil Rhodes has been the latest; and there does not seem to be now much room left for others. Careers of this kind are, of course, less romantic, under nineteenth century conditions, than they were in the days of Cortes, or Raleigh, or Champlain. But the qualities of mind and will that make the successful adventurer remain always the same, and he who observes them as seen in a contemporary figure can get nearer to comprehending them in the men of the past, about whose personalities less is known.

Cecil Rhodes died in 1902. There are advantages in having his life written while public interest remains fresh and eager. There are also disadvantages in writing it while the friendships and antagonisms which a chequered and combative career has roused remain strong. Smouldering fires may be kindled, yet if the biographer is sedulous to keep his steps off the hot ashes, he may fail to tell truths that need to be told, and the historical value of his work may suffer.

This book incurs both these dangers. Not all, perhaps not nearly all of the truth is told about the later events it describes, the Jameson Raid and the War of 1899; while, at the same time, reflections (not always necessary as part of the story) are made upon some of the statesmen who were the colleagues or opponents of Rhodes in South African politics, reflections which cannot be pleasant to those who survive or to the relatives of those who have departed. The author, Sir Lewis Michell, is known as a man of ability and of social importance in Cape Colony. He was an intimate friend of Rhodes in his later years, and was named an executor of the latter's will. He writes with a knowledge of South African conditions and men which is indispensable for the task he has undertaken. His book purports to be not only a biography, but also a view of the whole time covered by the career of Rhodes, whereas Sir T. Fuller's book, a useful and fair-minded work, entitled "A Personal Study of Cecil Rhodes" (reviewed in the *Nation* on August 25 last), does not pretend to be even a systematic biography, but only a contribution to a comprehension of the position and character of Rhodes. We must, therefore, apply a somewhat more exacting standard to Sir Louis Michell than to his predecessor, for he sets out by promising us more.

His book may be examined in three aspects. It is a record of the words and acts of one man, its subject. It is a study of that man's character as a person who made a great impression on his contemporaries. It is a general view of the events and the men of a time which was specially critical and fateful for South Africa, a country that has had a great deal of history in the last hundred years.

Of these three objects, the first, being the simplest, has been much more fully attained than have the other two. Sir L. Michell has had access to the papers which Rhodes left, and knows at first hand many of the events he has to chronicle. He gives a straightforward and fairly clear account of those events, and evidently wishes to be impartial. It is not a lively or dramatic narrative, and as Rhodes wrote very few letters and never kept a diary, it is a narrative based on public records rather than on any previously undisclosed sources. The data for the boyhood and youth of Rhodes are scanty and the interest of such data as have been preserved is slight, but after he had entered the Cape Parliament materials became more abundant. Thus we have a pretty good record of his action and of the views which governed it. A brief summary drawn from the book may precede what is to be said here regarding his career and character as a whole.

Sprung from a respectable middle class family, which seems to have been settled in Staffordshire in the latter half of the seventeenth century, Rhodes was born in 1853, at the little town of Bishop's Stortford, in Hertfordshire, where his father, a man of ability, and, as some people thought, slightly eccentric, was vicar of the parish. The son was educated at the local grammar school, and does not seem to have shown, in his earlier days, any sign of exceptional talent. The delicate state of his lungs caused him to be sent out to Natal to join an elder brother who was farming there, and when diamonds were discovered at the place now called Kimberley, the youth, then only eighteen, left the farm where he had begun to grow cotton, and went to seek his fortune in the crowd of diggers. The first sign of superior powers which he gave, was his determination to obtain for himself an Oxford education. He went home to England in 1873, matriculated at Oriel College, to which he afterwards left a large endowment, and stuck to his college course during the next six or seven years, living at Oxford during the warmer months, and going out to South Africa to look after his business interests there in the winter. In 1880 he entered the Cape Parliament and soon made his mark, not by oratory, for he was never a polished or graceful speaker, but by the force of his views, and the independence of his attitude. The Assembly was a small body, and a man of capacity could quickly acquire influence. Within four years he was appointed to a ministerial post, and thenceforth divided his time between his Parliamentary duties at Cape Town and the great scheme he had on hand for consolidating the interests of the numerous claim-owners at the Kimberley Diamond Mines. This he finally accomplished in 1889, and by it established his financial position as the master of a huge fortune. In 1890 he became Prime Minister of Cape Colony, won the confidence of the Dutch party, and exercised a greater power there the next five years than any of his predecessors had held. That power was all the greater, because, in 1889, he had performed the second chief feat of his life in obtaining a royal charter for the British South Africa Company. This charter became, in the sequel, the means of establishing the sovereignty of the British Crown over the vast territory which lies north of the Transvaal, up to and beyond the Zambesi River. As head of that company, he controlled, and exerted himself to develop, a region bigger than Cape Colony itself. This double position had an element of danger in it, and was the cause of his fall from office. In December, 1895, Dr. Jameson, the administrator of the company in Matabeleland, led an armed force into the Transvaal, and Rhodes's connection with the Raid, as it was called, compelled his resignation of office, although Jameson had started at a time and under circumstances not contemplated by Rhodes himself. This was the end of his official life, though he remained a great figure in South Africa, and would probably have returned to power, had he not succumbed to illness in 1902. It would appear, from what Sir L. Michell says—and this is more explicitly stated in Sir T. Fuller's book already referred to—that Rhodes had nothing to do with the inception of the South African war of 1899, although Sir Lewis earlier emphasizes the fact that he frequently declared that the Transvaal President was "only bluffing" and would in the long run give way. This may have indirectly contributed to the outbreak of hostilities, but Rhodes, according to both our authorities, disclaimed any participation.

The story we have briefly summarized is told carefully and with sufficient fulness by Sir L. Michell. Particularly useful to those who desire to follow the story without wading through the interminable morasses of British Blue Books, will be the narrative of the long and complicated game which Rhodes played against the Transvaal Boers, in keeping them back from spreading into those native territories to the North, which were ultimately procured for the British South African Company. Rhodes's vigor and pertinacity show to advantage in this long struggle. On the other hand, the tale of the Jameson Raid is very imperfectly told. Whoever wants to understand that singular episode and the consequences it entailed, up to and including the war of 1899, will find little illumination in these pages.

As an account of "the times of Cecil Rhodes," the second aim to which Sir Lewis has directed his efforts, the book is quite unsatisfactory, for no attempt is made to present a general view of the state of South Africa as a whole, the questions which agitated it, the composition and ideas of the political parties. Some remarks are here and there made, mostly caustic remarks, on the characters and conduct of such men as Sir Gordon Sprigg, Mr. Merriman, Mr. Hofmeyr, Mr. Schreiner, and Rose Innes, but there is no adequate appreciation of any of these persons. If the author thought that the time had not yet arrived for such an appreciation, it might have been better to refrain from reflections, some of which may be wounding. Criticisms made in a book which looks forward to a long life are more resented than those that appear in newspapers and magazines destined to speedy oblivion.

Last of all we come to the character of Rhodes himself. The picture our author presents though not made vivid or impressive by any skill in portraiture, is free from the bias which personal friendship might be supposed likely to give. Weak points are frankly recognized, and strong points dwelt on with no more than that amount of enthusiasm which custom concedes to a biographer. We see a forceful, self-reliant nature, roughened by contact with a rough world, and not at all scrupulous about means, yet capable of large plans and fine conceptions, cherishing ideals which, if in a sense they were material, were neither sordid nor selfish. The most notable feature in his genius, because one rarely found even in eminent men, was the union in him of intense practicality with a curious dreaminess and absorption in his own fancies. This was remarked in him from the first. One who knew him well in youth wrote:

> I seem to see in memory a fair young man, frequently sunk in deep thoughts, his hands buried in his trousers pockets, his legs crossed and possibly twisted together, quite oblivious of the talk around him. The same qualities that were to go with him through life were discernible now. He was a compound of moody silence and impulsive action. He was hot and even violent at times, but in working towards his ends he laid his plans with care and circumspection. . . . The punctilious regard for minutiæ usual in business men was absent in his character; he was hopelessly untidy. Very simple in his tastes and wanting few things, he determined to trouble himself only about the most important. (Vol. I, p. 48, 9.)

The habit of brooding seems never to have left him. He used to ride out alone, and with so loose and careless a seat that his friends thought he would sooner or later have a bad fall. He revolved the same ideas incessantly, and would repeat them in the same words. He would sweep out of his way those who tried to bar it; but he gave no signs of malignity and scarcely any of vindictiveness. He was

naturally of a kindly nature and very susceptible to kindness shown to him.

We have spoken of him as the last of the great adventurers. But those old Spanish and English adventurers to whom it is natural to compare him rose by military or nautical talents. Rhodes, conformably to the conditions of our time, rose by financial capacity, boldness, persistence, skilful calculation. His huge fortune, acquired by the patient dexterity with which he worked out the consolidation of the diamond-mining properties, was the basis of his power, not that he used it in any corrupt way, but that it gave him influence and prestige in his colony, while enabling him to obtain the northern territories and start his great company. He was no money grubber, and neither valued wealth for its own sake nor spent it in luxurious living. To him it meant power, a means to his aim of extending British territory and making himself famous. Power he loved with that passion which those who feel their own strength have, and fame he sought with a kind of frank naïveté which reminded one of the ancient Greeks, and almost disarmed criticism. He was never married, and it would appear was never even drawn toward marriage by any feminine charms; had few friends and was faithful to them, liked poetry a little and history a great deal, yet only as they touched the subjects that occupied his own mind. Seldom was he either gay or witty; yet he could show on occasion a sort of grim humor. Altogether an interesting character, and one that deserves to be drawn in sharper lines and with more skill in the distribution of light and shadow than we find in this book.

CURRENT FICTION.

Adventures in Friendship. By David Grayson. New York: Doubleday, Page & Co.

Very likely it would not be the truth to say that only persons who actually live in the country, on a farm, are qualified to judge of Mr. Grayson's rural idylls. These idylls might be untrue to the fact and still carry their message (as the cant phrase runs) to those city-dwellers who, on spring nights, fancy themselves yearning for the real country. It might be interesting to speculate how far the modern story-teller is bound to address himself to an urban and suburban constituency, being careful either to undervalue the country (we mean not the country of "country life," rural architecture and blooded horses, formal gardens, and cottages with a score of bedrooms and half-score of bathrooms, but the country of the countryman), or to adorn it with such tints as made the Dresden shepherdess engaging to our great-grandfathers. Mr. Grayson does not grossly sentimentalize his subject; his country life is quite as near the fact as that of "The Deserted Village." But one is invited to inspect his rural scenes through a veil of rose-tinted gauze. It is all a little voluptuous, a trifle overdone, to the real country-dweller. It plays up too obviously to the homesick memories, or the inexperienced desires, of the denizen of the hall-bedroom, or of the bachelor maid's lodging house. It is not quite simple enough to interpret the simple life of actuality. But to the audience to which it is addressed, it is eminently fitted. It does for the inward eye what "The Old Homestead" and "Shore Acres" do for the inward ear—it gives the cherished illusion of rustic happiness.

> Dear lovely bowers of innocence and ease—

such are the bowers which Mr. Grayson inhabits, with his cheerful companion. There is much beauty in the surrounding of the farmer, and now and then the farmer—more frequently his wife—is aware of it. But we are hardly able to think which of our neighbors would be likely to second, with a clear conscience, Mr. Grayson's postulate. Farm life is not voluptuous; it has its sober satisfactions, and even pleasures. The present commentator prefers it to the life of the urban centres,

> Where wealth accumulates and men decay.

But it has also its drawbacks—which Mr. Grayson chooses to ignore.

The Green Patch. By Bettina von Hutten. New York: Frederick A. Stokes Co.

The unbeaten path is this author's favorite walk. Without sensationalism she keeps her readers asking "What next?" till the uttermost page. If her characters seem self-contradictory, it is partly so because the reader has approached them from the standpoint of the hide-bound public who may not be surprised. Such a public fully expects ugly ducklings to become angels toward the middle of the book when the childhood's hero returns. It is confident that dark-eyed Latins who stare at beauty in public will prove to be villains. And so on. "Probabilities" are in this case all at fault. No one has looked for the incoherences of Nature, but for those of standard fiction. The opening sentence discloses Christopher Lambe on that day when he "found that he could no longer bear his wife, his three little girls, Lambe House, Sussex, England, in general." His principles and temper are excellent, but his tastes are for a warm country, objects of art, and to be let alone. His wife says she is sorry, adding, "Of course, you will do as you like." And he does. The rest of the story deals with the blameless Italian life of Christopher, the painless passing of his wife, and the love affairs of his daughters. When grand crises arrive the pleasure of the unsensational becomes almost a pain. For then jilted bridegroom, lover thwarted in the chase, forsaken wife, absentee husband, behave with a mildness beside which mother's finger, held up at Mary for fratricide, is harsh. Yet, after all, in a prickly world, there is something comfortable about this method, and when combined with cleanliness, amusing scenes in agreeable places, and with a light and tactful touch, it makes for a certain sort of thin, harmless enjoyment.

The Pendulum. By Scota Sorin. New York: Duffield & Co.

Life's mighty pendulum, we learn, swings to and fro; from extreme to extreme; now rising to the sunlit heights of hope, now sinking to the gloomy depths of despair. Unluckily, the oscillations here recorded are of small account in the sum of things. The central figure is totally deficient in charm as well as in principle, and there is no perceivable ground of interest in her shabby career. In fact, she is so utterly worthless that it is hard to believe in her at all. But she has sprung from good stock, and she produces, by inadvertence, a beautiful and virtuous daughter: hence the applicability of the "pendulum" figure. The book is worth noting merely as an instance of a type of crude fiction which, in spite of an apparently overstocked market, continues to be put forth. The phenomenon can be explained only by the supposition that the demand for fiction is now so great that there is a chance for almost anything published in its name. The public is "schooling," and the bare book will serve!

The Camera Fiend. By E. W. Hornung. New York: Charles Scribner's Sons.

Mr. Hornung has hitherto been unique in applying a highly personal, felicitous style to the novel of crime and mystery. The charm of Raffles is as much in his *bravura* of talk as in the actual adventure. That is quite contrary to the general custom of practitioners in this delectable field of sleep-banishing literature. In his latest book, Mr. Hornung has tied himself down to a more matter-of-fact narrative style than the Raffles books, although it is still a style very much his own. But he has not sacrificed characterization, another element that is usually held superfluous in this type of story. There is a delightful boy in the "Camera Fiend," a charming public-school boy of seventeen who suffers from asthma and quite wins your admiration as he goes wheezing and coughing his plucky way toward duty and excitement. Besides asthma, Pocket Upton sometimes walks in his sleep. He did it one early morning in Hyde Park with a revolver strapped to his wrist, and when he awoke, there was an old vagabond lying on a bench, shot through the heart. We

have all sorts of great detectives. To save Pocket Upton, Mr. Hornung devises an elephantine contrast to the slender and ascetic Mr. Holmes. Eugene Thrush has any number of chins, and in the intervals of shaving them he gulps brandy-and-soda.

Elisabeth Koett. By Rudolph Hans Bartsch. Translated by Ludwig Lewisohn. New York: Desmond FitzGerald.

It will be difficult for Americans to take this book so seriously as is expressly requested by author and publisher. Tested by utter common sense, Elisabeth Koett, a pretty actress, stirred up an absurd amount of fuss and feathers. Born in a suburb of Graz, the daughter of a janitor, she is discovered by young Wigram, the mystic, who walks the night in torture at thought of her possibilities. He is the apostle of Novalis, of the Night, of Death—"the mightiest, the ninth and last symphony of God," that splendid goal of all true pressing on! It is his philosophy which, in the end, wins out over her frailties. But she has much to learn beforehand. With her woman's instinct for power, she seeks to express her restless spirit in exciting admiration. She goes to Vienna, where men kiss her hand and cry aloud from the pain of it. Still finding in herself no permanence of feeling, she turns to the simplest of her admirers, Peter Strehl, a poor engraver, in rapture that real love has come to her at last; but again is disappointed. What though Peter hangs himself, there is a glory, an exaltation in the act which she inspired.

In the end, Elisabeth, after receiving a fortune from a baron and becoming a countess, returns to her maker, young Wigram, to find her happiness and mission in disseminating her art away from the vulgar market place, in towns that had known of no such wonder.

As there had been mystic yearnings in her pleasure, so must there be mystic madness in her work. On, on, she must press without ceasing.

"A secret fire is eating its way into you, Elisabeth," he said tenderly, "beware lest it consume you!"

"Ah," she cried, "is that not the best fate I can hope for—to be consumed by a noble fire in the days of my youth!"

The translation by Mr. Lewisohn is excellent.

WILLIAM MORRIS.

The Collected Works of William Morris: With Introduction by His Daughter, May Morris. Vol. I, The Defence of Guenevere, the Hollow Land; Vol. II, The Life and Death of Jason; Vols. III and IV, The Earthly Paradise. New York: Longmans, Green & Co. To be issued in 24 volumes, $78.

Even *éditions de luxe* are, or should be, designed for reading, and the most important question in regard to these limited publications concerns their type, paper, and format. It may be said at once that the present publication (of which only 1,000 sets are for the market) is both beautiful to the eye and not too heavy for the hand. The typographical work is done at the Arden Press under the direction of C. H. St. John Hornby, and the paper is specially manufactured from rags. The binding is rather flimsy, but is evidently intended to be replaced by the owner. For illustrations the volumes have photogravures of portraits, and various prints. Notable among the latter are the wood engravings by Morris himself from designs by Edward Burne-Jones for the "Cupid and Psyche": these have never before been printed, and are extremely interesting.

The editor's Introductions are in a general way like those contributed by Mrs. Ritchie to the Biographical Edition of Thackeray—a pleasant medley of reminiscence and bibliography. There is, for instance, in the Introduction to the fourth volume a really charming scene in "Grandma's home at Leyton," where Morris and his family used often to visit. One does not think of Morris engaged in reading family prayers, though, to be sure, he passed through a period of religious fervor at Oxford. "My father reads the psalm of the day beautifully," writes Miss May Morris, "as if he enjoyed it, but when he comes to the prayer by a modern divine he delivers it with short decisive accents." Another anecdote gives us a glimpse of life at Kelmscott Manor, when Rossetti was a guest and was painting the famous Water-Willow portrait of Mrs. Morris. "We girls," says the editor, "were fond of the picture when it was finished, but it bothered me to have house and church and boat-house all brought together, when they were really in different directions." A fine drawing of Kelmscott Manor by F. L. Griggs accompanies the text in this place.

In the more important field of bibliography there is a good deal of information that will be welcomed by the lover of Morris's verse. The inception of the various poems and many circumstances attending their production are noted down. Those not familiar with Morris's method of work will be surprised to learn how fastidious he was in rejecting unsatisfactory sketches. Miss Morris quotes freely from these rejected MSS., and thus affords a glimpse into the processes of the poet's taste. The Prologue to the "Earthly Paradise," for example, was first composed in free quatrains, of which the following may be taken as a specimen:

Oho! Oho! Whence come ye, sirs,
Drifted to usward in such guise
In ship unfit for mariners,
Such heavy sorrow in your eyes.

O masters of this outland shore,
When first we hoisted up our sail,
We were all furnished with good store
Of swords and spears and gilded mail.

In comparison with the swinging, swift hexameter couplets in which the Prologue finally appeared, these quatrains are certainly meagre and, in any considerable number, would have been very monotonous. The following account of the MSS. of the "Cupid and Psyche" is interesting as an example of Morris's search for the right form, and as an illustration of his method of correction, which was ordinarily by entirely rewriting under a fresh inspiration rather than by the laborious substitution of word for word:

Three manuscripts exist of it, an early manuscript—the first draft in various forms—the clerk's copy worked upon, and the clean "copy" for the printers. Before the tale reaches its final form, page after page is cancelled, incidents are altered, and the tale indeed largely rewritten. Originally, following Apuleius, Psyche's grief impels her after the flight of Cupid to go to her sisters with bitterness and guile in her heart, and after recounting the night's tragedy she brings them relentlessly to their death: as the tale finally took its shape, all this violence and vengeance on her part gives place to the sombre dooming of the gods. The delicate little song sung to Psyche in the palace by invisible musicians:

O pensive, tender maid, downcast and shy, . . .

replaces two other trial-pieces, one in the early manuscript (from the quarto notebooks I have described), and another in the clerk's copy above mentioned. Both of them consist of stanzas strung on a thin thread of story (the story different in each), and the second poem has less warmth and color than the first—both of them were discarded for the right lyric, which comes finally and seems to have grown in its place.

Altogether this edition of Morris is desirable both for its mechanical make-up and for its editorial material. The six volumes of translations by Morris and Eirîkr Magnússon are not included, but these are procurable in the Saga Library published by Quaritch, and indeed are well separated from Morris's original work. Among the principal hitherto unprinted works to be included are a journal kept during Morris's first visit to Iceland in 1871, some lyrics and extracts from the tale of "Orpheus" designed for "The Earthly Paradise," and some fragments of a poem in the poet's earlier manner entitled "Scenes from the Fall of Troy."

A Suffolk Hundred in the Year 1283: The Assessment of the Hundred of Blackburne for a Tax of One-Thirtieth and a Return showing the Land Tenure There. Edited by Edgar Powell. Cambridge: The University Press. New York: G. P. Putnam's Sons.

Mr. Powell, already well-known for his scholarly work on the peasant up-

rising of 1381, has made in this admirable study a contribution of great merit in a new and more restricted field. Students of mediæval history are well aware of the importance of local material for general history, and yet are constantly hampered by the scarcity of documents, and discouraged by the difficulties of interpretation and by the dreariness and monotony of the task which such evidence involves. Mr. Powell possesses not only the expert training, but also the patience and courage essential for work of this kind. Yet even he can complain of the tediousness of the undertaking, and the thirty-eight folded sheets which accompany his text bear eloquent testimony to the truth of his comment.

Mr. Powell has edited two statistical records of the thirteenth century relating to a single hundred of Suffolk. The first of these records is a detailed assessment of the inhabitants to a tax of one-thirtieth part of their goods, granted by a parliament in 1283; the other is a return as to land tenure in the same hundred made at a slightly earlier date, 1280. To these documents he has added four surveys of manors in the same hundred of date 1302 and three or four other documents. His object is to throw light on the system of taxation under Edward I and on the condition of population and rural economy at the same period.

Edward I, needing money to carry on his Welsh campaigns, summoned two provincial parliaments to consider the question of assessment. These parliaments met, one at York and one at Northampton, and made a grant of a thirtieth toward the expenses of the war. The writs summoning knights of the shire, two representatives of each city, borough, and market town, and with them all freeholders capable of bearing arms and holding more than a knight's fee, have long been known, but the record from the Bury Abbey registers, which Mr. Powell prints, giving the form of the grant and the method by which the assessment was to be carried out, is new. Though there can be no doubt that much of the tax was paid in kind, the fact, obtained from a document in the Public Record Office, that cartage expenses would be allowed implies that the assessment had to be turned into coin locally by the sheriff before delivery to the constable of the Tower. The only extant record of collection is for the single hundred of Blackburne, in a document of seventy skins in the British Museum, yet again by good luck Mr. Powell was able to find in the Lay Subsidy Rolls the totals from each of the counties. Lincolnshire heads the list with £4,000, and Westmoreland comes last with only £212, the whole reaching the sum of £42,765. That local collection was often a difficult and dangerous business is shown from a document in the Assize Rolls, also discovered by Mr. Powell, relating to one of the Suffolk villages, where the bailiff was set upon and severely handled by the son of the lord of the manor, who was behind in his payment. Whether such incidents were common or not, only a careful study of the Assize Rolls can prove, but this particular happening distinctly enlivens a treatise otherwise unexciting.

Regarding population and rural economy results based on such meagre and limited evidence are inevitably inconclusive; Mr. Powell shows, however, that tentative deductions are possible. As a whole, population in this hundred of Suffolk has remained about stationary for 600 years; some of the villages have actually lost in numbers, others have gained very slightly, while a few have gained considerably. In comparing live stock then and now, we discover that the number of horses, sheep, and pigs has increased, while that of cattle has fallen off materially. More interesting still is the record of ownership, for in 1300 there were 1,380 inhabitants among whom the live stock was distributed, whereas in 1908 the number was but 519; and it is likely that the figures for the earlier period understate the situation. Wheat, rye, barley, oats, peas, and beans were the prevailing staples. Among the inhabitants there were scarcely any tradesmen, and those dealing only in a few shoes and a little brass ware. Nine carpenters, five weavers, fifteen artisans or mechanics, and fifteen merchants are mentioned in a population of nearly fourteen hundred. As to the status of the inhabitants, the record is disappointing, and few conclusions regarding the history of villeinage can be drawn. More can be learned regarding land tenure, as the evidence throws considerable light on the acreage held in villeinage, the demesne lands of the lord, and the nature of the services of villeins, molmen, and freeholders. A small amount of information is afforded for the study of scutage and knights' service.

Up Hill and Down Dale in Ancient Etruria. By Frederick Seymour. New York: D. Appleton & Co. $3 net.

In the plentiful crop of amateurish books on art-history the Etruscans have been almost entirely spared. The reason for their escape from the treatment to which so many of their fellows have been subjected is probably the fact that their history, their language, and their art are so intricate and as yet so uncertain that the best thing, even for the self-confident amateur, seemed to be to leave them alone. But now the very mystery surrounding the Etruscans, which so far has proved their safeguard, has been their undoing at the hands of Mr. Seymour. For it is this element of mystery, so we gather from the frequent allusions to it throughout the book, which chiefly attracted the author. And perhaps, this being so, it is natural that he does not contribute anything toward lifting the veil; rather, the reader is likely to be a good deal more mystified at the end of his reading than at the beginning, for the book is what we should expect from "a casual inquirer into the Etruscan mysteries" (as Mr. Seymour calls himself)—both superficial and inaccurate.

The volume is divided into two parts. The first contains chapters on the origin and history of the Etruscans, their religion, their art, and their language; the second gives descriptions of a number of Etruscan cities, preference being given to the abandoned and less known sites. It would be impossible here to mention all the inconsistencies and blunders of which the writer is guilty in these "casual inquiries." A few will be enough to point out the half-digested knowledge and the originality of the author.

Mr. Seymour seems somewhat troubled that archæologists have not given the Etruscans their due for artistic ability and so tries to be more liberal himself by making emphatic, though unsupported, statements, such as "the paintings in Etruscan tombs owe nothing to Greek influence" (p. 66). He also thinks it unfair to believe that only the poorer figured vases found in Etruria should have been made by the Etruscans and that all the others have come from Greece; he, therefore, settles the question more impartially himself by pronouncing that the vases are partly importations and partly of native manufacture. It is a pity that the author, when he is trying so hard to do well by the Etruscans, forgets to mention, in his chapter on the Arts of the Etruscans, the black Bucchero ware, which is universally agreed to be a native product.

The ease with which Mr. Seymour disposes of problems which are still moot questions with archæologists is enviable. As is well known, it is a disputed point whether the Phœnicians had an art of their own or were merely intermediaries between other nations. In Mr. Seymour's mind the question is at once settled by the fact that Cyprus, which was occupied a long time by the Phœnicians, should be so rich in ancient remains (p. 27). That these remains do not represent Phœnician art, but show throughout foreign influence, does not occur to him. Again, the whole Mycenæan race problem is settled in one sentence: "The Pelasgians founded Tiryns (by far the most ancient), Argos, and Mycenæ, whence this Mycenæan or this Ægean art originated" (p. 71). That the excavations of Crete during the past ten years have proved that island to have been the originator and centre of Ægean art is now a fact so well known that it is

curious that it has escaped even Mr. Seymour.

Nor is his knowledge of later art any more sound. A black-figured Panathenaic vase found at Orvieto (which cannot be earlier than the sixth century B. C.) is quoted to be one of the oldest vases in the world (p. 264), and red-figured Athenian vases from Vulci, belonging to the fifth century B. C., are put down as "fine instances of the grand style of the fourth century" (p. 175), a mistake of which few beginners would be guilty.

But perhaps we could make allowances for these irritating inaccuracies, if otherwise the book were agreeable reading. The author has, indeed, besprinkled his pages with pleasantries and with sentimental meditations, but it is unlikely that these will appeal to the sense of humor and sensibilities of the reader. For it requires more than ordinary imagination to compare the incident of a bullock stumbling in the plain of Vulci and thus leading to the discovery of the old city, with the story of the prophet Balaam and the ass (p. 188)! The style is probably meant to be picturesque, but it soon grows tedious, for the book abounds in sentences such as this (p. 240):

> Farms surrounded by verdant crops, and all oblivious of the thousand forefathers that sleep beneath the much-tilled soil—unwept, unhonored, and unsung, and undiscovered, which is worse.

Studies in Language and Literature in Celebration of the Seventieth Birthday of James Morgan Hart, November 2, 1909. New York: Henry Holt & Co.

The *Festschrift* as a form of literature has something of the discontinuity of the dictionary; but there is unity of a kind; all these miscellaneous bits of learning are ultimately sprung from the teaching of the master to whom they are offered in gratulation, and their very variety is a tribute to his breadth. In the present volume pretty much the whole range of English studies is represented, besides a plea by Herbert L. Fordham, of the New York bar, for a more thorough study of English on the part of lawyers, and a neat classification of contemporary American philosophers by Prof. Frank Thilly.

Subjects in Old English are appropriately numerous. Dr. Alma Blount urges enthusiastically, and quite reasonably, the necessity of some knowledge of the inflected stage of the language among teachers of English grammar even in the seventh and eighth grades; she describes the workings of a course in the Michigan State Normal School which is successfully providing teachers with this equipment. Prof. Christobel F. Fiske sketches rapidly some advances shown by eleventh-century England over social conditions described in the "Beowulf": the partial emancipation of woman from a position of absolute dependence on her tribe; the gradual passage of judicial procedure from private hands into a function of the state; some slight progress in *materia medica;* and the merging of the multitude of heathen deities into the conception of a single ruling power. On the last point the method adopted yields somewhat unsatisfactory results; surely, it is pressing fancy pretty hard to see in *gāstbona* (Beo. 177) a reference to Thor, and to regard Grendel as a degradation of Loki. Dr. Mary A. Malloy confines herself to a succinct description of the differences between the Celtic and the Roman rite with respect to the form of the tonsure and the date of Easter. Prof. George H. McKnight shows how tradition, chiefly of clerical origin, reveres King Alfred, not for his warlike prowess, but for his generosity, justice, wisdom, and humility.

Of matter more purely textual, we have a Middle-Irish fragment of Bede's "Ecclesiastical History," printed with translation and notes by Dr. Edward G. Cox, for which, on linguistic grounds, a new date—the early tenth century—is suggested. Dr. Benton S. Monroe offers some textual notes on Layamon. A list of the non-biblical names in the English mystery plays is compiled by Prof. Antoinette Greene; from the fact that the name of Mahomet is by far the most frequent we dare not infer a profound mediæval interest in comparative religion. Confirmation of the early date (1381-2), for the composition of Chaucer's "Knight's Tale," Prof. Oliver F. Emerson finds in the lines (2965 ff.):

> Thanne semed me ther was a parlement . . .
> To have with certein contrees alliaunce,

which seem to be a reflection of the elaborate negotiations connected with the alliance between England and Bohemia and the marriage of Richard II and Anne.

In the field of drama, Prof. Joseph Q. Adams, jr., collects all that is known concerning the seventeenth century letter-writer, Thomas Forde, and in particular, discusses his tragi-comedy "Love's Labyrinth," which proves to be a dramatization of Greene's "Menaphon," itself deriving ultimately from "Havelok the Dane." Prof. Martin W. Sampson devotes a brief discussion to the plays of Edward Sharpham. The words of the Ghost Prof. William Strunk, jr., regards as the only trustworthy clue to the heart of Hamlet's mystery; a careful study of them results in some sensible conclusions in regard to the entire play. It is interesting to recall that tradition assigns the part of the Ghost to the author himself.

Clearly Professor Hart has sent abroad in the world an able band of working scholars, whose labors we trust he will long live to contemplate with satisfaction.

Notes

Spring and summer publications of Houghton Mifflin Co. include: "The Long Roll," by Mary Johnston; "Queed," by Henry Sydnor Harrison; "People of Popham," by Mary C. E. Wemyss; "The Very Little Person," by Mary Heaton Vorse; "My First Summer in the Sierra," by John Muir; "Reminiscences of an Athlete," by Ellery H. Clark; "The Ideal Italian Tour," by Henry James Forman; "Across South America," by Hiram Bingham; "Palestine and Its Transformation," by Elsworth Huntington; "China's Story," in myth, legend, art, and annals, by William Elliot Griffis; "John La Farge," by Royal Cortissoz; "Harriet Beecher Stowe," by Charles Edward Stowe and Lyman Beecher Stowe; "Life and Letters of Martin Luther," by Preserved Smith; "John Bright," by R. Barry O'Brien; "California Under Spain and Mexico," 1535 to 1847, by Irving B. Richman; "American Political Ideas," by John Fiske, new edition; "The Origin and Growth of the American Constitution," by Hannis Taylor; "Copyright: its History and Law," by Richard Rogers Bowker; "A Year in a Coal-Mine," by Joseph Husband; "The Tudor Drama," by C. F. Tucker Brooke; "A Study of Versification," by Brander Matthews; "The World of Dreams," by Havelock Ellis, and "The Standard of Living Among the Industrial People of America," by Frank Hatch Streightoff.

D. C. Heath & Co. are about to issue Rosegger's "Der Lex von Gutenhag," edited with exercises, notes, and vocabulary by B. Q. Morgan; and soon, thereafter, C. F. Meyer's novel, "Jürg Jenatsch," abridged and edited with introduction and notes by A. Kenngott.

The hero of "The Grain of Dust," the novel by the late David Graham Phillips, which the Appletons bring out this month, is the aggressive and, of course, youngest member of a firm of corporation lawyers.

An encyclopædia on ecclesiastical matters is promised by Sir Isaac Pitman & Sons, entitled "The Churchman's Guide"; the general editor is Arthur Reynolds.

"Guide to the Best Historical Novels and Stories," new and enlarged edition, by J. Nield, is in the announcements of Elkin Mathews.

There will be an exhibition at Glasgow of manuscripts and printed copies of the Bible, in celebration of the tercentenary of the authorized version. Professor Milligan of the university is at work on a catalogue of exhibits.

Books announced by Frederick A. Stokes Co. for the month of April include: "Called Away," by Susan Glaspell; "Lassoing Wild Animals in Africa," by Guy Scull, and "Dawn of O'Hara: The Girl Who Laughed," by Edna Ferber.

Dana Estes & Co. have in their spring list: "A Modern Outlook, Studies of English and American Tendencies," by J. A. Hobson; "Talleyrand, the Man," translated from the French of Bernard de Lacombe by A. D'Alberti; "For Her Namesake," an anthology of poetical addresses, edited

by Stephen Langton; "British Mountain Climbs" and "Swiss Mountain Climbs," both by George D. Abraham; "The Dog Lover's Book," written and illustrated by Edwin Noble; "Through the Heart of Canada," by Frank Yeigh, and "The Journal of Captain Cartwright," edited by Dr. Charles Wendell Townsend.

Henry Holt & Co. are adding a sixth volume, entitled "A Garland of Childhood," to the series of anthologies which they started with "The Open Road."

The Scribners have in their list of spring announcements: "The Letters of Robert Louis Stevenson," revised edition containing more than a hundred new letters; "The West in the East," by Price Collier; "A Defence of Prejudice," and other essays, by John Grier Hibben; "Rachel: Her Stage Life and Her Real Life," by Francis Gribble; "Narratives of Early Carolina," edited by A. S. Smalley, jr.; "Trails of the Pathfinders," by George Bird Grinnell; "A Kitten's Garden of Verses," by Oliver Herford; "Brother Copas," by Sir A. T. Quiller-Couch; "Brazenhead the Great," by Maurice Hewlett; "An Old Maid's Vengeance," by Frances Powell; "The Greek Thinkers," a history of ancient philosophy, by Prof. Theodor Gomperz; "Biblical Geography and History," by Prof. Charles Foster Kent; "Children of To-morrow," by Clara E. Laughlin, and "Her Little Young Ladyship," by Myra Kelly.

Among the important new announcements of the house of J. C. Hinrichs of Leipzig is a work by Prof. Adolf Harnack, entitled "Neue Untersuchungen zur Apostelgeschichte und zur Abfassungszeit der synnoptischen Evangelien." It will appear some time this spring.

The *Geographical Journal* for March opens with an account of the second French Antarctic expedition by its leader, Dr. J. B. Charcot. Its main object was to endeavor to connect the different points of land which have been discovered in order to determine the existence of a continuous continent. Among the other contents are the reports of an interesting journey in northeastern Arabia by Capt. G. E. Leachman, and one in western China by Maj. G. Pereira, who says that in some of the regions through which he passed the opium regulations "had been obeyed with strictness." Among the maps are three illustrating Dr. A. Stein's explorations in Chinese Turkestan and Kansu, with a long explanatory note by him.

The latest installment of the "Oxford English Dictionary" (Frowde), is a single section, *Si-Simple*, by W. A. Craigie. Of its 820 main words, perhaps the most curious historically are those derived from proper names—words now decapitalized, depersonalized, and conferring upon their original owners but an ambiguous and shadowy immortality. In some cases we can see their concrete and metaphorical sense fading beneath our eyes. A French politician of the eighteenth century holds for a brief period the office of comptroller-general, where he makes himself obnoxious by his petty economies; a hundred years later his name helps us to describe an artistic effect in the heavens. "A spur of the coast range," writes Bret Harte, "which had been sharply *silhouetted* [petty-financiered?] against the cloudless western sky." In a happy day for his posthumous reputation, Étienne de Silhouette (1709-1767) became a skiagram. It is to be regretted that the Oxford editors do not go behind the previous dictionaries to trace the link between the man and the shadow pictures, but merely present three old conjectures—that (1) his small economies, (2) his short tenure of office, or (3) his own attempts at outlining perpetuated his memory in that slight thing—a silhouette. Less fortunate than Silhouette's was the immortality that lay in wait for Simon Magus, the well-intentioned ex-sorcerer of Samaria, damned to an eternity of infamy by the sharp-tongued Simon Peter. In a moment of hot-headed enthusiasm for the new religion into which he has been baptized, Simon Magus offers cash payment for the Holy Ghost, for which cause the apostle declares him "in the bond of iniquity." Simon Magus is very sorry and begs to be prayed for, but already, if we may be permitted the expression, his goose is cooked—he is slated to become a by-word. Dante thrusts him wrong side up into a hole in the eighth circle of hell and sets fire to the soles of his feet; Langland derives from him the mediæval vice Sir Simonye; and his name comes down to us burdened undeservedly with the ecclesiastical sins of two thousand years. Simon Pure, on the other hand, has plainly profited by the oblivion which has swallowed up his origin. The resourceful lover in Mrs. Centlivre's clever comedy, "A Bold Stroke for a Wife" (1717), palms himself off for Simon Pure till "the real Simon Pure," a canting Quaker from Pennsylvania, appears. The first allusive use of this expression on record occurs in "Guy Mannering" (1815): "'Here,' proceeded the counsellor, 'is the real Simon Pure—here's Godfrey Bertram Hewit.'" Later users of the name possibly got the cue from Scott. Presently, at any rate, it is employed with only the faintest reference to its origin. In 1889 we have "the Simon-pure wild horse"; in 1894, "the simon-pure article"—a mysterious compound in which the given name of the now vanished Quaker seems to modify his surname and guarantee that foodstuffs of that description will meet the approval of Mr. Wylie. The oddest of recent formations are the adjective *siamese* and the verb *to siamese*, words which obscurely commemorate Chang and Eng, the poor twins, who, in the early nineteenth century, struck the imagination of Europe with a union closer than that of brothers.

In his "Manual of International Law for the Use of Naval Officers" (the Naval Institute, Annapolis), Admiral C. H. Stockton has performed a real feat of condensation. His thirteen chapters do not extend beyond 270 pages (excluding appendices), yet within that space he is able for practical purposes to cover the whole field. The latest leading cases have not escaped his notice, and what he has to say about the Declaration of London—he himself, we believe, was one of the United States delegates to the naval conference which drew it up—is especially pertinent and illuminating. His little book is, in a word, most serviceable, and might be placed in the hands of newspaper writers and Congressmen to as good advantage as in those of naval officers. The work makes no pretence of being an original contribution; it follows the authorities; but it is a model of brief and clear and accurate statement.

The fiftieth and concluding volume of the Sacred Books of the East comprises a "General Index to the Names and Subject-Matter" (Frowde), compiled by M. Winternitz, professor of Indian philology, in the University of Prague, with a preface by A. A. Macdonell. But this is no ordinary index, such as might have been made from the special indexes attached to each volume. In fact, "compiled" is not the right word for the title. The book contains an index of nearly seven hundred pages, in which every name and topic occurring in the translations of the preceding forty-nine volumes is catalogued scientifically, so that one can follow a subject through its most minute divisions. Under the caption "animals," for example, are given lists of references dealing, first, with the creation of animals, then with the different classes, as presented by different religious systems, then the use, treatment, laws, and regulations, mythology, worship, and sacrifice of animals. The work is thus not a mere list, but an illuminating survey, useful to the general reader as well as to the specialist. It makes a sort of handbook which can be read for itself, since the headings of the various divisions are, in themselves, a commentary on the subjects treated. As it has been a labor of many years to create such an index, so it will be for many years a thesaurus of great value to the student, whether he be an Orientalist or an historian of religious or social phenomena. It is, in truth, as Professor Macdonell says in his preface, "the most comprehensive work of the kind that has yet been published."

A lengthy plea for the rehabilitation of the literary fame of Metastasio is furnished by Prof. A. De Gubernatis in his latest volume. "Pietro Metastasio" (Florence: Successori Le Monnier), in which he has gathered together a series of lectures on the Cæsarean poet, lately delivered by him at the University of Rome. The case is certainly an interesting one. In the whole history of literature, no author has been so extravagantly praised during his lifetime, and so quickly forgotten after his death, as Metastasio. How did this happen? The explanation offered by Professor De Gubernatis is rather surprising. At the end of his first lecture, after quoting a wearisome mass of adulation heaped upon the poet by his contemporaries, but noting the few gentle strictures ventured here and there, he observes (literally): "Each laudatory critic noting a mole in Metastasio, these moles, combined, became a gangrenous spot which disfigured the face of the so universally admired writer" (p. 49). Any one thus explaining the vicissitudes of literary fortunes can scarcely be expected successfully to champion the dubious cause of Metastasio. The speedy and total eclipse of Metastasio's fame is in no way involved in mystery. Along with the rest of the *rococo* world, of which he was one of the most typical figures, he was caught up and swept out of existence by the blast of the new régime; and a recurrence of his vogue is no more likely than is that of the periwig. Mild curiosity on the part of students of literature he may often awaken; but posterity, to which the contemporaries of the Cæsarean poet solemnly committed his fame, has atoned with a vengeance for the ex-

travagance of a former ago which set a skilful opera-librettist above Æschylus and Sophocles; and its verdiet, one might add, is likely to stand.

"The Historic Mohawk" (Putnam), by Mary Riggs Diefendorf, with twenty-four illustrations, is described by the author as a series of general essays depicting the peoples, settlements, eustoms, and struggles of that historie valley in early days. It goes over ground familiar to most persons interested in the subjeet, but with rather better literary skill than some other local writers have shown. It eontains also a number of letters and other documeutary papers, not heretofore published, although these are introduced without much attempt to abstract their vital parts and incorporate them in an interesting way with the narrative. The author has not constructed the story with much historical sense as to proportions, main outlines, and details, but the information brought together will, no doubt, interest many persons dwelling in the valley. A few minor errors may be noted. Jogues is said to have perished "at the Mohawk capital." There was, of course, no such place, exeept that there were two or three places known as a Mohawk "castle." The massacre of Schenectady is dated in 1790, which is somewhat more than a century too late. Col. Guy Johnson is set down as "Sir Guy Johnson." Sir William's son, John, inherited his father's title. Guy was Sir William's son-in-law and had only a military distinction. Chatham is called "Lord Pitt." After the Revolution, the Mohawks are said to have "founded a new Caughnawaga near Montreal. The new Caughnawaga had been founded before the Revolution. After the war, most of the Mohawks, who had invaded Central New York, went to the Grand River Valley, which lies north of Lake Erie. The Caughnawaga Mohawks were mainly those who had been converted by the French to the Catholic faith.

The title of "Two Russian Reformers: Ivan Turgenev, Leo Tolstoy," by J. A. T. Lloyd (Lane Co.), was apparently ehosen rather to attract readers than to describe the contents of the volume. Mr. Lloyd treats of Turgenev and Tolstoy almost entirely as writers of novels, touching only very lightly on their work as reformers. He gives us somewhat over three hundred pages of readable, impressionistie criticism, in tone strongly suggestive of the books by Haumant ("Ivan Touguénieff: la vie et l'œuvre") and Merezhkovski ("Tolstoy as Man and Artist"), to which, among others, he acknowledges indebtedness. Long passages of unsystematic and only slightly profitable—sometimes even misleading—chit-chat are relieved by flashes of real insight, of which the following comparison is a fair sample:

> It was the art of Turgenev to woo this or that phantom baek to him, and then quickly he or she would assume the delicate, always half-veiled tints of life. Tolstoy would recall, as from a short distance, his men and women as though they were old friends whose inner and outer lives he knew by heart (p. 265).

The book as a whole, based though it is rather on elever observation than on either hard study and reflection or fine imaginative sympathy, may do good service by attracting new readers to the two greatest Russian novelists; for those who are already familiar with their works it will be of slight value.

The projectors of the World Missionary Conference held in Edinburgh in June, 1910, proeured the appointment two years before the conventiou dato of eight commissions to investigate as many special subjects in the missionary activity of the modern Christian church. It was agreed that eaeh eommission should consist of twenty members, including representatives from both Europe and America. These commissions were instructed to pursuo thorough investigatious in their respective fields concerning missionary enterprises of all denominations in all parts of the world. The eight topics assigned to them were as follows: "Carrying the Gospel to All the Non-Christian World," a survey of the field and the forees availablo for its conquest; "The Church in the Mission Field," tho problems of organization, discipline, and edification of churches in non-Christian lands; "Christian Education," the relation of schools and colleges to the propagation of Christiau faith; "The Missionary Message," a study of Christian doctrine as related to missionary effort; "Preparation of Missionaries," the problem of preparatory education; "The Home Base," the administration of missionary boards, and the cultivation of missionary sentiment in the home church; 'Missions and Governments," the eivic rights and duties of missionaries as residents of foreign countries; "Coöperation and Unity," eomity and federation among missionary societies. These eight eommissions made earnest work of their tasks, and their respective reports, which were presented to the conference and formed the basis of its discussions, are informing and suggestive presentations of their respective subjects. Much pains was taken in securing information from all parts of the world, and the commissions were evidently guided by men of broad and statesmanlike view. We feel our respect for missions increase as we examine these volumes and are prepared to give credence to the rumor that the best men in the divinity schools are now turning their attention to the foreign field. The ordinary religious convention report is as wearying as the gathering itself, but these volumes, assembling facts from every corner of the world in the interest of a holy ambition, are fresh with interest and thought in nearly every chapter. The volume on "The Home Base" contains a bibliography of above two hundred pages, comprising works on missions in every modern language employed by aggressive Protestants. Each commission report contains a list of the large number of contributors of information and opinions, besides an index. The ninth volume is a history of the conference, containing also some of the addresses delivered at the evening meetings. The series is published by the Fleming H. Revell Company.

The Academic Commission for the Thesaurus Linguæ Latinæ, which did not hold its contemplatel meeting in October, will convene in the Easter week of the present year. Serious financial difficulties are hampering the progress of this important international enterprise; and although several governments have increased their annual appropriations for this purpose, there is already a deficit, amounting to over five thousand marks. The work, however, is going right on and sixty-one *Bogen* were brought out last year, the editors being now at work on the letters D to F.

A complete edition of the works of the German poet Friedrich Rückert is not yet in sight, though he died forty-five years ago. He was so prolific that the many volumes of his writings whieh appeared during his life eontained but a part of what he produced. Nor have the several collections drawn from his posthumous papers by any means filled the gaps. It has long been known that he contributed to magazines, almanacs, annuals, and other publications numbers of original poems and translations, which have hitherto been included in none of the separate volumes or series of volumes bearing his name. The Gesellschaft der Bibliophilen (Weimar) has just published the first volume of a eollection of his poems scattered through magazines, almanacs, annuals, etc., under the title "Rückert-Nachlese I." This volume, following so close on the heels of the three of "Schiller's Persönlichkeit" (see *Nation*, XCI, 503), stamps the society as a friend of poets as well as of books. The editor, Leopold Hirschberg, has spared no pains in his effort to make the collection complete. He arranges the poems chronologically, according to the date of composition, so far as known, otherwise the date of publication. In a later volume he will include a eollection of supplementary strophes to texts already published. The volume just out, an octavo of 436 pages, contains 490 poems, which, for the most part, show Rückert's unusual versatility and unquestioned talent, if not genius, though a certain number, as would naturally be expected, add nothing to the wealth of the literary world. It takes all, however, to complete the picture, and this collection, when finished, will be one of the chief works of reference in a Rückert library so fortunate as to possess it. The edition is limited, and is distributed exclusively to the society's 900 members. Twenty-five copies came to the United States, seventeen to libraries, and eight to individuals.

The German Antiduell Liga, which now has a membership of 2,250 in nineteen local groups, tries to counteract a traditional evil in a practical way. Not only does it publish a periodical, *Ehrenschutz*, which is sent free to five hundred editors and to a large number of student societies, but it maintains three courts of honor (Ehrengerichte) at Darmstadt, Hanover, and Munich, where "matters of honor" are adjusted by arbitration, and the plan has been fairly successful. In one particular case the league sent in a petition to the Kaiser, who in reply stated that duelling should be resisted as much as "feasible," but refused to condemn the practice absolutely.

The official statistics for 1909 record 9,070 divorces in Prussia, or 129 to every 100,000 inhabitants, as compared with 6,924 in 1905; 7,539 in 1906; 7,952 in 1907, and 8,365 in 1908. In 47.8 per cent. of the eases, or 4,332 instanees, the ground was adultery.

According to recent statistics, the number of secondary schools in Prussia at present is 719, as compared with 559 in 1901. Of these 253 are directly under state control and 466 under municipal control. The total expenses for the current year are 74,000,000

marks, of which tuition and income from endowment funds furnished only 36,000,000, the rest coming from state and municipality. The number of pupils, according to latest reports, was 220,959, as compared with 156,663 in 1901. That means the increase in attendance has been 41 per cent., while the growth of the population has been only 15 per cent. The *Frankfurter Zeitung* thinks, in view of these facts, that the spectre of a "learned proletariat," which used to haunt Bismarck so much, is not yet disappearing.

During the present semester there are 2,778 girls in the various schools of Prussia that offer the courses leading up to the *Abiturientenexamen* and admission to the universities; a year ago there were 1,975. To these must he added 150 girls, taking the *Gymnasialkurse* in Berlin. According to the statistics published by Dr. Güldners in the journal *Die höhere Mädchenschule*, 2,928 girls and older women, in addition to those who have prepared themselves privately, have already passed the examinations for entrance to the universities. Prussia alone has thirty-two girls' schools that prepare for higher institutions, and of these, eight have the full nine years' course and are recognized by the government; four are under state control, four are private schools, and twenty-four are municipal institutions. The great majority, twenty-eight, have the semi-classical and semi-scientific course of the *Realgymnasium*, while only two have the full classical course, and two are special schools for the training of *Oberlehrerinnen*.

The Rev. Charles Joseph Little, president of the Garret Biblical Institute of Northwestern University, who died last week in his seventy-first year, was the author of "Christianity and the Nineteenth Century" and "The Angel in the Flame."

Curtis Guild, sr., father of ex-Gov. Curtis Guild, died at his home in Boston, on Sunday, aged eighty-four. Both his grandfathers served in the Revolutionary war and a great-uncle, Dr. Samuel Guild, was an assistant surgeon with Commodore Paul Jones and was the last to leave the sinking frigate Bon Homme Richard after the famous sea fight with the British frigate Serapis off the coast of Scotland. His father, Curtis Guild, was in the East India trade, but a business disaster compelled the son to leave school at the age of sixteen and go to work. After serving as a shipping clerk, he entered the employ of the Boston *Journal*, and eventually became the dramatic critic. Mr. Guild became a contributor to the *Knickerbocker Magazine* in New York, and took a position with the *Evening Traveller*, being admitted to partnership with Roland Worthington in 1856. In 1859 he established the *Commercial Bulletin*, a weekly publication making a specialty of business matters, and continued as publisher up to a few years ago. He was the author of "Over the Ocean," "Abroad Again," "Britons and Muscovites," "From Sunrise to Sunset" (verse), and "A Chat about Celebrities."

Ex-Senator Augusto Pierantoni, professor of international law and a delegate to the last parliamentary conference at Washington, is dead in Rome, Italy. Pierantoni was an Italian authority on international law whose writings have been widely translated. He was born at Chieti, Italy, on June 24, 1840. His classical education, which he got in his native city and in Naples, was interrupted by war. He enlisted as a volunteer in Garibaldi's army, and was with it at Volturno. When peace had been declared he became engaged in the ministry of public education at Naples, went subsequently to Turin, and then, on the strength of several works in international law, was installed as an instructor in the University of Modena. In 1866 he went to war again as a volunteer in the conflict with Austria. Upon his return to teaching he was called to the chair of international law at the University of Naples, and was later promoted to the University of Rome. He was chosen Senator in 1883 and served through four legislative sessions. He was the arbitrator for Italy at the Paris conference of 1885 concerning shipping in the Suez Canal. He was a founder of the International Law Institute at Geneva.

Léon Boucher, who died recently at Lausanne, aged seventy-three, was honorary professor of literature at Besançon. He was the author of "Histoire de la littérature anglaise."

Science

THE KLAATSCH HYPOTHESIS.

PARIS, March 2.

"Before the war" Americans were familiar with the hypothesis of different centres of creation for the human species. For the most part, it was a political defence of the different treatment awarded to blacks and whites on the ground that they had no common ancestor. Sometimes it was scientific, as with Agassiz, to solve difficulties arising from the geographical distribution and corresponding differences of human races. The later Darwinian doctrine of the Descent of Man was bound, in its turn, not to leave the idea of one First Man unmolested.

The German anthropologist Klaatsch thinks he has found two distinct stems or lines of descent. These must have given two distinct human species at the beginning, though no one can deny that they were already fused in one in prehistoric ages. The very perfect skeletons of Klaatsch's first distinct species which have been found in France within a few years (see *Nation*, January 14, 1909), and the measures now being taken by the French government to prevent the expatriation of them, lend unusual interest to this latest hypothesis, although it will certainly not be the last in the matter.

Klaatsch's first species is represented by the Man of Neanderthal, the type of Quatrefages's first fossil race of man (Crania Ethnica—Canstadt). This line of descent, according to Klaatsch, gave off by the way, before it reached Man properly so-called, the gorilla, who was differentiated like a poor relation unable to rise to the condition of his betters. Neanderthaloid human skulls have, in common with the gorilla, a continuous penthouse projection over the eye-orbits. This character, it should be said at once, has survived in many known instances of historic times. In 1864 the bishop of Nancy, in the course of a complete revision of the relics of his diocese, had an anatomical examination made of the skull of the Irish Saint Mansuy, preserved in the one-time cathedral church of Toul where he was bishop in the sixth century. The skull was of a pronounced Neanderthal type. On account of the number of Irish missionaries among the Gallo-Romans of that time, Vogt designated skulls of this type "heads of apostles." In 1867 Vogt published an account of a still more pronounced instance existing in a German physician of the insane personally known to himself. Other striking examples have been observed among living men and women in England, Denmark, Belgium, and particularly grouped in certain isolated communities of Brittany. This long since bolstered up the conclusion of Quatrefages and Hamy (1874) that "present-day populations are descended from the quaternary populations"; and that "the Neanderthal type is still found in modern populations." Another character insisted on by Klaatsch as being possessed by Neanderthaloid men in common with the gorilla consists in muscle insertions giving extraordinary strength and leverage.

The second distinct species of fossil man, according to Klaatsch, is the man of Aurignac, a name somewhat confusing to those acquainted with the anthropological geography of France. Strictly, this should indicate the Neolithic race investigated by Lartet; he mistakenly thought it contemporaneous with the "antediluvian" animals, as they were then called, whose bones were found in an underlying stratum of fossil remains. Klaatsch points to the absence of the gorilla penthouse above the eye-orbits, and to different muscle insertions, similar to those of the orang-outang, to prove another specific line of descent with another poor relation left beside the way.

In general, the new hypothesis has met with little favor, even in Germany. In England, Keith (*Nature*, December 15, 1910) remarks that this method of insisting on small differences, while passing over the numerous points of likeness, would prove that Newfoundland dogs and bears constitute a species by themselves and mastiff dogs and leopards another. To this Klaatsch has the ready answer that the like characters in the case are simple phenomena of convergence.

This scarcely strengthens his contention, in that which is always most difficult to substantiate in evolutionary hypotheses, namely, the differentiation of species in prehistoric times. The facts

of survival in the one human species of to-day render French authorities in the matter skeptical of his theory which would oblige them to explain something, not a primordial differentiation in the descent of man, but an integration of one species from the original two, as already shown in prehistoric remains. Quatrefages found survivals of the flattened tibia and channelled fibula for the insertion of the peroneal muscles in several parts of France, with other striking characters of his second fossil human race (Cro-Magnon), to which Klaatsch's man of Aurignac corresponds. This helped Hamy to a further conclusion: "No fossil human race has disappeared; we can still recognize them all amid the later populations with which they are mingled." In the Klaatsch hypothesis, this would mean a mingling together of two species distinct in their line of descent, that is, present-day men would be hybrids of two originally distinct animal species of the Genus Homo, having no common ancestor that was human.

In unscientific but not inexact words, some prehistoric mother of ours would have been more nearly related either to the gorilla or to the orang-outang than she was to her husband. In the hypothesis of different creation centres, this difficulty did not present itself, since each first man was supposed to have been like all the others, a single species with them. In the evolutionary hypothesis of Klaatsch, there must have been at least two first men from specifically different lines of descent. This would singularly complicate the origin of the one present species, man. S. D.

The United States Department of Agriculture has issued a bulletin (B. P. I. No. 202) in which the subject of the Seedling-Inarch and Nurse-Plant Methods of Propagation is discussed in connection with tropical and subtropical fruits and ornamental plants.

The Società degli Spettroscopisti Italiani is engaged on the fortieth volume of its "Memorie di Astrophysica ed Astronomia," which is edited by Professor Riccò.

Although the older generation of mariners repelled the faintest suggestions of improvement in things nautical, your modern sailor is compelled to accept innovations. With the advent of steam began the shattering of old traditions, and now the ever-widening field of naval technics constantly brings new problems. Hence the revision and enlargement by Capt. Austin M. Knight, U. S. N., of "Modern Seamanship" (D. Van Nostrand Company), a book that has been long accepted as a trustworthy manual. Chapters on handling torpedo vessels and submarines, keeping station and manœuvring in squadron, and hints for junior officers are entirely new, while that on the rules of the road has been extensively revised. Capt. Knight has retained a brief description of sailing vessels, some familiarity with such craft still being regarded as a desirable factor in the education of naval officers. While the book is a treatise for the sailor, it has its interest for the layman. All the bewildering details of a ship are described in simple, direct language, and an extensive series of plates assists him to an understanding of the general subject.

In our death notice last week of Jacobus Henricus van't Hoff, taken from a press despatch, the name and age of the great chemist were wrongly stated. His name is given in "Wer Ist's?" as here printed, and his age was fifty-eight, as he was born in Rotterdam August 30, 1852.

Dr. Henry Pickering Bowditch, eminent physiologist and formerly professor in the Harvard Medical School, died last Monday at the age of seventy. After graduation from Harvard in 1861 he served through the civil war; he studied in France and Germany, and later received the LL.D. degree from the universities of Edinburgh, Toronto, and Pennsylvania, and that of doctor of science from Cambridge, England. He was a member of learned societies, both in this country and abroad, and was the author of several books, among them being: "Growth of Children," "Hints for Teachers of Physiology," "Is Harvard a University?" "Are Composite Photographs Typical Pictures?" and "Advancement of Medicine by Research."

Drama

MOLIERE'S SUCCESSORS.

The deluge which Henry Bernstein so proudly challenged in his play, "Après Moi," seems to have broken loose sooner than the author expected. Even French rioting must sometimes be taken seriously; and one of the first official acts of the new Cabinet was to request M. Bernstein to withdraw his play from the Comédie Française in the interests of public peace. The causes that enter into the antics of a Parisian mob are usually complex. In the present instance we find all the possible components—politics, race-hatred, and a fine passion for disorderly conduct. These have all been duly chronicled. But two factors of considerable importance have been overlooked. One is personal animosity. The trade of authorship in Paris is not the impersonal business it is among us. Every writer there has his enemies as well as his friends. In the case of a man who has risen so fast as Henry Bernstein, his enemies are pretty sure to outnumber his friends, a circumstance which probably had some effect on the rioting at the Théâtre Français. The other factor is the honest resentment which may have been aroused by the play itself. There were demonstrations at the Théâtre Français a few years ago when Octave Mirbeau's "Foyer" was first presented. Mirbeau is not of Jewish descent, and has not been accused of evading his military duty. Yet in the plays with which Mirbeau and Bernstein chose to make their début at the Comédie Française there is a common trait which was entirely responsible for the earlier *affaire*, and may partially account for the later.

Every little while a bitter cry is raised in fair France against a world that sadly misunderstands her. It takes this form: Why will foreigners persist in deriving their impressions of French literature and French social conditions from the gutter press, from novels of the sewer written for export purposes, and from the drama of the boulevards? The France depicted there is not the real France, etc., etc. There was even talk, a few years ago, of organizing a book syndicate for the dissemination of decent, representative French fiction in foreign countries. The syndicate is not yet formed, but the plaint continues. Very well, the intelligent foreigner will say; we will pay no attention to the drama of the boulevards; we will turn to the Comédie Française, the national stage, the conservator of the highest dramatic tradition, the house of Molière, admission to which constitutes the stamp and seal on a playwright's reputation. The playwright who is at work on his first manuscript for this august institution will surely do his very best to produce a work of dignity, of artistic restraint, and above all, of the utmost fidelity to the national life and genius. So we learn that Mr. Bernstein's "Après Moi" begins pleasantly, as follows:

> Suddenly, just as the financier [a thief, in danger of arrest and determined upon suicide] is about to pull the trigger, the door opens and his wife, with dishevelled hair and in scant attire, stealthily returns to her chamber from her first clandestine meeting with her lover. . . . His ferocious determination to ascertain the identity of his wife's lover is baffled in a frightful scene by his wife.

A refreshing episode and of peculiar appropriateness on the boards trod by the Cid, Iphigénie, and Alceste!

Octave Mirbeau's was a similar case. The great and deserved success of "Les Affaires sont les affaires" made him a candidate for the Comédie Française. He produced "Le Foyer," in which the principal figure is a Senator and member of the French Academy who traffics in his wife's honor to save himself from financial ruin. M. Claretie, director of the Comédie Française, who had accepted the play in an incomplete form, refused to stage it. The courts decided in Mirbeau's favor, and "Le Foyer" was produced amidst hostile demonstrations. Needless to say, it has not appeared frequently on the *affiche* since then. The director who accepted Henry Bernstein's latest play is presumably not too squeamish. But neither he nor his audiences could stomach a play which deliberately set out to throw mud at an entire nation—the writer's own. Mir-

beau must have reasoned it out coldly: the nobility does not count in this country; the only forms of eminence we recognize are political and artistic; let me take then a man who unites in his own person both these distinctions and in their highest form, and accuse him of the vilest conduct to which a man can stoop; the result must be exceptionally dramatic. Either this imagined process of reasoning really was gone through, or else the horrible story must be accepted as a faithful copy of life. If the story is true, what becomes of the complaint that France is misunderstood? If it is not true, why should such a libel be produced on the national stage?

Actually, the intelligent foreigner is in no danger of misunderstanding the French people. What he is in danger of misunderstanding or, rather, of not understanding is the French stage. He knows that no nation has a monopoly of the virtues or the vices. There were misbehaving kings before Agamemnon, and there are financiers who are careless about other people's money even in the United States. Granted that the prevalent tone of French literature is the result of tradition and imitation, precisely as it is everywhere else, the fact still remains that a tradition, to maintain itself, must have popular approval behind it. It may very well be that the typical Bernstein play is no more a faithful picture of French life than the chocolate-drop and "b'gosh" drama is true to the life we know. But whereas we feel persuaded that it is natural to like chocolate and sentiment, it is difficult to see why a nation should go on liking what the ordinary Parisian theatre audience certainly does seem to like. We say ordinary; there are undoubtedly a great many Frenchmen who are outraged by the drama of intensified slander; the fortunes of Mirbeau's play testify to that. But why should the great majority be so happy in seeing itself pitilessly and ceaselessly traduced?

Although it deals with well-worn topics, the "As a Man Thinks" of Augustus Thomas, produced in the Thirty-ninth Street Theatre on Monday evening, is a fresh, able, and important play. Virtually it is a plea for tolerance in all matters affected by racial or religious prejudice, and for justice in the relations of the sexes. The details of the story are too involved to permit of an analysis at once brief and intelligible. The dramatic interest centres in the fate of a young gentile married woman who, exasperated by the repeated infidelities of a husband to whom she has been devoted, compromises herself with a former lover, whom she was not allowed to marry because he was a Jew. Although innocent in deed, if not wholly in intent, her husband —heedless of his own marital offences— holds her guilty of the worst, discards her peremptorily, and begins proceedings to divorce her and deprive her of her child, whose legitimacy he impugns. These complications are finally solved through the philosophic, resolute, and beneficent intervention of a Jewish physician, who plays the part of deus ex machinâ throughout the piece, preaches tolerance and justice in social and religious questions, and lives up to his own maxims by exhibiting a fine and gentle resignation when his daughter defeats the one hope of his heart and violates the strongest article of his faith by marrying a Christian. Many plays, of course, have dealt with similar theories, but Mr. Thomas handles them with rare intelligence, a bold yet tactful touch, a keen eye for dramatic effect, and a remarkable mastery of theatrical technique. His work is in many respects worthy of Pinero. It exhibits the structural neatness, the logical development, the compact, suggestive, and witty dialogue which distinguish the best work of the English dramatist. Dr. Seelig becomes a most attractive and impressive figure in the hands of that highly accomplished actor, John Mason, who embodies it with suave and tender dignity, virile passion, and polished ease. There is one moment—when Seelig moralizes upon the lofty mission of the Hebrew faith—in which he rises to a high pitch of histrionic eloquence. And he is supported by an uncommonly good cast, including Chrystal Herne, Vincent Serrano, Walter Hale, and Amelia Gardner, all of whom do exceedingly well. It is not often nowadays that so good a play and performance are seen in combination.

The annual Shakespeare Festival at Stratford-upon-Avon will this year extend over three weeks, beginning on Easter Monday, April 17. For the twenty-third time the performances will be under the direction of F. R. Benson. The programme will include fourteen plays of Shakespeare: "Othello," "Macbeth," "Romeo and Juliet," "Julius Cæsar," "Much Ado About Nothing," "Merry Wives of Windsor," "As You Like It," "The Merchant of Venice," "Twelfth Night," "A Midsummer Night's Dream," "The Taming of the Shrew," "Richard II," "Henry V," and "Richard III." Four Chester mystery plays, "The Critic," by Richard Brinsley Sheridan, and "The Piper," by Josephine Preston Peabody, will also be presented. The opening performance will be "Romeo and Juliet," in which Lewis Waller will appear as Romeo, Charles Quartermaine as Mercutio, and Madge Titheradge as Juliet. Oscar Asche and Lily Brayton will give a matinée of "Othello." Henry Ainley will appear as Orlando and Cassius, Matheson Lang and Miss Hutin Britton as Macbeth and Lady Macbeth, and Otho Stuart as Gratiano and Brutus. The matinées will include "Much Ado About Nothing," in which Fred Terry will appear as Benedick and Julia Neilson as Beatrice; and "As You Like It," in which Lena Ashwell will play Rosalind to the Orlando of Henry Ainley. The National Theatre Society from the Abbey Theatre, Dublin, will, on two occasions, give a selection from their Irish plays. Sir Herbert Tree, Arthur Bourchier, Constance Collier, and Violet Vanbrugh also hope to take part in the festival.

George Pleydell is the author of a new comedy, "One of the Dukes," which will be produced soon in the London Playhouse by Cyril Maude, who will himself assume the principal character, a young aristocrat, with a good heart and a feeble head. The three acts occur in an English country house. Allan Aynesworth and Alexander Carlisle will have prominent parts.

There is to be a revival of "The Prisoner of Zenda" at the London Lyceum, with Henry Ainley in the principal character.

The Elizabethan Stage Society, in London, under the direction of Mr. William Poel, has produced "Jacob and Esau," a sixteenth century morality, and "The King and the Countess." "Jacob and Esau" is a play of interest to students of the early drama, and may possibly have been written by William Hunnis. "The King and the Countess" (which the Elizabethan Stage Society has played before) consists of the first two acts of "Edward III," a play whose authorship has been the subject of much discussion. The Elizabethan Stage Society ascribes it unhesitatingly to Shakespeare.

"The Pioneer Players" is the name of yet another play-producing society which has been formed in London for the special purpose of presenting propaganda plays, more particularly those dealing with the women's movement. Miss Edith Craig is the general director, and a number of well-known authors have promised their support, including Cicely Hamilton, Beatrice Harraden, Herman Hijermans, Ford Madox Hueffer, Elizabeth Robins, and G. Bernard Shaw. The first performance will take place in the first week in April, and will consist of a one-act realistic play by Mrs. H. W. Nevinson, a specially written play in which Ellen Terry and many leading actresses will appear, and a one-act comedy. Arrangements have been made for subsequent performances of Laurence Housman's censored play, "Pains and Penalties."

Commenting upon a revival of John Masefield's "Nan," in the London Court Theatre, Mr. Walkley writes:

To all *les âmes bien nées* among playgoers it is a joy to see Miss Lillah McCarthy once more playing Nan. It is a performance of perfect and haunting beauty.

The English papers comment upon the dexterity with which Sir William Gilbert has turned his hand from fantasy and humor in dramatic composition to a realism that outdoes Mr. Galsworthy. The scene of his sketch, "The Hooligan," is laid in the cell of a condemned murderer, early in the morning of the execution. Nothing is spared and nothing overdrawn. A reprieve arrives only after the victim has gone into a frenzy of hysteria; when the strain is relieved, the reaction is too great, and he falls dead.

W. S. Maugham's latest comedy, "Loaves and Fishes," just produced at the Duke of York's Theatre in London, seems to be an amusing but inconsiderable work. The hero of it is a successful clerical humbug who becomes a bishop. The critics complain that he has nothing particularly clerical about him, except his clothes—none of the typical characteristics which made the parsons of Anthony Trollope so realistic.

In his production of "The Merry Wives of Windsor" at the Garrick Theatre, in London, Oscar Asche has departed from old theatrical tradition by furnishing a winter setting, for which he finds ample justification in the text. The change, at all events, lends additional poignancy to the ducking of the fat knight.

The first performance of Henry Bataille's new play, "L'Enfant de l'Amour," has tak-

on place at the Porte Saint-Martin Theatre in Paris. The piece is a study of the crisis in the life of Liane Orland—admirably played by Mme. Réjane—and of her natural son Maurice, l'enfant de l'amour. The latter is determined to prevent a rupture between his mother and her lover of seventeen years' standing, Rantz, played by M. Dumeny. To achieve this end he employs the basest methods, and, finally, when Rantz, a minister and millionaire, consents to marry Liane, Maurice, in order not to wreck his mother's happiness, submits to banishment to the United States. The part of Maurice was acted by André Brule, and the play, though somewhat long-drawn-out, had an enthusiastic reception.

Liebler & Co. have accepted for early production a new four-act play entitled, "As It Was in the Beginning," by T. Wigney Percyval, of the "Promender Walk" company, playing at Wallack's. It is the story of a man and his wife, whose early struggles have been followed by a prosperity which has finally forced them apart. The scenes are laid in South Africa.

The London newspapers print liberal and sympathetic notices of the late James Mortimer, the American diplomatist, correspondent, and playwright, who passed so large a part of his life in Paris and London. He was an intimate friend of the third Napoleon, and it was through him that the exiled Emperor and Empress settled at Chiselhurst. It was the Emperor who supplied him with the money to establish the London *Figaro*, long since defunct. Between thirty and forty of Mortimer's plays were produced in London, the first being a little comedy entitled "Joy is Dangerous," which was played at Drury Lane in the early seventies with Miss Fanny Brough and the late Charles Warner in the cast. One of the best known of his dramatic works is the comedy "Gloriana," which was first produced in 1891 at the old Globe Theatre, and has twice been revived at Terry's Theatre under the name of "The Artful Valet." It was in a successful adaptation by him of "La Dame aux Camélias," entitled "Heartsease," that Mme. Modjeska made her first appearance in London in 1880. The last play of his acted in London was "My Bachelor Past," a farcical comedy produced some years ago at Wyndham's Theatre.

Music

Brahms. By J. A. Fuller-Maitland. New York: John Lane Co. $2.50 net.

Now that Wagner is generally acknowledged to be the greatest of all opera composers, the "compleat Wagnerite," who used to be scoffed at because of his extreme partiality, has almost disappeared. The "compleat Brahmsite," however, still prevails to a considerable extent. While not epidemic, he is extremely virulent, scornful of every one who does not share his opinion that Brahms is flawless, noble, incomparable, sublime, holy. A typical Brahmsite is Mr. Fuller-Maitland, for years musical critic of the London *Times* and editor of the new edition of Grove's "Dictionary of Music and Musicians." His latest volume bears the brief title of "Brahms"; but that is enough to attract some readers, to repel others. It can hardly be called a life of Brahms; the few incidents of his career are related in thirty-one pages, and none of them seems particularly important or interesting. Anecdotes in abundance exist about this witty composer, but Mr. Maitland ignores most of them, probably because they have been told so often, and devotes his remaining 234 pages to analyses of the diverse kinds of Brahms's compositions.

The most exacting Brahmsite will be satisfied by these analyses, in which superlatives hold high carnival. Nearly everything is praised, and obvious flaws are whitewashed. "All the themes of Brahms," we are told, "have the finest melodic curves that were ever devised in music. No man has ever attained such uniform distinction of utterance, and the presence of the two exceptions just noted throws into higher relief the extraordinary nobility of everything else." There are "touches of thrilling simplicity," "matchless eloquence," "irresistible power," "unflagging melodic beauty." "It is not easy to point to any single songs, of whatever date or country, that are worthy to be mentioned in the same breath with 'Immer leiser' and 'Auf dem Kirchhofe.'" As for flaws: in others, misplaced accents are a serious matter, but in Brahms (pp. 66, 182) it is pedantry to object to such things, which are "easily excused." No fewer than seven times the author refers to pages which prove the absurdity of the charge that Brahms is deficient in pianistic or orchestral color. Shortcomings in scoring in some symphonic movements arise from Brahms's "temporary indifference to, not from any inability to handle, orchestral color." What in others is paucity of ideas, is in Brahms "economy of material." The fact cannot be blinked, of course, that Brahms freely helped himself to other men's melodies, but this information is imparted not in the rude fashion of another Englishman who called Handel "the grand old thief." No enthusiast's feelings can be ruffled by Mr. Maitland's way of saying that in one Brahms movement "one thinks immediately of Beethoven's ninth symphony"; in another there are "unconscious quotations" from Wagner's trilogy; in another, Brahms "bows in turn" to several other composers; in still another there is an "allusion" to Schubert; and so on.

In the Introductory "Note on Enthusiasm," which takes the place of a Preface, the author states explicitly that he did not write this book "with any desire to make unwilling converts." He might nevertheless have made these—for enthusiasm is contagious—had it not been for his unfair attitude toward Liszt and Liszt's followers. Liszt was the archfiend who upset the musical equilibrium by proclaiming to the world that the old classical forms had done their full duty and should be replaced by new forms, shorter, more pliant, and varied. With bitter scorn the author declares that "those who make the most diligent search for new forms in music, or for new structural possibilities, are precisely those in whom the fountain of actual invention runs low." Inasmuch as all the prominent modern composers except Brahms have been influenced by Liszt's suggestions as to new forms, this is rather severe on them; severe also on Schubert, Beethoven (in his last symphony), Chopin, Schumann, Wagner, and other great masters who were rich in ideas yet sought new forms of expression. But the sentence just quoted is interesting, as a complete characterization of the "compleat Brahmsite."

It was Brahms who was deficient in musical ideas and who turned to the juggleries of thematic development to help himself out. As one of his intimate friends once wrote: "Why, dear master, when you can produce gold, do you so often give us brass?" Had Mr. Maitland separated the brass from the gold, dwelling only on those of Brahms's works which are likely to live, he would have done his idol and the world a greater service. However, those who are in the fold, or who can make allowance for his bias, will find much interesting matter in the analyses he has made of the symphonies, songs, pianoforte pieces, and other works of Brahms. In England, it should seem, the vogue of this composer is still increasing, which is not the case in this country. The songs and symphonies are still heard in our concert halls, but of his piano pieces scarcely half-a-dozen are played during a metropolitan season. In England, we read in these pages, "scarcely a recital programme is to be found which does not contain one" of Brahms's pieces. At a Holloway concert a working man was heard, after a quartet of Beethoven had been played, to remark as he left the hall, "Ah, that's all very well, but give me my Brahms!" It is very curious that England, after utterly ignoring Schumann, should have made so much of his epigone, Brahms.

The production of new operas continues at the Metropolitan at an unprecedented rate. Mr. Gatti-Casazza has staged Puccini's "Girl of the Golden West" and Humperdinck's "Königskinder," to which will shortly be added "Ariane and Blue Beard" and "Twilight," while Mr. Dippel has brought over from Philadelphia "Natoma" and "Suzanne's Secret," to which he will add "Quo Vadis" in two weeks. "Suzanne's Secret" had its first American performance on Tuesday night. It is a one-act opera, by a young Italian composer, Wolf-Ferrari, who was already favorably known in this city through his cantata, "Vita Nuova." His opera had its first hearing in Munich on No-

vember 4, 1909. It is a trifle light as air. Count Gil suspects his wife of receiving the attentions of another man, because he has repeatedly smelled the odor of tobacco in the parlor, and neither he nor his dumb valet smokes. There are scenes of jealousy and fury; he breaks in two the umbrella she hands him and smashes most of the furniture. The audience is in the secret long before he is; for Suzanne twice smokes a cigarette. The second time he enters through the window and discovers her in the act, whereupon, in his joy, he lights a cigarette for himself, and the valet follows his example. To this frothy action Wolf-Farrari has added music which is appropriately light and airy. His models evidently were Mozart's "Figaro," Rossini's "Barber of Seville," and Verdi's "Falstaff"; these, with Puccini, peep out of the score for a moment here and there, but the main themes and their elaboration are the composer's own. He has a real vein of melody and, what is almost equally important, a gift of fluent comic musical comment. There is a great dearth of comic operas, nearly all grand operas having a tragic ending. Puccini's operas and most of Verdi's and Wagner's end tragically, or, at least, sadly. Whether Wolf-Ferrari is the man to create a new "Falstaff" or "Meistersinger" remains to be seen; but his "Secret of Suzanne" gives good promise. He has found the secret of combining the old style of opera buffa with modern orchestral effects, and, at the same time, writing tuneful vocal parts. His opera was most cordially applauded. It gave the local public its first opportunity to hear Carolina White, and she impressed one as being the best of the new singers in the Chicago Opera Company.

Art

THE AMERICAN ACADEMY IN ROME.

Through the consolidation of the American Academy and the American School of Classical Studies in Rome a unique institution comes into being. It is the first time within our knowledge that the experiment of teaching conjointly the practice and history of the fine arts will have been tried on an ample scale. For six years past the Academy has provided facilities for work and study to young architects, painters, and sculptors of proved proficiency. Its prototype was the famous Ecole de Rome, like which it has been a residential school. For a matter of sixteen years the School of Classical Studies has made an excellent record purely as a teaching body. The two will now join forces as a bipartite residential school in the beautiful Villa Aurelia on the Janiculum.

This is a novel experiment, and to preserve a just balance between artists and scholars the terms of consolidation provide that the resident fellows of the School of Classical Studies shall not outnumber those of the Academy. We shall have, then, in close association, picked men devoted to different but kindred aims, and it will be most interesting to observe the effect of these two sorts of academicians on each other. Such a companionship should on both sides have a liberalizing tendency. For the artist, fellowship with the investigator may suggest that there is more in art than that over-prized element, temperament; for the scholar, the example of the artist may teach that the dry light of reason is not wholly illuminating without some tincture of genius. Such is the result for which one must hope, and undoubtedly this mutual advantage is what the movers of the consolidation had in mind. The experiment is to be tried under the most favorable auspices and gives every promise of success.

Of the two allied schools, the Academy has already achieved its form and will merely seek to expand upon its present lines. In the famous French School it had a classic model. Its function is rather to provide opportunity than instruction. Its fellows are supposed to have found themselves already, and while it should afford a delightful rendezvous for artists visiting Rome, its specific advantages are in the nature of the case individual and not capable of wide distribution. It was obviously a wise provision, then, that its fellows should not be outnumbered and overshadowed by those of the School of Classical Studies, a department that affords almost unlimited possibilities of expansion. The school has concentrated upon classical literature and archæology, but has also given instruction in the mediæval and Renaissance field. It remains merely to build upon this beginning. From the first the school has worked in harmony with the school at Athens. As the work of the school at Rome expands, it may seem expedient to establish special branches elsewhere. Florence, for example, seems the natural home for a school of mediæval and Renaissance studies, while investigators of Byzantine art will naturally rotate among Florence, Rome, and Athens. In short, by direct expansion or affiliation almost endless opportunities of usefulness open before the School.

Moreover, there is no reason why its activities should be confined to archæology. Rome is an admirable centre for the investigation of the literature, philosophy, law, and theology of the Middle Ages and the Renaissance, so far as these are of Latin derivation. All these fields the School should gradually cover, in coöperation with the Italian and foreign teaching bodies, as fast as means and opportunity permit. In fact, the only limitations set to its usefulness are those of money, of the standard that can be maintained for its fellowships, and of the scholarship available for its teaching force. Its fellowships and professorships should and doubtless will be among the most coveted academic distinctions. For present purposes the Academy has funds, but its needs are constantly growing, and it must have increasing support. On the basis of the records of its constituent bodies it can confidently appeal to the generosity of all those interested in the broader development of American art and scholarship.

Because the School is the more fluid body, we have dwelt especially upon its prospects, but it should be evident that the prosperity of the School is also that of the Academy. On both sides the consolidation increases the possibilities of the right sort of international acquaintance. Aside from the daily give and take of the resident professors and fellows, there are many investigations in which the artist and the archæologist are natural confederates. And the artist can only gain from contact with an outlook that includes not merely the visible remains of Rome, but also, most broadly, the whole record of distinguished artistic achievement in the Western world.

The Byzantine Research and Publication Fund, in connection with the British School at Athens, has issued a circular of its programme. It has on hand important works on churches in Asia Minor, churches of Constantinople and Salonika, besides smaller monographs on many European Greek monuments. The society desires to effect a thorough survey of the Byzantine material on the Greek islands in Macedonia, Egypt, Sicily, and Northern Africa. A study of "The Church of the Nativity at Bethlehem," edited by R. Weir Schultz, will shortly be published. This society, which covers an important field hitherto neglected by English and American scholarship, wishes new subscribers. Donors of not less than a pound sterling annually receive, free, certain of the less expensive publications, paying at will half-price for other more expensive works. The fund has a strong staff and deserves support. General correspondence should be addressed to the secretary, R. Weir Schultz, Esq., 14 Gray's Inn Square; contributions to the treasurer, H. A. A. Cruso, Esq., 31 Ladbrooke Square, London, W.

"The History of Art in Egypt," by M. Maspero, director of the Ghizeh Museum, is promised shortly by Houghton Mifflin Company.

"Frank Brangwyn and his Work," by Walter Shaw-Sparrow, with 20 reproductions in color of pictures by Mr. Brangwyn and 16 collotype reproductions of etchings and lithographs, will be issued by Dana Estes & Co.

"A B C of old English China," by J. F. Blacker, which is announced by John Lane Co., has 200 illustrations and is designed to help the collector.

E. Durand-Gréville, in his "Hubert et Jean Van Eyck" (Brussels: Van Oest) sets out with the resolute intention of discovering the works of Hubert and fully verifies the promise that he who seeks shall find. Including copies of lost originals, Hubert emerges fitted out with the very impressive baggage of forty-eight pictures; Jan remains with half that number. M. Durand-Gréville's point of departure is the compar-

ison of the Singing Angels (Jan's) and the Playing Angels (Hubert's) in the Ghent altarpiece. Hubert reveals a softer and more painterlike mood, and paints frankly; Jan is more sculptural and builds up his pictures with glazes. We have no space to follow the reconstitution of Hubert's work from this beginning. In general the process involves a great in-sweep of pictures of most disparate temper, quality, and, we are sure, date. Perhaps the most satisfactory attributions are those of the little Dresden triptych and the closely allied Annunciation and Last Judgment of the Hermitage to Hubert. A group of crucifixions, of which one in the Aynard collection, Lyons, is characteristic, can, we feel, fit plausibly into the *œuvre* of no great painter. They seem like the work of a routine craftsman, who, for that matter, is almost certainly not Flemish but French. It also goes hard to accept such rather secondary works as Lord Northbrook's Madonna and the "Van der Weyden" of Vienna as from Hubert's hand. In short, the results of this ingenious study will hardly be adopted without very grave abatement. It is interesting to note that the "Jan van Eyck" Madonna of the Metropolitan Museum is listed as a copy of Hubert by Petrus Christus, while St. Francis Receiving the Stigmata, in the Johnson Collection, Philadelphia, is also set down provisionally as a Hubert. St. Francis, in the Turin replica (or copy) of this picture, has the disadvantage of having two right feet. This tautology does not trouble our author, who regards it as an "inadvertence more likely to occur in an original than in a copy." The quarto is handsomely made, and contains some seventy-five excellent reproductions.

William Webster, said to be the oldest landscape gardener and horticulturist in this country, died recently in Rochester, aged ninety-four years. Webster designed and superintended the construction of some of America's most notable parks. He came to this country from England in 1828.

Finance

STUDYING A "SITUATION."

The present week is one of those occasions when both Stock Exchange devotees and outside men of business address one another in really interested tones with the inquiry what they think of "the situation." Sometimes this question, and the answer to it, are entirely perfunctory; the exchange of views is talk for the sake of talk. Sometimes habitual oracles admit that "the situation is mixed," or that they "cannot make it out." But sometimes, also, there is a perceptible trend of opinion towards cheerfulness or discouragement, with attentive examination of each successive event or announcement to see what confirmation, if any, can be had. Apparently, this is the state of sentiment at the present moment.

Is business improving, or not? If it is improving, then is the betterment substantial enough to be encouraging, or so slow as to chill the budding hopes? We have had the light thrown in turn, these past few days, on several quarters of the business world where experienced people look for information. Iron is now, as ever, the barometer of trade, and last week we had the iron production returns for the year to date. From the 2,617,000 tons of last March, the country's monthly output had decreased steadily to the 1,759,000 tons of January, 1911. February's output increased 35,000 tons over January; but nevertheless, while January's average daily output of iron was 30 per cent. below the maximum month of 1910, February's daily average, despite the month's better showing, was still 22 per cent. below that maximum.

In January the total value of the checks drawn on the country's banking institutions was 15 per cent. below January, 1910. February showed a decrease of less than 7 per cent. from a year ago. This is improvement, but it is obviously slow. On the Stock Exchange (whose activity or inactivity sometimes reflects the state of outside trade) January's sales of stocks were nearly 60 per cent. less than in 1910. February's business was 37 per cent. below 1910. Here again is improvement over January, though results again do not compare well with the majority of other years.

What, then, is to be the inference from all this? Perhaps it is reasonable to infer that trade activity will increase slowly and deliberately, but steadily, and that, granting good harvest results, we shall be on a really comfortable basis in the autumn. Even as regards a crop uncertainty, last week's government report on grain reserves—showing that farmers hold to-day, from the crops of 1910, the largest amount of corn ever carried over at this season except for 1907, and the largest amount of wheat with three exceptions only—is in a way a guarantee against the bad results on general trade, even from disappointing harvests in 1911.

So far as regards the markets of the day, the really essential fact is that illusions have been removed, that blindfold reasoning from wish to thought has been restrained, and that each successive event, with every phase of the general situation, is studied in the cold light of common sense. There have been times—as in 1908 and 1906—when such humdrum fashion of framing opinions was discountenanced as the path to pessimism. Recent events have shown, however, that the rule will work both ways. No one imagines that, with the markets on financial stilts, and Wall Street discounting to-day what could not happen within the next twelve months, such an incident as last week's Mexican news could have been received as rationally as it was. Only markets in a normal condition are able to pass judgment normally, and the fact that four such successive incidents as the rate decision, the extra-session announcement, the War Department's exploit, and the New York Central's dividend reduction, were surveyed in Wall Street just as they were surveyed by intelligent men outside of Wall Street, is the best of all testimony to the entirely normal character of the market itself.

Among several other incidents which markets have not received as they might have been expected to do, the New York Central's dividend reduction is not the least conspicuous. Wall Street displayed no consternation and no very great interest; the market itself acted as if the reduction had been expected long before. Nobody heard, in the casual conversation of the market, the angry or regretful comment that this was the first-fruit of the iniquitous railway rate decision. It is true, the president of the New York Central declared in a public interview, next day, that the dividend reduction had occurred "as a result of the decision." But the Stock Exchange took no interest whatever in his explanation. It was this same railway officer who, nine months ago, when the Government had first intervened to compel postponement of the rate increases pending review by the Interstate Commission, declared that "if the railways are to remain solvent, the only recourse now is an advance of freight rates." The fact that this sweeping statement was made at a moment when his own company was negotiating loans, showed its recklessness; the fact that, in immediate sequence to the recent rate decision, the company has borrowed twenty millions at home and ten abroad, on genuinely favorable terms, proves its baselessness. No impression could possibly be made now on the public mind by another assertion from the same source, intimating that the Central's dividend need not have been reduced but for the Commerce Commission's action.

The truth of the matter is that the New York Central's dividend ought to have been reduced, and probably would have been reduced, whatever had been the commissioners' decision on railway rates, and this for the reason that the dividend was most improperly increased from 5 to 6 per cent. a year ago. That increase has since been defended by the company's authorities (in face of the fact that 6 per cent. was not in reality being earned even then, and that a season of trade reaction was plainly ahead), on the ground that high dividends were necessary to preserve the company's credit.

There was this much of excuse for it—that the bond market of a year ago had become decidedly unreceptive to new railway loans on the former terms. Most people conversant with financial matters found the cause in the money market itself; but the fact itself was disconcerting, and it was possible at

least to argue that, if earnings and dividends were larger, the lending community would be more complacent. To jump from this assertion, however, to the further inference that to increase dividends when earnings were not increasing, and to pay out to shareholders money which was needed for the property, would make a company's creditors enthusiastic, was to overstep the line of outright absurdity. The best that can now be said is that, with the return of the money market to more normal conditions, these strange vagaries are in the way to disappear.

THE GREAT EPIC OF ISRAEL

By AMOS K. FISKE
Author of "Myths of Israel."

12mo. Cloth. $1.50 net

This book is a brief, clear, popular account of the Hebrew scriptures treated as literature. The sources and growth of the "Old Testament" are clearly traced in the light of the latest special scholarship. The general reader, to whom the work is especially addressed, will find it a comprehensive guide to a right understanding of the Jewish scriptures.

31 WEST 23D STREET. NEW YORK

Love and Marriage
By Ellen Key
Author of "The Century of the Child," etc.
Crown 8vo. $1.50 net.

A discussion of the problems the most vital to the welfare of the human race, problems which have throughout the centuries engaged the attention of leaders of thought. Daring and iconoclastic as they may be, the views of Ellen Key are presented with a calmness and philosophy of method that is absolutely free from any trace of sensationalism.

"In **Love and Marriage** *we feel that we are in the inspiring presence of a woman whose personality is one of the chief moral forces of our time."*—**Havelock Ellis.**

G. P. PUTNAM'S SONS, NEW YORK & LONDON

MOFFAT, YARD & COMPANY BOOKS OF REAL IMPORTANCE MOFFAT, YARD & COMPANY

THE WORLD OF LIFE

A Manifestation of Creative Power, Directive Mind, and Ultimate Purpose

By ALFRED RUSSELL WALLACE, O.M., F.R.S., D.C.L.

8vo. $3.00 *net*. *By mail*, $3.30.

"The impressive importance of the book," writes William Roscoe Thayer, of Harvard, "lies in the author's deductions. These I read with great interest and with such competence as anyone may have who has been reading for thirty years the various solutions to the cosmic riddle which philosophers and men of science have been putting forth. As a demonstration of 'all's for the best,' that life is a progress upward, with the implication that this view involves, Wallace's book is certain to make a deep impression. He cannot prove immortality, but he is right in insisting that, if his premises are correct, immortality must follow. . . . So, too, in regard to the mystery of pain, Wallace's theory will have to be reckoned with. It is his fundamental contention that life is not created by matter but expresses itself through matter."

THE INTERPRETATION OF HISTORY

By MAX NORDAU 8vo. $2.00 *net*. *By mail*, $2.18.

CONTENTS

I.—History and the Writing of History.
II.—The Customary Philosophy of History.
III.—Anthropomorphic View of History.
IV.—Man and Nature.
V.—Society and the Individual.
VI.—The Psychological Roots of Religion.
VII.—The Psychological Premises of History.
VIII.—The Question of Progress.

This closely-reasoned work will make a strong appeal to all thoughtful students of history and philosophy. Beginning with the proposition that history is only to a small extent included in written history; that written history is not scientific; that it is not descriptive; that it provides no knowledge; that it does not help in the struggle for existence; that it corresponds with no natural requirements of the human mind; that, in a word, its practical purpose is to oppress and deceive the present with the assistance of the past; the celebrated author, by a brilliant and convincing cumulation of reasoning, concludes that, behind all appearances and all delusions, the real meaning of history is found to be the manifestation of the life force in man.

BASSET, A Village Chronicle

By S. G. TALLENTYRE

Author of the "Life of Mirabeau," etc.

12mo. $1.25 *net*. *By mail*, $1.37.

A novel of exquisite quality, told in brilliant pictures. Scene, rural England.

SONNETS FOR CHOICE

By MARGARET CHANLER ALDRICH

12mo. $1.00 *net*. *By mail*, $1.10.

"Depth of thought, breadth of vision, and lofty imagination are given the freest play. . . . It is something to have carven sonnets in fine gold."

San Francisco Chronicle.

GRAY DAYS AND GOLD

By WILLIAM WINTER

Uniform with "Shakespeare's England." *Large 8vo. Elaborately illustrated. Boxed*, $3.00 *net*. *By mail*, $3.30. This is much more than the celebrated book of many editions under this title. It is almost wholly rewritten and largely new.

HOUGHTON MIFFLIN COMPANY'S
IMPORTANT SPRING BOOKS

THE FACE OF THE FIELDS
By DALLAS LORE SHARP

Amusing sketches on outdoor subjects by one of the leading American nature writers.

The papers have the same qualities of pleasing style and genuine feeling that mark his earlier book, "The Lay of the Land." $1.25 *net.* *Postpaid* $1.35

The Boston Advertiser says: "His humor is healthy and so is his sentiment. Such papers as 'The Scarcity of Skunks,' 'Getting Eggs for Agassiz,' and 'The Face of the Fields' are at once wise and entertaining."

NEW FICTION

JEANNETTE MARKS'S
The End of a Song

A novel of simple Welsh life, told with humor and pathos, by the author of *"Through Welsh Doorways."* It will help to do for Wales and her people what Barrie did for the common folk of Scotland. *With frontispiece in color. $1.15 net. Postpaid $1.26.*

GARDNER TEALL'S
The Contessa's Sister

The diverting love affairs of a rich young American and a German Baron while sojourning upon the Island of Capri. *$1.20 net. Postpaid $1.31.*

MARY C. E. WEMYSS'S
People of Popham

Mrs. Wemyss, whose "Professional Aunt" proved so successful last year now enters a larger field. Peggy, the charming and witty girl who is supposed to tell the story, will win a place in the affections of a wide circle of readers.

$1.20 net. Postpaid $1.31.

KATE DOUGLAS WIGGIN'S PART IN
Robinetta

A delightful English pastoral romance by the authors of "The Affair at the Inn."

"The internal evidences of the happy style of Mrs. Wiggin are many."—*Boston Globe.*

With frontispiece in color. $1.10 net. Postpaid $1.19.

J. SMEATON CHASE'S **Yosemite Trails**

An ideal travel book for the tourist in the Yosemite, describing the scenery, forests, and wild-flowers. Illustrated from photographs.

$2.00 *net.* *Postpaid*, $2.14

WILLIAM BURNET WRIGHT'S **The Heart of the Master**

Professor George L. Kittredge, LL. D., Litt. D., of Harvard University says of this book: "I find the book most interesting and impressive. The discussion of Passion Week is original and powerful. I speak, of course, as a layman, and under the correction of my betters, but to my mind, Dr. Wright has illuminated the darkest problem in the New Testament."

$1.25 *net.* *Postpaid*, $1.36

WILLIAM J. TUCKER'S **The Function of the Church**

Former President Tucker of Dartmouth discusses here a question which concerns the thinking men and women of every community and points to their part in the religion of the future.

50 *cents net.* *Postpaid* 55 *cents*

WILLIAM ELLIOT GRIFFIS'S **China's Story**

The history, legends, literature, art, religion, and modern development of the oldest empire in the world written for young people. Illustrated.

Morphology of Gymnosperms

By JOHN M. COULTER and CHARLES J. CHAMBERLAIN

This work is a revised and enlarged edition of the book brought out by Professors Coulter and Chamberlain in 1901. Each of the seven great groups is here presented in detail, and a final chapter discusses the problem of phylogeny and points out the evolutionary tendencies. The extinct groups, notably the primitive "seed ferns," are now included for the first time; and vascular anatomy is fully recognized as a morphological subject of first importance. The entire presentation is thoroughly and systematically organized and arranged with a view to the greatest possible clearness. The illustrations are numerous and in large part original.

470 pages, 462 illustrations, 8vo, cloth; postpaid $4.22

NOW READY

A MOST IMPORTANT CONTRIBUTION TO HISTORICAL WRITING

The Records of the Federal Convention of 1787

Edited by Professor MAX FARRAND, of the Department of History, Yale University

This great work is a complete collection of all the important accounts of the proceedings of the Convention which framed the Constitution. Because of the wealth of new material gathered by the Editor and the accurate and authoritative inclusion of all known accounts carefully collated at first-hand, the present exhaustive work must forever supersede all previously published accounts.

No other publication can enable one to comprehend so fully the spirit of the Constitution as will "The Records of the Federal Convention."

That there is a recognized need for this great work is best indicated by the fact that a Limited Edition of 250 Sets on large paper was over-subscribed as far in advance as last December, and that at the present writing over 50% of the first two printings has been sold.

Among the Libraries subscribing in advance the following may be mentioned:

Public Library of Boston, Mass.
Public Library of Worcester, Mass.
Public Library of San Francisco, Cal.
Public Library of Bangor, Maine
Public Library of Syracuse, N. Y.
and others.

State Library of Connecticut
State Library of New York
State Library of New Hampshire
State Library of Nebraska
State Library of Maryland
State Library of North Dakota
State Library of Mississippi
State Library of Oregon
State Library of Rhode Island
State Library of Virginia
State Library of Washington
State Library of Wyoming
and others.

Minnesota Historical Society
Massachusetts Historical Society
Legislative Library, Toronto
Harvard Law School Library
Yale University Library
Princeton University Library
McGill University Library
Amherst College Library
Radcliffe College Library
University of Texas Library
Vassar College Library
University of Michigan General Library
University of Pennsylvania Library
Haverford College Library
Ohio Wesleyan University Library
State University of Iowa Library
University of Kansas Library
and many others.

An admirable feature is the exhaustive general index, which is supplemented by an index to the clauses of the Constitution.

Mechanically the work is worthy of its subject, and is printed from clear type of good size, on paper of excellent quality. The three volumes are handsomely and durably bound in brown buckram, gilt top, substantially boxed.

A complete circular of the work will be sent on request.

Librarians whose appropriations are temporarily exhausted but who may wish to avail themselves of the work are invited to correspond with the Press as to terms of payment.

Library Edition, three volumes, royal octavo, sixe 6¾@10½, each 650 pages, bound in buckram, reënforced back, $15.00 net, carriage extra.

135 Elm St., New Haven, Conn. **YALE UNIVERSITY PRESS** 225 Fifth Ave., New York

(Four Impressions)

THE CHRIST MYTH

By ARTHUR DREWS, Ph.D.

Professor of Philosophy at Karlsruhe

This book is an able attempt to show that the origin of Christianity can be accounted for without the assumption of an historical Jesus. By a comparison of the myths current in the early Christian period with the Pauline Epistles and the Gospels the author reaches the conclusion that Jesus was not a historical figure, but the suffering God of a Jewish sect, to whom the metaphysical speculation of St. Paul gave universal significance.

As a scientific and well-documented study in comparative religion the work is likely to be of much interest, even to those who are not able to accept the author's more extreme views.

"'Die Christusmythe,' by Arthur Drews, has stirred the heart of Protestant Germany and roused it into keen opposition. It is an esay in Christian mythology on lines similar to those followed in Mr. J. M. Robertson's 'Pagan Christs' and 'Christianity and Mythology.' Only faint echoes of the controversy which Drews has called forth have reached our shores, but with the appearance of an American edition his book is not unlikely to become a storm centre of Christian thought here as elsewhere."—*The Inquirer.*

Five Hundred Action, and Practical Experts

Complete publication of the Eleventh Edition will soon be reached; the first 14 volumes are in the course of delivery

SIXTY-FOUR ENGLISH AND AMERICAN EDITORS TO PRODUCE THE

Britannica (11th Edition)

The last completely new Edition of the Encyclopaedia Britannica was the Ninth issued volume by volume from 1875 to 1889.

The value of the Encyclopaedia Britannica as a final authority in all matters of learning is paralleled by its usefulness as a practical work of reference in emergencies. Its comprehensive character in this respect is reflected in the following classification of the contributors:

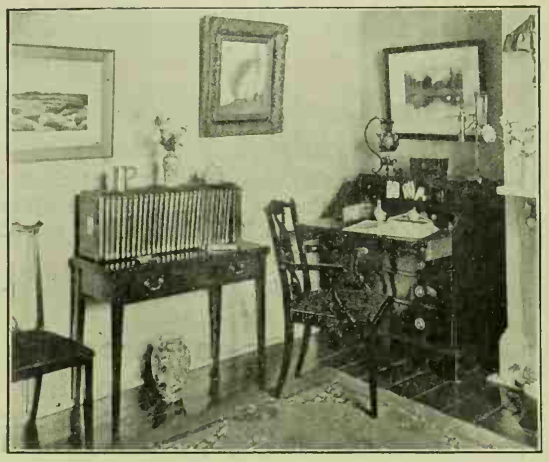
BY PROFESSIONS OR OCCUPATIONS

Historians and Archaeologists	327
Sociologists and Economists	72
Geographers and Explorers	64
Biologists and Agriculturists	107
Mathematicians, Physicists, and Chemists	93
Geologists, Astronomers, and Meteorologists	65
Ministers, Diplomats, and Government Officials	126
Theologians	161
Lawyers	75
Physicians and Surgeons	75
Engineers and Architects	73
Business Men and Manufacturers	62
Naval and Military Officers	79

To grasp at first thought the varied utility of so vast and original a work as the Eleventh Edition of the Encyclopaedia Britannica is impossible. In its general character it has been aptly described as a "section of the trunk of the tree of knowledge as it stood in the year 1910," and to consider the obvious uses which an intelligent reader will make of such a resource is to look ahead for years.

Yet unless the question of the price is altogether to be disregarded, the decision to examine the details of the present limited offer with the idea of becoming a subscriber on the most favorable terms possible must be immediate.

The present occasion is in fact of the nature of a double opportunity. By subscribing at once the reader will (1) receive the benefit of the "advance of publication price," (2) obtain early delivery of his set.



The 29 volumes on India paper occupy little more than two feet of space, and may be placed on top of a small table or a desk.

$4.00 A VOLUME

is the before-publication price for the Cloth-bound copies on ordinary paper (each volume being a large quarto, of from 960 to 1,060 pages, and containing an average of 1,500,000 words), and $4.25 is the price for India paper, bound in Cloth (each volume but 1 inch thick), and containing exactly the same contents.

To be Increased to $7.50 a volume

It is intended that after May 31st the price shall be increased, the first increase to go into effect from that date, and the work will continue to be sold on an ascending scale of prices of which the ultimate price will be $7.50, the same as that of the 9th Edition.

Terms of Payment

The cash price (at the special rate of $4.00 a volume for ordinary paper, and $4.25 a volume for India paper) may be paid in full, or at a slight increase may be divided into 4, 8 or 12 monthly payments. Payment will also be accepted in monthly instalments of $5.00 only.

Illustrated Prospectus (40 pp.), 56 specimen pages on India paper, 4 specimen plates, and form of application showing the special advance terms, will be sent by return of post if the reader will write name and address below, tear off this corner and post to

Important New Macmillan Books

THE BEST NEW NOVELS

Gustav Frenssen's *great novel*
Klaus Hinrich Baas

THE STORY OF A SELF-MADE MAN.

"One of those rare novels so veracious, so packed with the veritable stuff of life, that it is a genuine human document—true, and also universal."—*Milton Bronner.*

Cloth, $1.50.

Trevor Lordship
By Mrs. Hubert Barclay

is an absorbing story in that most charming of settings, the social life of English house-parties. There is something about the book that is exceptionally pleasing.

Cloth, $1.20 *net; by mail,* $1.32.

Josephine Daskam Bacon's
While Caroline was Growing

As amusing and human a book to chuckle over as her "Biography of a Boy" or "The Madness of Philip."

Illustrated. Cloth, $1.50.

The Justice of the King
By Hamilton Drummond

Colorful, exciting, altogether charming in its atmosphere of adventure, song, youth, and tender love-making.

Cloth, $1.20 *net; by mail,* $1.32.

Jack London's *new novel*
Adventure *Now ready*

The book is vividly imaginative; one feels the strain of tropic heat and the tension with which white men hold the mastery of the Southern Seas, as keenly as one felt in "Burning Daylight" or "The Call of the Wild" the iron grip of the Arctic cold.

Cloth, $1.50.

C. G. D. Roberts's *new book*
Neighbor Unknown

is keenly interesting, and has at the same time a refreshing element of out-door life. The stories are of animal life under widely varying conditions. *Illustrated. Cloth,* $1.50.

READY NEXT WEEK

The Colonel's Story
By Mrs. Roger A. Pryor

By the author of "My Day," "Recollections of Peace and War," etc.

Cloth, $1.20 *net; by mail,* $1.32.

Wandering Ghosts
By F. Marion Crawford

It is odd that the final volume added to the shelf of Mr. Crawford's novels should so uncannily force one to sense the supernatural.

Cloth, $1.25 *net; by mail,* $1.35.

Professor **Irving Fisher's** *new book*
The Purchasing Power of Money

An explanation of the causes of the recent increase in the cost of living. It touches a live subject to which it will be found a most valuable contribution by all students of the fluctuations of prices between 1896 and 1909.

Cloth, 8vo, $3.00 *net; by mail,* $3.20.

Professor **L. H. Bailey**
The Outlook to Nature

A new and revised edition.

Cloth, $1.25 *net; by mail,* $1.34.

Professor **Patten's** *new book*
The Social Basis of Religion

By SIMON N. PATTEN, Ph.D., LL.D., Professor of Political Economy, University of Pennsylvania, author of "The New Basis of Civilization," "The Development of English Thought."

Cloth, 12mo, $1.00 *net; by mail,* $1.10.

Professor **William Lyon Phelps's**
Essays on Russian Novelists

By the author of "Essays on Modern Novelists," which, as the *Baltimore Sun* expresses it, established his reputation as "an academic critic without academic superstitions."

Cloth, 12mo, $1.25 *net; by mail,* $1.35.

Published by THE MACMILLAN COMPANY 64-66 Fifth Ave. N. Y.

The Nation

NEW YORK, THURSDAY, MARCH 23, 1911.

The Week

Mr. Roosevelt has now brought to a close his series of articles in the *Outlook* on the New Nationalism and the judiciary. The most notable thing about them is that nobody has found them notable. They have neither been quoted nor commented upon in the press, so far as we have seen, and may be said to have fallen like a snow-flake on the stream, a moment white then gone forever. This is, no doubt, a sign of popular fickleness and shows how easily a man who drops the Big Stick is himself dropped by the public. But it is a good deal of a pity, none the less, for in these articles Mr. Roosevelt has written with more moderation and good sense than he has accustomed us to expect from him. His main object has been, as he intimates, to endeavor to dissipate the feeling of "many good men" that he had made "improper" or "revolutionary" attacks upon the Supreme Court; and he closes with hearty expressions of regard and even veneration for the courts. He would do nothing to hurt their "usefulness" or "dignity." Hence, he announces, he is against the "recall" of judges. And, indeed, his speech at Phœnix on Monday was nearly as strong against this measure as was Mr. Wickersham's at Cleveland. The reasons advanced by both were much the same. It is true that Mr. Roosevelt is for letting Arizona have her way, even if it be foolish, while Mr. Wickersham would apparently favor keeping her out of the Union until she made a less freakish Constitution. Thus far the discussion is largely academic, but the matter may take practical shape in the extra session of Congress when Arizona again knocks for admission as a State.

The report that the War Department is taking advantage of the mobilization in Texas to work out a plan for a reorganization of the stations of the army, with a view to assembling it permanently in larger units, is by no means surprising. From the beginning of the movement some officers of rank and experience have expressed the wish that the troops might never come back from Texas—by which they meant simply that they hoped for the establishment of a divisional camp in which general officers could be trained in the handling of large bodies of men. Under our system, since the passing of the civil war veterans, colonels have become generals who had never even drilled an entire regiment, much less a brigade. In the Continental services an officer is not promoted until he has demonstrated on the drill-ground that he can satisfactorily handle the larger unit to which his advancement would carry. If he is a general and blunders during the manœuvres, his retirement is immediate. Some years ago an effort was made to examine officers more practically at Forts Leavenworth and Riley before promoting them than was the case previously, but the exigencies of the service have interfered a good deal, and, moreover, no officer is examined for promotion who is above the rank of captain.

The conviction and sentence at Albany of a woman who had killed her five-year-old son may well serve to point a moral in relation to the proposal to abolish the insanity plea. After a decent and orderly trial, occupying nine days, the jury found the woman guilty of murder in the second degree, rejecting the plea of insanity which had been set up for her; and the judge sentenced her to imprisonment at hard labor for not less than twenty years. What would be the effect upon the public mind of such a sentence if the law had prohibited the making of that plea? It is doubtless true that under the changed law an inquiry as to the present mental condition of the woman would have been provided for; but on the supposition that she had not been found insane and committed to an asylum, she would have been tried before a jury required to pass judgment upon her act without being permitted to make allowance for the possibility that she was mentally irresponsible when she committed the act, or to hear any evidence bearing on that question. Manifestly, the consequence would have been either a conviction which would arouse a vast amount of not unreasonable sympathy with the condemned woman, or an acquittal obviously flying in the face of the evidence that was permitted to reach the jury. In either event, the result would have been demoralizing.

The first step in the reorganization of the Democratic party in Pennsylvania has been successfully taken under the leadership of Vance C. McCormick, the former Mayor of Harrisburg. At the meeting last week of the reorganization committee of seven, by a four to three vote, James M. Guffey was removed as National Committeeman and Arthur G. Dewalt as State Chairman. Congressman A. Mitchell Palmer was chosen to take Guffey's place, and ex-Mayor George W. Guthrie of Pittsburgh, whose excellent administration of that city is still remembered, became State Chairman. Of course, the Old Guard is highly indignant. One of its spokesmen burst out with, "You are trying to crucify people," to which the natural retort was that, under the leadership of Guffey and Dewalt, "the party has been crucified," losing 325,000 votes it ought to have had at the last election because of mismanagement and a total lack of popular confidence in the Guffey kind of politics. The Pennsylvania Old Guard is talking of legal procedure to prevent the reorganization that everybody sees must come unless the Democratic party is to be smashed and a new one arise to take its place. The present situation is absolutely intolerable, but with men like McCormick, Guthrie, and Palmer leading, the prospects are that there will be a thoroughgoing reorganization. New York Democrats who have seen the rehabilitation of their party blocked by the Governor's weakness can at least comfort themselves by watching the gains made in New Jersey and Pennsylvania.

In an address at Harvard last Monday Dr. Eliot showed that a big man will admit a point made against himself. Dr. Eliot's subject was Diversity in Family, College, and State. Let it be recalled that the former president of Harvard has been the best known exponent of one form of collegiate diversity that goes under the name of the elective system. Let it be recalled that with the advent of President Lowell the elective

system has come under heavy fire. Did Dr. Eliot make an opportunity to defend his own views on the subject? Did he resort to the ambiguous mixture of praise and censure with which another ex-President has been making difficult the path of another President? This is what Dr. Eliot had to say:

> At one time Harvard had a prescribed course, yet it did not produce a uniform scholar. The amount of time required to attain possible marks was not nearly as much as required now, yet such scholars as Emerson, Lowell, and Norton were produced, for the reason that they gave one-tenth of their time to the prescribed course and nine-tenths to the study of what they liked. The prescribed course has no tendency to produce a uniform grist, and it is a mercy that it does not.

If anybody thinks that it is easy to stand up in public and say pleasant things in behalf of a policy that sharply differs from one's own, he should be invited to try it. A high degree of moral courage and a high degree of intellectual honesty are the prerequisites.

The old battle for freedom of speech and thought is on in a sturdy and valuable Southern institution, Roanoke College. For some years past it has been using Elson's "History of the United States," which, after picturing the bright side of slavery, speaks of the dark one, notably of the illicit relations existing between masters and their slaves. It also describes the civil war as a "slave-holders' rebellion." This fired the blood of some loyal ex-Confederates and the usual hue and cry is heard in the land. There is no effort by the critics to ascertain by scientific inquiry whether the facts stated are true or not; no, the book must go on the South's Index Expurgatorius as surely as any book attacking the Catholic Church goes on the Pope's; and if Roanoke does not abolish its use, there are those who say that it will suffer severely. This we can hardly believe. Roanoke College has long held an honorable position in Virginia and performed a useful service. It has hosts of good friends North and South, and we cannot believe that the sober common sense of Virginia will permit it to be muzzled by irresponsible public clamor, or that the intelligent South wishes to lay down the principle that its children can read only such histories as commend themselves wholly to those who hold one preconceived idea or another. The trustees have sustained the professor who prescribed the text-book in question and also the principle that a full professor may select his own text-books, and the faculty has also upheld their colleague in some vigorous resolutions. There can be but one outcome to such a contest. Freedom to read and think and to use such sources as he deems best are essential to every professor. If this principle cannot be sustained Roanoke should close its doors.

Regarding the tragic error that was made in the sentencing of a Hungarian miner in Pennsylvania nearly twenty years ago for a murder which it is now shown he never committed, it is worth while to note that his conviction was not due to circumstantial evidence. The wrong man was sworn to by professed eye-witnesses. There is no difference whatever between the evidential value of circumstantial evidence as such, and so-called direct evidence as such; it is all a matter of the convincing character of the particular evidence in the particular case in hand. Another reflection that is worth making is that in all probability, in this poor man's case, there was not enough care taken in the trial that the case be thoroughly proved in substance; it is doubtless a natural correlative of our preposterous magnification of purely formal and factitious points in some cases to attach less than their natural weight to substantial points in others. As for the deeper human elements in the story—the terrible sufferings of the poor man and his family, and the way in which he was sustained by his religious faith—upon these comment would be vain.

Col. William F. Cody's ambition to be United States Senator from Arizona is primarily justified by the fact that if Buffalo Bill is not elected, some millionaire mine-owner of the Guggenheim type will be. That, however, is only a negative consideration. Affirmatively, it may be argued that a State with a fine, free, wild Constitution like the one Arizona has just adopted would most properly be represented by so notable an exponent of the fine, free, venturesome life of the open. The effect of Col. Cody's presence upon the Senate itself could not help being of the very best. The insurgents have done something to agitate the rather torpid atmosphere of that solemn chamber, but Buffalo Bill's arrival would be like a veritable sea-breeze in the top-floor bedroom of a board-walk hotel on a night in August. Not that he would fail to find friends in the Senate right from the start. The mind's eye calls up, for instance, a pleasant picture of Col. Cody "swapping" stories with Mr. Root, one telling how easy it is to shoot glass balls from horseback, and the other telling how easy it is to prove that the best way of retiring a man from public life is to vote for him. But the possibilities are really unbounded.

Not the least remarkable circumstance connected with Sir Edward Grey's speech in favor of international arbitration and against the mad competition in armaments is the friendly reception it has met with in Germany. When a semi-official note of the German Government declares that Germany is ready to join in an agreement which may tend to overcome English popular mistrust, and when the speech of the British Foreign Secretary that calls forth this response was itself the strongest kind of evidence that that mistrust has been rapidly subsiding, things are in a very different position from that in which they stood quite recently. It begins to look as though the inflaming of the idea of a manifest-destiny war between England and Germany, which had been going on with increasing intensity for perhaps half a dozen years, reached its acme about two years ago, and that since that time there has been a gradual but steady return to a normal state of mind. And it is well worth while to remark that this is a process which has not altogether taken care of itself, but has been dependent on the specific acts and words of particular individuals and organs of opinion. The deliberate and determined opposing of the idea of manifest destiny, in such a situation as that which was brewing between the two great Germanic peoples of Europe, is just as truly one of the forces determining the outcome as are those blinder forces upon whose existence the necessitarians predicate the futility of all endeavors to mould the destiny of nations by appeals to reason or moral sense.

Never did a St. Patrick's Day dawn with such solid ground for hope of Home Rule for Ireland, or such cordial

words of confidence and good will toward England on the part of Irish leaders as the one just past. "The struggle between England and Ireland is ended," says John Redmond, the chief of the Irish Parliamentary party; "we want peace with England; we want friendship with the English people; we want our proper place in the British Empire, and to bury fathoms deep in the ocean of oblivion and memory the wrongs, the miseries, and the oppressions of the past." And William O'Brien, leader of the Independent Nationalists, while reasserting his dissent from the policy of the Irish Parliamentary party, in that he wishes to disentangle the Irish movement from the interests of the Liberal party, has no word of bitterness toward the English. The wise course, he maintains, would be to keep Ireland out of British party quarrels and bring about a settlement of the Home Rule problem "by general consent, in the better spirit which is now beginning to show itself in the Unionist party and among our Protestant countrymen." That difficulties still remain before the goal of Home Rule is actually reached, it would be idle to deny; but not only is the prospect now one of apparent certainty in a not distant future, but one that gives promise of a more favorable working of the new order than could have been looked for at a time when good feeling on both sides of the Channel had not reached its present development.

None of the statesmen who are now at the head of affairs in the countries that go to make up the European political balance was in office when P. A. Stolypin was summoned in April, 1906, to the post of Minister of Interior and President of the Russian Ministerial Council. During these five years Campbell-Bannerman has been succeeded by Asquith, Von Bülow by Bethmann-Hollweg, Clemenceau by Briand and Monis, while Austria has witnessed the emergence of Von Aerenthal. If Stolypin, the veteran of them all, has occupied a less prominent position in the public eye, it is because Russia is still not quite Europe. Another reason is that Stolypin gave himself up entirely to the great problems of domestic policy that the Revolution has left as a heritage. While the echoes of the great struggle were still to be caught, interest in Russian affairs persisted. When the work of pacification was completed and the work of legislation began, the outside world naturally lost interest. From time to time, it is true, vague rumors have reached us of a plan fathered by M. Stolypin for radically changing the economic status of some seventy-five million peasants, but economic revolutions have no dramatic appeal. At the present moment it is supposed that M. Stolypin has fallen because of fostering the old ruinous policy of aggression in the Far East. Yet his defeat cannot be called a victory for progress, since it is a personal defeat and apparently leaves unharmed the ministers who are just now engaged in strangling free thought in the Russian universities.

When the Luzzatti Ministry came into office almost exactly a year ago, it was plain that the new Cabinet would remain in power only as long as it pleased Signor Giolitti, the retiring Premier and leader of the Radical majority in the Chamber. A few days ago Giolitti decided to give the word, and Signor Luzzatti resigned. The extension of the suffrage has been the principal question before Parliament. The Ministry favored a bill that would establish manhood suffrage and make voting compulsory. To the second proposal the Radicals and their Socialist allies have been opposed. The explanation has been advanced that, whereas universal suffrage would tend to increase the Radical strength in Parliament, compulsory voting, by sending to the polls the hundreds of thousands of Catholic electors, might easily swing the Parliamentary balance in favor of the Moderates, if not, indeed, give rise to a powerful Church party. On that issue it would seem that Giolitti has decided to withdraw his benevolent support from the Cabinet. Signor Giolitti can be Premier again if he wants to; and possibly the veteran politician is not above the temptation to hold office during the coming celebration of the semi-centennial of Italian unity.

The vitality of the Triple Entente is at present being discussed with a great deal of animation. The nation most concerned is France, which of late has fallen into misgivings as to the exact value of her alliance with Russia or her "understanding" with Great Britain. The latter arrangement, as the more informal of the two, naturally invites the greater amount of speculation. It was part of Unionist tactics in Great Britain to encourage the belief that the Liberal party was lukewarm to the French *entente*. This the Asquith Ministry has denied. New doubts, however, are bound to arise as the result of a question put and answered recently in the House of Commons. Sir Edward Grey was asked whether, during his term of office as Foreign Secretary, assurances had been extended to France that in certain "eventualities" British troops would coöperate with the French army. The answer was that no such promises had been extended. As a matter of fact, if some such understanding exists between the two governments—and the common belief is that it does exist—it was arrived at during the presence of Lord Lansdowne in the Foreign Office, during the anxious days preceding the dismissal of Delcassé in 1905. In France, nevertheless, the statement of the Foreign Secretary is sure to give rise to new fears.

Rumors of an impending upset of the Portuguese Republic continue to crop up in the foreign dispatches, but do not appear to be borne out by inquirers on the spot. A special correspondent of the London *Times* has been writing of the condition of affairs in Portugal four months after the fall of the monarchy, and while he finds much to criticise, it is his judgment that "there can be no immediate question of a counter-revolution." The main reason he finds in the general satisfaction of the mass of the citizens with the new order of things. They are proud of their recently acquired political rights and very jealous for the good name of the republic. The provisional government has, indeed, been slow in settling the basis of suffrage and arranging for a general election, which was to have been held in February but is now set down for April; the announced liberty of the press and the right of free assembly are still rather aspirations than achievements; but the people as a whole are contented and are confident that everything will work out right. If this account of the actual situation is correct, there may be monarchical plottings and even occasional outbreaks, but the republic will go on.

CIVILIZATION GETTING FORWARD.

The deep impression made by Mr. Balfour's speech on arbitration in the House of Commons last Thursday was due partly to his personality and partly to his cause. His humane instincts and his philosophic looking before and after carried their own weight, while his position as leader of one of the great English parties lent double force to his words. When he rose to pledge his heartiest support to Sir Edward Grey in every effort the Government might make towards a treaty of universal arbitration between Great Britain and the United States, the cheers that broke out in the House were a tribute not so much to him for an act of political generosity as to the new era that seemed to be dawning. The actual debate was on the naval estimates; but it was felt that if a bond could be taken of fate against war between all English-speaking peoples, the voting of many millions for guns and armor would soon become a thing of the past.

Americans have a just title to pride in this English demonstration, because it was really in response to the advanced position taken by our own President. In this connection, it is a little surprising that Mr. Taft's words should have wakened a wider echo in England and on the Continent than in the United States. When he said in his speech at Washington a few weeks ago that he was ready to arbitrate every dispute that might arise between us and Great Britain, not even excepting questions of alleged "national honor," he was, of course, applauded at home, but his statement produced the most profound effect in Europe. There it has not ceased to be discussed to this day, and led to the questioning of Sir Edward Grey in the House of Commons. His full recognition of the leadership in international peace which President Taft had assumed, and the announced readiness of his Government to conclude a treaty with the United States covering every possible controversy, are gratifying sequels to the President's speech. The British Foreign Secretary stated last Thursday that Japan had been informed of the wishes and intentions of England in the matter of an arbitration treaty with America. The inference is plain that Japan could expect in a treaty of that kind no reserves, on the part of her ally, respecting a possible embroilment of her own, such as were made in the first Anglo-Japanese alliance. If this lead could be followed up, and a binding treaty of arbitration with Japan made by the United States, the peace of the world would seem to be established beyond danger of a breach, and the military obsession would cease to afflict the nations.

One has only to go back in memory as far as 1896 and 1897 to perceive what an immense advance has been made since the time of the negotiation of President Cleveland's treaty of arbitration with England. That was a most enlightened measure, but its fate showed that it was almost too much so for its time. In the preliminary correspondence between Lord Salisbury and Secretary Olney, the great stumbling-block was "questions affecting national honor." For a long time the English Foreign Minister insisted upon a clause refusing to submit to arbitration whatever, in the judgment of either country, "materially affects its honor or the integrity of its territory." Mr. Olney criticised that proposal destructively, arguing that under it any and every arbitration could be declined. The qualifying words were finally dropped, but our Senate, as will be remembered, held the matter up for months and then insisted upon making amendments which virtually destroyed the instrument and led to its abandonment. Of course, there were many political reasons for such an attitude at that time which do not exist now in equal force. The "Irish vote," for example, could not to-day be so powerful a motive with American politicians as it was fifteen years ago in leading them to oppose everything which looked to a permanent good understanding with England. But in addition to that, there has been a marked change of ideas about the whole subject. Arbitration has ceased to appear an iridescent dream. We have seen it take on living shape. The establishment of the Hague Tribunal, with the growing probability of a real international court for the judicial settlement of disputes between nations, has had the effect of introducing into many minds entirely new notions of what may be done in the world without appeal to the sword.

Lowell may have been right in saying that civilization gets forward on a powder-cart, but it gets forward more rapidly and much more securely upon a powerful civilized sentiment; and that is what we have been seeing in the process of creation. One great advantage of such debates as that in the House of Commons, and of such plans for the laying of international quarrels as are now to the fore, is that they furnish a needed stimulus to the formation of a sound and forceful public opinion. Without it, as Lincoln said, statesmen can do nothing; with it, they can do anything. And the rulers of both the United States and England may now rest assured that a great body of intelligent and determined men and women will give them the strongest support in all measures to do away with resort to the last argument of kings.

A NECESSITY OF GOOD GOVERNMENT.

The twenty-seventh annual report of the United States Civil Service Commission, for the year ended June 30, 1910, which was made public a few days ago, is very brief; and the part that is of greatest significance and importance is comprised in eight little pages near its close. We do not remember ever to have seen within the same compass a presentation of the benefits, and indeed necessity, of the merit system so well calculated to make an impression on the minds of practical men.

We say "on the minds of practical men" because it is neither by insistence on abstract doctrine nor by an array of statistics that the impression is produced. The effect is rather incidental. In the first place, the commission quotes the recommendation made by President Taft that first, second, and third-class postmasters be included in the classified service; a change which would require legislative action by Congress, since these officers are now appointed by the President, subject to confirmation by the Senate. President Taft gives the usual general reasons for this proposal—that it would take the postmasters out of politics, would relieve Congressmen of an unnecessary function, and would result in procuring greater efficiency and economy in the post offices. This, however, is natural enough, coming from President Taft, a long-time civil-service reformer; what is more striking is the following language quoted from the recent annual report of the Postmaster-General:

The highest degree of effectiveness in the

conduct of this tremendous business establishment cannot be attained while the thousands of postmasters, on whose faithfulness so much depends, continue to be political appointees. The entire postal service should be taken out of politics. The recent order of the President classifying, on the recommendation of the department, all assistant postmasters, was an important step in the right direction. As a still more important reform, Presidential postmasters of all grades, from the first class to the third, should be placed in the classified service. This action, which is earnestly recommended, would unquestionably result in a still better standard of service. The policy the department has followed for several years of reappointing Presidential postmasters with exceptionally good records has shown in a striking way the advantage of having our post offices managed by experienced officers. The old practice of making frequent changes for political purposes had a most demoralizing effect, and resulted in unwarranted expenditures due to poor management.

Thus does Mr. Hitchcock line up with a long series of practical politicians who, when confronted with the actual business problems of governmental administration, have testified as warmly to the vital necessity of the merit system as ever did the veriest doctrinaire who in ancient and now almost forgotten days was dubbed "snivel-service reformer" by the men who were in politics for what there is in it.

All along the line, there is a growing realization of the advantages of the merit system in the positions to which it has been applied, and of the need of extending it to other positions of like character in State and city governments, and even to the higher administrative posts, except such as involve questions of general policy. It is becoming the practice in the Department of Justice to appoint attorneys and assistant attorneys by promotion. And even the position of Assistant Attorney-General has in eight of the thirteen instances since the beginning of President Roosevelt's Administration been filled in the same way. As far back as 1896, Postmaster-General Wilson recommended that the four assistant postmasters-general be given permanency of tenure, pointing out in support of his recommendation that "the proper training of a bureau chief up to the point where he may have a vigorous grasp and accurate knowledge of his duties is a very costly thing for the government." The Civil Service Commission mentions that in accordance with this policy the present first and second assistant postmasters-general were promoted from classified positions in the department and that the same is true of many other high officers in other departments specified in the report. So far from there being anything like a reaction from the merit system, in the shape of favoring special exemptions, the evidence all shows that there is a steadily growing recognition of its advantages, even in offices not included under it by any legal enactment.

Alongside these tributes from the experience and the opinion of to-day it is interesting to note some citations of the judgment of great American worthies of the past. "The late mischievous law vacating every four years nearly all the executive offices of the government," said Jefferson, "introduces a principle of intrigue and corruption which will soon leaven the mass not only of Senators but of citizens." "I am for staying the further contagion of this plague," said Webster. "The tendency has been," said Clay, "to revive the dark ages of feudalism and to render an officer a feudatory." The spoils system was no integral part of American institutions, it was abhorrent to the minds of the great men who created and built up the republic; it was a rank weed which rapidly overspread the rich soil of our American opportunities. To check its growth, to keep it within as narrow limits as possible, has been one of the great tasks of American patriotism in the past forty years. That in the end the task will be completely performed no one can doubt who has confidence that our democratic republic is capable of the achievement of government as honest and efficient as has been developed out of the aristocratic traditions of the Old World. But in the meanwhile every public interest suffers from the vicious system of spoils wherever it survives. To maintain it where it can be got rid of is neglect of duty; to restore it where it has been got rid of is treason to the highest interests of the people.

THE TERRORISM OF FIGURES.

A statesman who in the old dignified days would have been described as a former distinguished Representative at Washington, but who in our own blither times goes under the terse appellative of "lame duck," recently contributed the following bit of information to the enlightenment of mankind:

> You have heard it was a billion-dollar Congress, and so it was. But do you know that it has given the best and most liberal government on earth at a cost of $10 per capita, while New York city government costs $35 per capita?

Having brought these two sums into vividly dramatic opposition, our orator might have proceeded, with equal force, to show that while the cost of maintaining the municipal bath-houses in New York city is fifty thousand dollars a year, the annual expenditure of the Imperial Court at Peking is at least one hundred times that amount. He might have laid insistence on the remarkable fact that the German Empire spends a far greater amount on her standing army than the State of Florida does on her militia. Who knows but that he might have found time to expatiate on the curious discrepancy between the number of immigrants who entered Argentina between the years 1900 and 1910, and the number of miles Commander Peary covered on the last day of his dash for the Pole? There are very few people in public life or out of it who can resist the temptation to use one row of figures instead of another, on the same principle that Mr. Weller preferred "circumwented" to "circumscribed" because it was so much more tenderer.

The remarkable attraction exercised by the science of numbers upon people who do not know how to use them, can only be explained as a form of religious awe. And like religion, many who scoff are, at heart, subject to their spell. We have a whole literature of cynical epigram concerning the futility of statistics, and we go on using statistics whenever we want to be most impressive. The case is even more peculiar than that: we continue to cite figures even when we know that they create no impression whatsoever. The point has already been made in these columns that there is a good deal to be said for the old type of college debate, which dealt with the comparative claims of Rome and Greece, Dickens and Thackeray, the fancy and the imagination, the sword and the pen. To-day our undergraduates discuss central banks and the corporation tax. Is it at all certain that the complications of international exchange are any more real to the undergraduate to-day than the meaning of Roman civilization was thirty years ago? Put aside the undergraduate; take the

adult business man or public official. The Third Assistant Postmaster-General of the United States is debating the question of magazine-postage. His argument advances, step by step, to the following lyric outburst:

> In 1910 the post office passed 15,250,000,000 pieces of mail; 282,000,000 were business letters of the government itself, 6,500,000,000 were letters which went through the first-class mail, 1,750,000,000 pieces were postal cards, 4,500,000,000 were magazines and periodicals, 2,500,000,000 were books and pamphlets, and 170,000,000 were packages weighing less than four pounds. The total cost of transporting and delivering all these was $229,000,000.

And as the orator pauses for a reply, one can almost see people turn about in their seats and nod at each other and say: "How true." It would be a bold man, who, in the face of that vast surge of statistics, should venture to deny any conclusion the orator may have chosen to deduce—that magazines should pay more, or that women should have a vote, or that reciprocity with Canada is undesirable.

All great popular leaders, all great orators and preachers, all great pamphleteers and revolutionaries have recognized the fact that the only figures that count with the average man are figures of speech. The average man will defer humbly to a row of digits and ciphers, but his heart will remain untouched. It is a truth that we should like to see more frequently recognized and acted upon by many of the sincere and able men who have given their lives to the problems of social reform. To state that 200,000 children in New York go to school insufficiently fed may not be as moving as to give a detailed and graphic account of a few concrete instances. The newspaper of to-day is filled with hundreds of thousands of everything. A hundred thousand dollars in diamonds are lost. Three hundred thousand dollars in trust-funds are looted. Five hundred thousand Chinese in Manchuria are perishing from plague and famine. Two hundred thousand dollars are paid by a Pittsburgh millionaire for an English castle during the coronation season. In this absolute welter of myriads and millions the reader's mind loses all sense of distinction between profits and plague deaths and the price of tiaras and children in the glass factories and cotton mills. Numbers have no meaning to the blasé man in the street. He will respond to the solitary vivid example, to the single flashing phrase. He will read your columns of figures and respect them, and do what Mr. Bryan or Mr. Roosevelt asks him to do.

That is why we must take issue with the new habit, a habit we have all fallen into, of stating human values in terms of dollars and cents. It really isn't very impressive to point out that every death from tuberculosis represents a loss of $50,000 to the community, or that every child over the age of two has a capital value of twenty thousand dollars. What every death from tuberculosis really means is the extinction of a human life, the blighting of living hopes, the closing of a human account which is written in nights of despair and in aching hearts. What every child over the age of two really means is an actual human life expanding to the possibilities of a Lincoln or a Florence Nightingale. The Irish 'longshoreman who ponders on the cost of shoes for his hundred thousand dollars of animated capital scampering about the room is not apt to find much comfort in statistical values.

THE HUMAN FACTOR IN MEDICINE.

Mr. Bernard Shaw's comedy presents a doctor's dilemma other than the one which forms the subject of the play. It consists in the accusation that doctors are a hideously reactionary and a recklessly radical class. How the two things can be true at the same time it possibly needs a course in Shavian dialectics to understand. But there lies the charge. Doctors, cries Mr. Shaw, (1) have always been among the last to recognize new discoveries in the science of health; they have been kicked forward along the road of progress by the boot of lay opinion. Doctors, cries Mr. Shaw, (2) have lately taken to killing us with lymphs and inoculations and all the new-fangled bacteriological machinery for which there is no justification in actual experience; they experiment in human lives with as little conscience as the chemist experiments in dead matter. This double-barrelled accusation exemplifies the doctor's ancient dilemma. The world counts only by results. When the doctor has failed to cure he is either criminally slow if he has been deliberate, or he is criminally reckless if he has decided to take chances. In either case men have found the fundamental reason to be that doctors are at the best a hardened lot and at the worst an unscrupulous lot.

The simplest way of meeting the charge is simply to deny the truth of it. There may be physicians who have grown hardened to the meaning of suffering and death. But it is just as true that there are physicians for whom these awesome facts have never lost their sting. There may be surgeons who will cut off your leg with a rather small display of conscience. But there are surgeons who leave at the operating table a goodly amount of their own nervous and mental energy. It is the old story of generalizing about a class to the injury of the individuals who compose it. Since the beginning of time men have scoffed at those whom they have placed in authority over themselves. The priest, the physician, the philosopher, the judge are the traditional meat for the satirist; and always the priesthood has been made responsible for wicked priests, medicine has had to bear the odium of unskilled or unscrupulous physicians, philosophy has been saddled with the follies of crack-brained philosophers, and the law has suffered at the hands of the unjust judge. This is so ancient a commonplace that it would not bear repeating to-day if it were not that the doctor's business at the present moment is under heavy fire. Every new triumph claimed for medicine elicits a denial of medicine's old triumphs, or a denial of medicine's claims *in toto*. While one part of the world is waiting for a tuberculosis lymph, another part denies the value of the diphtheria anti-toxin. While the surgeon is steadily ploughing his way into the innermost organs of our body, Mr. Shaw steps out and says that surgeons cut off people's legs because they really don't care whether people keep their legs or not.

Now this charge of inhumanity aimed at an entire class is the reverse of the true explanation. If the surgeon cuts off your leg when he shouldn't have done so, any fair-minded man will admit that the chances are, not that the surgeon is so far above ordinary human weaknesses as not to care a snap whether he cripples you or not, but that he is so little above human weaknesses as to have made a mistake. That again is a hoary commonplace that we choose to overlook. When you place your body and your life in the surgeon's hands, you

do not, and cannot, demand a guarantee against human fallibility. You hope, and that is all you can do, that the specialist's brain will be in its clearest mood that day, that his eye will not waver, and his hand be true. If one believes that life is altogether too precious a thing to place in the power of a fallible being, that is a comprehensible position. But once you decide to seek relief at the hands of a human being, you cannot demand superhuman results. The Christian Scientist is logical. But Mr. Bernard Shaw, in sneering at the doctors' mistakes, only presents an interesting combination of anarchistic distaste for authority with the primitive man's fear of witchcraft. The Russian, Hindu, or Chinese plague sufferers who riot against the doctors that have come to poison them, as the belief goes, are essentially at one with Mr. Shaw.

Within the ranks of medicine, one will find enough food for just criticism, from minor negligence to rank incompetency. One is at liberty to believe that there are very many bad doctors. The thing one must not do is to take the bad physician as the type. And the second thing one must do is to make allowances for even the very best of the good physicians. How far we are bound to go in making concessions to human fallibility constitutes the crux of the problem. In this country and abroad, courts have of late years held the surgeons responsible in a few cases where a surgical instrument or sponge was left behind in the abdominal cavity. In France some of the most eminent surgeons have protested against such action by the courts, on the ground that it saps the surgeon's confidence in himself. On the other hand, there is no reason why a special attendant in the operating-room should not be charged with the duty of seeing that just such mistakes do not happen. Here is ground for debate, because the matter is one of detail. Courts and legislatures can compel the physician to master his art before he begins to practise it; but no court or legislature can force him to rise above his human limitations.

A SIGNIFICANT LITERARY PRIZE.

At the meeting of the French Academy on March 2, it was decided to found a new "Grand Prix" in literature. Its amount is $2,000, and it is to be conferred annually upon the author of a book which has been published within the two preceding years. The work thus recognized and rewarded is to be a novel, or any other imaginative prose writing, provided that it is "d'une inspiration élevée." Light upon the purpose of the new prize was cast by the discussion at the session of the Academy. The step was proposed by M. Thureau-Dangin, permanent secretary, who first pointed out that the Academy was deficient in prizes for successful writers of fiction. Ample encouragement had been provided for orators, poets, historians, and critics, but novelists, though they were freely admitted to membership in the Academy, had thus far gone without special recognition of their art. It was partly to redress the balance, therefore, that the new prize was to be offered; but there was also the hope that it would help to "ennoble" that branch of literature, and to put a premium upon rare quality instead of upon vulgar grossness or a tiresome output of mediocrity.

That such a prize should be established by such a body is certainly not a displeasing sign of the times. Following the Nobel literary prize in emphasizing elevation of sentiment and breadth of treatment, it witnesses to a wholesome, and, we are glad to think, an ever recurrent, craving of the human spirit. Man shall not live by realism alone, or local color, or human documents, or sex problems. The imaginative touch must be there, the quickening aspiration, or readers will, in the end, turn away unsatisfied. What is here involved is no mere question of literary form. Styles change in writing, and once gone by do not come again. No one would think of writing historical novels now in the literary manner of Scott. If an author were to-day to detect himself falling into any of the literary artifices of Dickens—especially his pumped pathos—he would be alarmed, or would laugh in his own face. The oratorical and sometimes almost pompous style of Hugo, no writer would now think of trying to imitate. But it is not proposed to revive the methods of the novelists we have just mentioned; it is, rather, their large range, their dealing with life in broad sections, their appeal to the imagination of their readers—in a word, their idealism—which it is hoped may be re-incarnated in the romancers of a later generation.

To some, the peculiar significance of the Academy's new literary prize will lie in the fact that it is of French origin. The unpleasant connotation of the word "French," in connection with modern fiction, has unfortunately too much to justify it, but it would be a huge *bêtise* to infer that the idealistic strain is not known in French literature to-day, or is not sought for and delighted in by the French people. As long ago as the time of P. G. Hamerton's residence in France he pointed out that it was as foolish to judge of French morality as a whole by the superfluities of naughtiness on exhibition for foreigners in Paris, as it would be to conclude that all the Chinese are like the coolies who overflow from Canton. The republic has her full share of sweet-natured citizens capable of being stirred by the purer sentiments. It is to an ideal side of the French character and civilization that Henry James must have referred when he said that he knew that French ideas of life were very "wicked," but he should so like to see them spread into more proper nations that he might mention. And if any one doubts whether the French can respond to the finer appeals or know how to appreciate poetic imaginings, let him consider the case of Rostand. In the midst of all the exaggerations about this writer, all the *réclame*, it is impossible not to see how deeply the French were longing for a great national poet, and that they are as little content as the rest of mankind to go on always filling their bellies with the husks that the swine did eat.

There are evidences in plenty that an informing spirit and a lifting idealism in literature are as much in request to-day as ever. The very weariness with the other thing, which is so often observed, testifies to the thirst unslaked. We have nothing scornful to say of the minutely analytic method of novel-writing, separating out its heaps of fact; but one keeps on asking for the spark of imagination struck out in the dead matter. There is no objection in itself to the kind of literary artistry that turns a blaze of light upon a few small fixed points in human character; but one catches himself turning away from all the matter-of-fact glare to look for a gleam of that light which never was on land or sea. It is the writer of deep sympathies and outlook not hem-

mod in and the imaginative touch who, after all, produces the kind of book which we can take down from the shelf for repeated re-reading, and find in it the balm and refreshing and enrichment which it is the province of great literature to bestow. And if now and then the committee of the French Academy can find an author worthy of its Grand Prix because he has been inspired loftily in his work, it will be a comforting proof that the race does renew itself in love of the things that make for purity and the highest life of both intellect and spirit.

RECENT GERMAN FICTION.

Among the new novels that have appeared in Germany, Clara Viebig's "Die vor den Toren" (Berlin: Egon Fleischel & Co.) commands attention because of the period in which the plot is laid. The story opens on the day when the German army is returning from the battlefields of France, and the roads about the capital are thronged at daybreak with crowds hurrying toward the gates to witness the solemn welcome of the victors. Among them are families that have for many generations past lived on the farms clustering about the Templar castle, that castle which gave the present suburb its name, Tempelhof. The author makes us feel the fever of speculation which spreads throughout the country and in Berlin demands extension of the city's boundaries. The boom in suburban real estate seals the fate of the rustics, and when their lands are laid out in building lots, the taverns are crowded with *déracinés*. For the change that came over Berlin when the French milliardes poured into the empire, involved not only economic conditions of society, but the moral status of its individual members. The metropolis devoured and corrupted everything that came within its reach, and the weakening of rural families, with which the story is concerned, was typical of the people, high and low.

Wilhelm Poeck's "Simon Külper's Kinder" (Imported by Lemcke & Buechner) is a story of superstition in a town of fisher-folk on the North Sea. The wife of Simon Külper lives under the delusion of having trespassed against the seventh commandment, and believes that the loss of several of her children is the penalty of her sin. The plot is concerned with the surviving children and centres in the love of the daughter for the son of the man whom the father finally suspects as the destroyer of his happiness. But the strong dramatic undercurrent is furnished by the mother's remorse and the father's suspicion, until the woman's death-bed confession relieves her of her evil dream. The unusual theme is discreetly handled and the characters strongly portrayed. Bernhard Kellermann's "Das Meer" (Berlin: S. Fischer) is another story of the seashore. The author's feeling for nature and his deep insight into the souls of sea-faring people remind one of Knut Hamsun's similar stories. Kellermann's hero is a man who in his desire to return to nature has settled on a Breton island near Brest and plunged with zest into the life about him, sharing with his illiterate neighbors their pleasures and their loves. The girl whom he wins from his friend is a type popular with the ultra-modern German: an unpolished product of nature, of uncurbed animal instincts, and primitive passion. The atmosphere is breezy and briny, and fraught with ancient sea-lore.

An unusual book is Jakob Schaffner's "Konrad Pilater" (S. Fischer), the record of a quest for the unknown. The hero is a young shoemaker who starts out upon his journey with a satchel containing his tools, his clothes, a mouth-organ, a novel cut out of a newspaper, and some verses written by himself, and, after an adventurous trip through the valley of the Rhine and the Moselle and an excursion into France, settles in an Alsatian town. The friendship of a wayfarer like himself and the love of his employer's daughter furnish the emotional element of the story. Oskar Loerke tells in "Der Turmbau" (S. Fischer) another story of lives swayed by indefinite longings and irresistible desires. Against the background of a beautiful old cathedral in a North German city, his characters stand out strongly. There is a blind hotel-keeper, who, though living in physical darkness, radiates light upon those about him; there is a tile-burner who in the fires of his kiln nurses the flames of jealousy and hatred; there is an architect who in the restoration of the old church-tower finds his life's task; and there is the woman, bound to the one by brotherly love yet separated from him by a curious rivalry, closely knit to the other by her first strong love, and to the third by gratitude. Though the ways of these lives are tragic, the final note is one of serene acceptance, for experience has made each richer and broader.

A noteworthy contribution to musical fiction is Friedrich Huch's "Enzio" (Imported by G. E. Stechert & Co.). Readers of the author's earlier story, "Pitt und Fox," will find in this work the same touches of romance, whimsical humor, and imagination that remotely suggest Jean Paul. But they will also find that the author knits the threads of the plot more firmly into a continuous narrative. The hero represents that type of the musical temperament that drifts along the line of least resistance and fails to fulfil the promise of its youth. There is a wealth of artist types in Hermann Bahr's novel, "O Mensch!" (S. Fischer). Coming from the author of one of the greatest dramatic successes here and abroad, it is sure to attract attention. The story has a setting similar to that of "The Concert," the hero being a singer whose robust personality is indicated by the remark that to prove his ability to sing Hans Sachs, a man should show his mettle in the bowling-alley. His relations with his sister, with the prince who would be a singer and is offended when treated as his rank calls for, with the delicate young mystic and vegetarian, and painter folk like those in his novel, "Die Rahl," are described with an admirable lightness of touch and with genuine human understanding.

A book of unusual distinction is the new novel by Ernst Heilborn: "Die steile Stufe" (Egon Fleischel & Co.). It is the story of an elderly widower, who, though not without brave and manly resistance, drifts into a dream of new love and new life with a young woman client of his. The psychological element is admirably worked out. The woman realizes more clearly than the man that he would have a hard step to make before he could leave behind him the past, and breaks off their relations before it is too late, and the hero looks about him and discovers in his daughter the woman who may henceforth become the companion of his inner life, whom he has craved. There is an indefinable quality in the work of Ernst Heilborn that suggests Theodor Fontane, whose "Irrungen, Wirrungen" has just become available to slender purses by being published in Fischer's Bibliothek zeitgenössischer Romane.

Georg Herrmann's book, "Emil Kubinke" (Egon Fleischel & Co.) is an interesting new departure. The hero is a young barber, whose experiences with the other sex reveal to the reader little comedies and tragedies of Berlin life acted in the kitchens, on the servants' staircases, in the hallways of the apartment houses, and in cheap amusement resorts. A curious compound of romance, adventure, and satire is Fritz Wittels's "Ezekiel der Zugereiste" (Egon Fleischel & Co.). The hero is an Austrian who, after an American apprenticeship in business, goes to Europe to chase the phantoms of his imagination and enter upon the career of a Sherlock Holmes. For the successes of the famous detective have fired his ambition as the romances did Don Quixote; episodes of pseudo-heroism follow. Two months in an asylum fail to cure him of his craze, and he leaves the unsympathetic world in an aeroplane.

Some charming volumes of short stories have appeared within the last few months. Hugo Salus never for a moment lets us forget that his is a lyrical temperament, although he never lapses into a poet's diction. The poeti-

cal quality is suggested rather by the spirit than the form of the work. His "Schwache Helden" (Egon Fleischel & Co.) treats a variety of themes with grace and simplicity, one of the most enjoyable being the story of a worthy pedagogue who has turned out an able translation of "Manfred," and, laboring under the delusion that he is a great poet, undertakes to rewrite the end of the work. Hans von Hoffensthal's new book, "Hildegard Ruh's Haus" (Egon Fleischel & Co.), contains among others a group of Tyrolese sketches, happily blending humor and pathos, and told with refreshing spontaneity and simplicity. In the collection of stories entitled "Allerlei Volk" (Imported by G. E. Stechert & Co.), Bernardine Schulze-Smidt proves, as in her novels, her strong grasp of reality, her power to visualize a psychological situation and her gift of delineation. The first of the three stories is a Florentine village idyll with a genial old priest as guardian angel of a pair of lovers; the second is the story of a young teacher who brings sunshine into the lives of two motherless children; the third is a tale of jealousy in a town on the Bosporus, where vengeance flies swift and the cry "blood for blood" is taken up even by the children and the children's children. Luise Algenstaedt is a newcomer whose stories of Jewish life, "Die grosse Sehnsucht" (Imported by Lemcke & Buechner), sympathetically picture Jewish customs and reflect the sentiments of the race.

The most remarkable book of short stories, however, is that of Gabriele Reuter, "Frauenseelen" (Fischer's Bibliothek zeitgenössischer Romane). It is a book of psychological conflicts bearing evidence of the author's insight into the inner life of her sex and of her grip upon vital problems. A young woman who has divorced her husband and is just about to obey the call of a new love, realizes by her husband's claim upon the child that she is not free. A husband returns from the insane asylum to await the end at home and unbalances the mind of the young daughter who had never seen him. A happily married woman has a husband who is so absorbed in his legal practice that he is utterly ignorant of her loneliness. But beside these unrelieved tragedies there are stories with a delightful vein of humor, and others with a streak of brilliant satire comparable to that of Maupassant. Such a story is "Das Opernglas," giving a daring yet discreet glimpse of the many and divers loves a dashing young officer on a sailing vessel can harbor in his manly breast whenever he has shore-leave.

A. von Ende.

Correspondence

THE CRIMINAL'S PRIVILEGE.

To the Editor of The Nation:

Sir: The letter of Mr. H. E. Kelly in your issue of March 2 cites the universality of the "third degree" as a reason for not abolishing the constitutional safeguard against self-incrimination. As a matter of fact, it would rather seem the other way about. Provide an orderly judicial procedure for the arraignment of persons accused of crime—one that will not, as on the Continent of Europe, be secret, but one in which the accused can have counsel but must testify—and you will have gone a long way toward minimizing the extra-legal activity of police, the zeal of reporters, the inquisitorial efforts of neighbors, and the officiousness of others whose enterprise is now stimulated by the existence of a privilege that has outworn its usefulness and has virtually ceased to be an effective protection.

Benjamin Tuska.

Omaha, Neb., March 15.

THE UNQUIET GRAVE.

To the Editor of The Nation:

Sir: The belief that excessive mourning for the dead destroys their peace, that tears may even burn the shrouds of those departed, is a well-attested folk superstition—see, for instance, Professor Child's notes to "The Unquiet Grave," in volume two of his "Ballads." Yet the particular case which I wish to record possesses a certain unique interest as having come immediately from the Chicago Ghetto, and ultimately from the village traditions of a colony of Jews living in central Russia.

A story written by a Chicago newsboy was submitted to me for revision. Briefly, the plot ran as follows: A Jewish rabbi and schoolmaster, angered at the pranks of a certain young scapegrace, punishes him brutally, and finally, when the boy is completely exhausted, frightens him so that he dies. Immediately the rabbi is overcome with remorse; he attempts to expiate his sin by fasting, and spends a year in misery. On the anniversary of his pupil's death he is praying in the cemetery, when the ghost of the dead boy approaches and speaks as follows: "Why have you been wetting my shrouds with your tears these many months, and thus prevented me from peaceful rest?"

The author of the tale assured me that he had never seen anything like this in print, and was surprised to learn that it was more than a local village superstition. "When my mother died, before I came to America," he explained, "I was six years old. My friends stopped my crying by saying, 'Your tears burn the mother,'—and we all believed it, too," he concluded.

Franklyn Bliss Snyder.

Evanston, Ill., March 6.

WORDSWORTH AND GOLDSMITH.

To the Editor of The Nation:

Sir: I do not recall that any one has pointed out the rather curious parallel that follows between a famous passage in Wordsworth's preface to the edition of 1815, and a paragraph in one of Goldsmith's "Essays." In the well-known discussion of the distinction between fancy and imagination, Wordsworth proceeds to illustrate his meaning by instances, drawn, as it happens, from various uses of the word *hang:*

A parrot *hangs* from the wires of his cage by his beak or by his claws; or a monkey from the bough of a tree by his paws or his tail. Each creature does so literally and actually. In the first Eclogue of Virgil, the shepherd, thinking of the time when he is to take leave of his farm, thus addresses his goats:

> Non ego vos posthac viridi projectus in antro
> Dumosa *pendere* procul de rupe videbo.

> —half way down
> *Hangs* one who gathers samphire,

is the well-known expression of Shakespeare, delineating an ordinary image upon the cliffs of Dover. In these two instances is a slight exertion of the faculty which I denominate imagination, in the use of one word: neither the goats nor the samphire-gatherer do literally hang, as does the parrot or the monkey; but, presenting to the senses something of such an appearance, the mind in its activity, for its own gratification, contemplates them as hanging.

> As when far off at sea a fleet descried
> *Hangs* in the clouds, by equinoctial winds
> Close sailing from Bengala, or the isles
> Of Ternate or Tidore, whence merchants bring
> Their spicy drugs; they on the trading flood
> Through the wide Ethiopian to the Cape
> Ply, steaming nightly toward the Pole: so seemed
> Far off the flying Fiend.

Here is the full strength of the imagination involved in the word *hangs*, and exerted upon the whole image, etc.

In Goldsmith's essay on "Poetry distinguished from other Writing" (No. 15) occurs a paragraph which I shall quote in full:

There are certain words in every language particularly adapted to the poetical expression; some from the image or idea they convey to the imagination, and some from the effect they have upon the ear. The first are truly *figurative;* the others may be called *emphatical.* Rollin observes that Virgil has, upon many occasions, poetized (if we may be allowed the expression) a whole sentence by means of the same word, which is *pendere.*

> Ite meæ, felix quondam pecus, ite capellæ;
> Non ego vos posthac, viridi projectus in antro,
> Dumosa *pendere* procul de rupe videbo.
>
> At ease reclined beneath the verdant shade,
> No more shall I behold my happy flock
> Aloft *hang* browsing on the tufted rock.

Here the word *pendere* wonderfully improves the landscape, and renders the whole passage beautifully picturesque. The same figurative verb we meet with in many different parts of the Æneid.

> Hi summo fluctu *pendent,* his unda *dehiscens*
> Terram inter fluctus aperit.
>
> These on the mountain billow *hung;* to those
> The *yawning waves* the yellow sand disclose.

In this instance the words *pendent* and *dehiscens, hung* and *yawning,* are equally poetical. Addison seems to have had this passage in his eye when he wrote his Hymn, which is inserted in the Spectator:

> —For though in dreadful worlds we *hung*
> High on the broken wave,

And in another piece of a like nature in the same collection:

> Thy providence my life sustain'd,
> And all my wants redress'd,
> When in the silent womb I lay,
> And *hung* upon the breast.

Shakespeare, in his admired description of Dover cliff, uses the same expression:

> —half way down
> *Hangs* one that gathers samphire—dreadful trade!

Nothing can be more beautiful than the

following picture, in which Milton has introduced the same expressive tint:

—he, on his side,
Leaning, half raised, with looks of cordial love
Hung over her enamour'd.

We shall give one example more from Virgil, to show in what a variety of scenes it may appear with propriety and effect. In describing the progress of Dido's passion for Æneas the poet says:

Iliacos iterum demens audire labores
Exposcit, *pendetque* iterum narrantis ab ore.

The woes of Troy once more she begg'd to hear;
Once more the mournful tale employ'd his tongue,
While in fond rapture on his lips she *hung*.

The reader will perceive, in all these instances, that no other word could be substituted with equal energy; indeed, no other word could be used, without degrading the sense and defacing the image.

It will be observed at once that not only is the same word *hang* chosen in both instances, but also that two of the passages cited (the first from Virgil, and the Dover cliff lines from "Lear") are identical.* Moreover, in each case Milton is drawn upon—although Wordsworth uses instead of the quotation in Goldsmith a simile which his letter of August 28, 1811 (to Sir George Beaumont) shows to have been long in his mind. It is difficult to avoid the conclusion that Wordsworth (perhaps more or less unconsciously, as apparently was true in the case of certain of Tennyson's borrowings) recalled the suggestive application of *hang* in the earlier essay.

Some further color is given to this supposition by the fact that Wordsworth seems in a few other instances to show interesting traces of Goldsmith's influence. The discussion in Goldsmith's essay on "Taste" (No. 12) of "the energetic language of simple nature, which is now grown into disrepute"—"the plain language of ancient faith and sincerity," as he calls it elsewhere in the same essay—rather curiously anticipates one phase of Wordsworth's own treatment, in the Preface to "Lyrical Ballads," of "the plainer and more emphatic language," "the simple and unelaborated expressions" of humble and rustic life. The whole tone, indeed (and sometimes even the phraseology), of the last half-dozen paragraphs of the essay on "Taste" finds more or less striking echoes in Wordsworth's earlier Preface, as a careful reading of each, I believe, will show. And it would be a task of some interest and value to determine how far the coincidences have real significance.

JOHN L. LOWES.

St. Louis, Mo., March 12.

*The description of Queen Mab which Wordsworth cites as an exercise of the fancy, Goldsmith also quotes, in the next essay but one (on "Hyperbole"), as a description of "fantastic beings," in which propriety is not wholly observed.

GREEK IN THE SCHOOLS.

TO THE EDITOR OF THE NATION:

SIR: Professor Hamilton's article, "Greek in the New York Schools" in the *Nation* of March 9 is most timely. Those of us who have taught English in secondary schools have usually had frequent occasion to wonder at the ignorance of scriptural characters and of classical mythology shown even by children of intelligent families. A class of twenty or more in one of the leading fitting schools in New England recently in reading Schiller's "Jungfrau von Orleans" came across the lines.

Der einst den frommen Knaben Isai's
Den Hirten sich zum Streiter ausersehen.

The teacher asked who was the Shepherd King of Israel. Only two of the class could answer. To the question, "Who was David's father?" which followed, the answer "Isaiah" was promptly given, manifestly inspired by the word Isai. This was a senior class.

It is probably futile any longer to urge that most of the enormous number of students who are fitting for college in our high schools and special preparatory schools should be prepared on a basis consisting largely of Greek. But granting this, it is possible to change their darkness of mind, so far as classical names and allusions are concerned, into a sort of penumbra, at the worst. This can be done without any study of the Greek or the Latin language by getting them to read some classics in translation, and by the use in the schools of a really good manual of mythology. Some twenty years ago the University of California recognized the inability of the average high school pupil to understand classical allusions as so serious a handicap in the study of English poetry after entering the university that Professor Gayley prepared a manual of the classic myths in English literature. This was written with direct reference to use in the high schools of California.

The writer does not know how fully this manual has succeeded in remedying the condition of ignorance which it was intended to alleviate. But he has seen a child of eight years reading Plutarch's Lives in translation with enthusiastic interest, and discussing the acts and characters of the Olympian deities with much intelligence—all without the knowledge of a word of Greek, and with a vocabulary of but a very few Latin words.

J. Y. BERGEN.

Cambridge, Mass., March 15.

HAMLET'S SLANG.

TO THE EDITOR OF THE NATION:

SIR: It seems strange at first sight that in Shakespeare's most intellectual play, the most intellectual of all his characters, "the metaphysician and psychologist" (Lowell) should indulge more freely in "quips and cranks and wanton wiles" than any other of the serious characters of his plays. But on second thought this trait of "the melancholy Dane" is found to be in accord with human nature and with a grave and contemplative mind. "The essence of all jokes, of all comedy," says Emerson in his lecture on "The Comic," "seems to be an honest or well-intended halfness, a non-performance of what is pretended to be performed, at the same time that one is giving loud pledges of performance"; and although there is no intimation that Emerson had Hamlet in mind when he wrote these words, they seem precisely applicable to Hamlet's case. The spring of laughter, it has been said, lies hard by the fountain of tears. The story of Carlini has become familiar by Emerson's use of it in this same essay. While the famous comedian was convulsing Naples with laughter, he himself was the victim of excessive melancholia. A physician who was called in advised him to go to the theatre and see Carlini. "Alas!" came the reply of despair, "I am Carlini." And the public has recently learned since the death of our most famous humorist what his intimate friends already knew, that Mark Twain was a sad and melancholy man. "Oh, how fortunate," he exclaimed on hearing of the death of his friend, Mr. Gilder, "no such good luck ever comes to me."

Hamlet's levity is a reaction from the contemplative mood of the soliloquies, just as Tennyson's coarseness of language at times, as he explained to Longfellow, was a recoil from the refinement of his highly-wrought work of the day.

The first words that Hamlet utters in the play make a pun: "More than kin and less than kind" ("kind" being pronounced with a short *i*), and this is the keynote to his behavior to all except Horatio, when Horatio is alone.

Hamlet drops easily into slang—college slang, one might say—even in his letter to Ophelia: "Thine ever more, most dear lady, whilst this *machine* is to him."

Guild. Oh, there has been much throwing about of brains.
Ham. Do the boys *carry it away?*

Pol. The actors are come hither, my lord.
Ham. *Buz, buz!*

For such news, the modern collegian would, perhaps, say "chestnuts," unless there is something later.

Ros. My lord, you once did love me.
Ham. So I do still, by these *pickers and stealers.*

The modern college slang for *hands* is "lunchhooks."

These are only a few of the illustrations that any one may find for himself in the play.

To understand the appreciation of "Hamlet" by the people, we must take into account the fact that much of standard English in our day was slang to the frequenters of the Globe. Many of our most useful words, as "mob," "cab," "boss," etc., came in as slang, and in the next decade "graft," "stunt," "dope," and hundreds more will lose their quotation marks.

EDWARD A. ALLEN.

Columbia, Mo., March 10.

LETTERS OF JAMES WILSON.

TO THE EDITOR OF THE NATION:

SIR: Would it be within the province of your open letters to make general inquiry as to the whereabouts of stray letters of James Wilson, the constitutionalist, and "signer"? In the preparation of my seven-volumed "Life, Letters, and Works of Wilson," the volume devoted to "Letters" from, to, or about Wilson is approximately complete after a search among collections known to me; but there are many persons who have taken little "flyers" in autograph collecting, and generally aimed at a few "signers," whose eye such an appeal as this might reach. Those interested in this work would greatly appreciate both the possibility of such an inquiry and any responses that might be made to it.

Literature

A DIPLOMATIST'S WIFE.

A Diplomatist's Wife in Many Lands. By Mrs. Hugh Fraser. 2 volumes. New York: Dodd, Mead & Co. $6 net.

This is a very odd and entertaining autobiography, somewhat over-long, but always vivacious. The daughter of Thomas Crawford, the sculptor, the sister of Marion Crawford, a kin on the mother's side to the Wards of New York and the Howes of Boston, allied by marriage with gentlefolk of England and Germany, Mrs. Hugh Fraser has had a most distinguished acquaintance. As a diplomatist's wife, she has travelled widely and lived in many lands. She gathers up not merely her personal reminiscences, but an enormous amount of material touched only by report. The record is not so much of her life as of her interests. A certain superciliousness in her literary manner hardly detracts from the charm of her narrative, nor does the sense that where so much is well invented all cannot be literally true.

Mary Crawford came up in the Rome of Hawthorne's "Marble Faun," a place of gentle decadence, mystery, and exotic enthusiasms. To Thomas Crawford's villa and studio came familiarly Longfellow, Lowell, Bayard Taylor—all accredited Americans. Crawford's flexible vitality, which, untowardly, seldom got into his art, is illustrated by many anecdotes. On one occasion, at a public dinner of scholars and literary men, there was a call for a speech in Greek:

> My father knew nothing of Greek, but had, at some time or other, taken pleasure in hearing it read for the sake of its noble sound. Instantly he sprang to his feet and spoke for some twenty minutes with such fluency, fire, and fidelity to sound and pronunciation that no one dreamed the words were made up as he went along. Those present who had some knowledge of the tongue imagined that he was giving them either a very modern or else a remotely archaic dialect; the sentences had been poured forth so rapidly that they thought it was their own fault if they had not understood them.

But the hero of this book is the brother, Marion, wilful and incorrigibly fascinating. As a child he was backward, till the sister feared him an imbecile. In his 'teens he was an accomplished linguist. In a brief but gorgeous career at the University of Cambridge he achieved a kind of fame:

> He hunted round for the biggest trotting horse he could find, had a towering dog-cart built, dressed himself in checks a foot square and of outrageous colours, and, thus equipped, paraded the dignified university town to the scandal of the authorities and the delight of the students.

The spell of Papal Rome was strong upon the young girl, and through the revolutionary mutterings of the sixties and the ill-fated Garibaldian expedition she already, though her conversion to the Catholic faith was some years ahead, had the sense of violation. Oddly enough, her father's attitude changed from sympathy with the Republican movement to a passive benevolence for the papacy. The mother stood loyally to her republican colors. On all these matters Mrs. Fraser writes with unconcealed bias. An impartial person might find a parable and perhaps an apology for the new order in the following grim anecdote. The Crawford children were sent up with a governess to Rocca di Papa, in the Alban Mountains, for the summer. In the town smallpox raged. Then an aged cardinal, who lived in the apartment below the Crawfords, died:

> Well, the poor, aged, good Cardinal died, and for some reason, which I have never heard explained, it was found impossible to dispose of his body. On the first floor landing was a pretty chapel with wrought iron doors, through which we could see the altar and the tall candles and a curtained picture. After the Cardinal's death, we saw something else—a big, black coffin just inside the bars. There it lay for five solid weeks of an Italian summer. No sanitary precautions had been taken, and the coffin was an ordinary wooden casket.

While on this macabre theme we may note that Mrs. Fraser denies travellers' tales that the South Italians turn over their dying heartlessly to the doctor and the priest. For their dead, however, they take only perfunctory pains. Desiring once to visit the grave of the father of Neapolitan friends, she received the answer: "Why, if you wish we'll go to S. Lorenzo and find where it is."

Celebrities of all sorts people the chapters thickly. We have space only for Mrs. Browning and Cardinal Antonelli, best hated of Papal Secretaries. Young Miss Crawford sat quietly through an audience during which her mother and Mrs. Browning spoke rapturously of the new day dawning for Italy:

> The poetess was everything I did not like. She had great cavernous eyes glowering out under two big bushes of black ringlets, a fashion I had not beheld before. She never laughed or even smiled once, during the conversation, and through all the gloom of the shuttered room I could see that her face was hollow and ghastly pale. *Mamma mia!* but I was glad when I got out into the sunshine again!

Antonelli, who once asked Mrs. Crawford and her two daughters in to see his collections, deeply impressed the visitors. "His face was meant to be mobile, but usually wore a fixed smile which had become a part of his armor." After the larger objects had been seen and remarkable sweetmeats dispatched, the host said, "Ladies like gems, I believe. Now I will show you my greatest treasure."

> Leaving the room for a moment he returned, carrying a small, black leather box some six inches square, with a handle on the top. This he opened with a tiny key, and the room seemed suddenly full of light, for the sun caught and focussed on ten rings, each set with a glorious jewel. Diamonds, sapphires, rubies, emeralds—the little box contained the Cardinal's fortune in portable form, and each gem was mounted after a design of his own, so rich and artistic that the settings really attracted me more than the jewels themselves. We raised the top tray, and ten more rings showed themselves, among these some perfect intaglios; and below again was a third tray with another ten—thirty rings in all, the collection of a life-time. "Why does your eminence keep them in that tiny box?" I asked curiously, when he had closed it again. He lifted it by the strap and looked at me with a twinkle in his eyes. "One might have to take an unexpected journey," he replied. "Such things do happen sometimes, you know." Then I remembered 1848 and Gaeta.

It was always the luck of our author to be on interesting trails. Her uncle, Dr. Howe, linked her to Byron; a visit to Bordentown, New Jersey, opened up to her the Napoleonic romance. Our casual extracts will give some idea of the temper of a book which, with a strong dose of prejudice, is always entertaining and at times reliable. An obvious element of picturesque exaggeration does little harm, for one reads less for facts than for atmosphere. For capital ghost stories it may be especially recommended.

CURRENT FICTION.

The Green Curve. By Ole Luk-Oie. New York: Doubleday, Page & Co.

The fantastic name under which the author of these tales chooses to write apparently conceals the identity of a British army man—unless the Empire contains a second amateur of Kipling's technical expertness. Without Kipling these stories could hardly have been; but they are not imitative in substance or offensively so in style. They deal with various crucial moments in the military life, whether of the officer or of the common soldier. The "green curve," for instance, is the line plotted on a chart showing possible ways of expending the remaining food supplies in a long-beleaguered town. A certain time must elapse before relief will arrive, and the only safe procedure, from the military point of view, is to follow the line indicated by the green curve—to devote all supplies to the garrison, leaving the townspeople to starve or to face the perils beyond the gates. The military governor, whose nickname is "The Butcher," recognizes his duty, and is about to carry it out, when a sudden revulsion of human feeling makes it impossible. The abandonment of the green curve and its stern policy has lamentable results from the military point of view, including the death of the gov-

ernor and the surrender of the city. The fault really belongs to the civilian minister of war at home, who has failed to prepare for the emergency by stocking the town properly before the siege.

Two of the tales, written only four or five years ago, have already been rendered quaint by the progress made with the heavier-than-air flying machine—"The Kite" and "The Joint in the Harness." Of these stories as a collection the author has been right in thinking that, written for soldiers, they are of a sort to appeal to a wider circle. No doubt the fact that they were originally aimed at a special audience goes far toward accounting for their vigor.

My Lady of Aros. By John Brandane. New York: Duffield & Co.

Scotch and Gaelic and the topography of the Island of Mull are the more obvious ingredients. With the help of a map and two glossaries, it is possible laboriously to disengage a romance of Jacobite sedition, but it is "search all day e'er you find it and when you have it, it is not worth the search." The difficulty of following the clew is further complicated by such bungled English phrases as this: "Fraser felt again the joy of his injury's stinging as his knuckles cracked at their task," and the elaborate reticence of conversational passages like this: "'Tis a matter of a little fondness for a cockade devoid of color." This much, at least, is plain: The hero is a shipwrecked surgeon, with a disabled arm, the heroine a fair Stuart sympathizer, sweetly named Morag. The simultaneous presence of her brother Cattanach, a Hanoverian spy, her lovesick kinsman Pennyfuaran, and a Jacobite agitator Drumfin, leads to much surreptitious activity in the open under appropriate weather conditions. The impression that the hero had slain the heroine's perfidious brother is artificially fostered for a time; it occasions no serious offence to any one, but the precaution of dispelling it is not omitted.

Colonel Todhunter of Missouri. By Ripley D. Saunders. Indianapolis: The Bobbs-Merrill Co.

The colonel is "the distinct embodiment of that picturesque native American type, the Kentuckian born and Missourian bred, ... a lineal descendant of that colonial Virginian stock whose grandsons followed the pioneer trail that led from the Old Dominion, first to North Carolina, then to Kentucky and Tennessee and thence to Missouri." In this history of a short period of his career he is met first as an ardent campaigner, seeking to obtain the Democratic nomination to the Governorship for his old comrade, the Honorable William J. Strickland; next as a matchmaker of "incorrigible sentimentalism"; and further as an amateur detective clearing from a murder charge the lover of his daughter. In all three offices, and incidentally as husband, father, and good neighbor, he is the epitome of all that his pedigree suggests. In fact, he seems at the outset all type, a concentrated instance of what local tradition and geography can do for fiction. His individuality, however, extricates itself as the story advances and in the end there is comparatively little danger of confounding him with all the other colonels of Southern fiction. In dialect, for example, he fairly outdoes his kind with his "Great Scott and Maria," his "jim-swizzling," his "jig-whiffling," his "rip-snorting," and his "Satan-straddled" newspaper that "done its durndest" to ruin him. The language of type, to be sure, extends at moments to the colonel's biographer, as when he speaks of the "relishful twinkle" in Todhunter's eye, and of his gift of "colorful oratory, larded with rich humor." Making himself useful in his own town, Nineveh, or stumping the State "for Bill," of a large general benevolence and of a timely pugnacity on occasions, the colonel is a stanch old fellow, the most exhilarating friend and spell-binding orator that ever spoke the jargon of Mizzoorah.

Silverwool. By Emily Jenkinson. New York: Baker & Taylor Co.

It would be interesting to know what literary diet has nourished the author of this bucolic romance which takes its name from a ram of superlative excellence. The story of tragic competition between two flock-masters for the sheep-breeder's prize at the "Great Northern Show" may well have been derived from the oral tradition of some countryside in Northern England. The author leaves us plenty of latitude by her single chronological comment—"those good old days before our modern Education Acts were so much as dreamed of." The English country lover and his English country lass are in an ordinary vein of idealized rusticity similar to that which inspires many American "romances of colonial days." The crippled curate wasting away with consumption, self-abnegation, and soul-searchings is such a one as we should not expect to meet outside the pages of MacDonald. His name is Ishmael Grey, and he preaches repentance in the village square, administers the sacrament to baptized beggars, refuses Christian burial to the unchristened, faints on altar steps, and elicits voluntary confessions.

The writer's imagination runs riot in sentimental and dramatic scenes, and pictures vice in the colors of perfect innocence. The familiar ditty beginning "Hey diddle, diddle" is her idea of a drunken song; and when a man strikes his wife, "'Woman!' he hissed . . . 'John!' she exclaimed." She describes scenic effects with lyric abandon, and a limited vocabulary—a "star, *spinning* on a hilltop, dropped out of sight," "moonshine . . . *splashed like a white wine* on the lake"; then catches herself up smartly with pious reflections, "But our souls . . . are not born to slide through sensuous emotions." Considerable intensity of perception has evidently been perverted by a training in obsolete and mediocre literary fashions.

CHURCH HISTORY.

The Catholic Encyclopedia. Edited by Charles G. Herbermann, and others, in fifteen volumes. Volume 7, Gregory-Infallibility; Volume 8, Infamy-Lapparent; Volume 9, Laprade-Mass. New York: Robert Appleton & Co.

In these three sumptuous volumes, the character of this notable encyclopædia is consistently maintained. The quality of the articles is, on the whole, excellent, the press work is of the best, and the illustrations are many and beautiful. The long articles on Ireland (filling thirty pages), Italy (forty-five pages), and Japan (twenty-five pages) are admirable in every way. In these and other descriptive articles, such as those on Heraldry and Hierarchy, the work is at its best. When doctrinal or polemic matters are discussed, it is naturally less satisfactory to an outsider. For instance, in dealing with the Hierarchy of the Early Church, there is an elaborate attempt to prove the primitive character of the Catholic organization and to gain Biblical and patristic support for it. To many a modern historian, the evident interest underlying such an attempt, whether it appears in a Catholic or a Protestant work, seems foreign enough.

The biographical articles are, in the main, good, as, for example, the beautifully illustrated one on Ignatius Loyola; but it was perhaps too much to expect that such a man as Luther would be treated with understanding. The author even of the article on the notorious heresiarch has evidently tried to be fair, and has omitted the worst calumnies of Luther's enemies, while his strictures upon many of the older Protestant biographies are quite justified. But the desire to be fair is not enough in writing of such a man as Luther. When his manifest faults blind the biographer to the fundamental sincerity of the great reformer and to the superlative qualities of his genius, the result can at best be little else than caricature. Most of the papal biographies—of the Gregorys, the Innocents, and the Leos—are fair and discriminating, and even Pope Honorius is treated with exemplary impartiality, considering the difficulties he has made for the upholders of papal infallibility.

The long article on Ecclesiastical His-

tory is useful, especially for its full bibliography. The following frank statement of the attitude of the orthodox Catholic historian, which is apparently shared by the author himself, only adds to the value of the article:

> The Catholic Historian does not admit that the various forms of the Christian religion may be taken, roughly speaking, as a connected whole, nor does he consider them one and all as so many imperfect attempts to adapt the teachings and institutions of Christ to the changing needs of the times, nor as progressive steps toward the future higher unity wherein alone we must seek the perfect ideal of Christianity. There is but one divine revelation given us by Christ, but one ecclesiastical tradition based on it; hence one only church can be the true one, *i. e.*, the Church in which the aforesaid revelation is found in its entirety, and whose institutions have developed on the basis of this revelation and under the guidance of the Holy Spirit. To assume equality among the various forms of the Christian religions would be equivalent to a denial of the divine origin and supernatural character of the Church. (Vol. VII, p. 367.)

There is also a capital article on Heresy, which describes without shrinking the persecuting activities of the church. The usefulness of the article for intelligent readers is not impaired by such personal judgments as the following: "Toleration came in only when faith went out"; "The rôle of heresy in history is that of evil generally. Its roots are in corrupted human nature"; or by the author's notion that Modernism has served the useful purpose of other heresies in calling forth "a solemn assertion of the claims of the supernatural in history."

The elaborate article on the Inquisition is sane and judicious, and much sounder in its general estimate than the great work of Lea, to which the author takes serious exception. It is justly said at the beginning:

> Moderns experience difficulty in understanding this institution, because they have, to no small extent, lost sight of two facts. On the one hand, they have ceased to grasp religious belief as something objective, as the gift of God, and therefore outside the realm of free private judgment; on the other, they no longer see in the Church a society perfect and sovereign, based substantially on a pure and authentic revelation, whose first and most important duty must naturally be to retain unsullied this original deposit of faith. Before the religious revolution of the sixteenth century these views were still common to all Christians; that orthodoxy should be maintained at any cost seemed self-evident.

The articles on the Immaculate Conception and Inspiration contain beautiful examples of genuine theological scholasticism, but the portion of the latter dealing with the development of the doctrine of inspiration in Protestantism is exceedingly well done, even though it does close with the supposedly condemnatory sentence, "Freedom of examination was destined sooner or later to produce freedom of thought." The German *Kulturkampf* is recounted with notable self-restraint; indulgences are described satisfactorily and with full recognition of the evils to which they once gave rise; while the article on Infallibility, though a thoroughgoing defence, written by a devout believer in the Vatican decrees, is in its tone above reproach. On the whole, even an outsider must commend not only the painstaking care given to these volumes, but also their general freedom from polemic zeal.

Essays in American History. Dedicated to Frederick Jackson Turner. New York: Henry Holt & Co. $1.50 net.

Ten disciples of Professor Turner unite in this volume to signalize his presidency of the American Historical Association by a tribute of respect. The form taken is not a direct expression; of that there is nothing beyond the few lines of preface by the editor, Guy Stanton Ford. Essays are presented written under the influence of their leader's spirit, sometimes, perhaps, exercises of the seminar. The book is a delicate and appropriate testimonial, and Professor Turner may justly take pride in having so far won the hearts of his students, and in the excellent workmanship of which he has made them capable. The essays relate to passages of American history which are obscure, either because of their relative unimportance, or because their importance is just becoming apparent. The range is wide, Oregon and Virginia affording topics, as well as the South and Central West, while two of the most valuable monographs have to do with South America. The papers are clear and foot-notes bottom every page with chapter and verse for all statements. The word we especially associate with Professor Turner is the Frontier. The particular conditions arising when a wave of civilization strikes upon a wilderness we suppose have never been better estimated than by him, nor the results inuring therefrom to the life of our nation. The essayists have not failed to receive impression here, for in their conception of American development the Frontier is constantly at the fore.

We have some fault to find. Three auditors of the admired Dr. X. talked together in the vestibule after the sermon. "We must admit," said the first, "that the Doctor dives deeper into his subject than any other." "Yes," said the second, "and stays under longer." "And comes up dryer," added the third. We admit that our essayists dive deep and stay under long, and find all that needs to be found; and they keep very dry. Presumably the writers are young; but there is no sign of the natural exuberance of youth. With the exception of Prof. C. L. Becker's "Kansas," the papers have small literary quality. There is no gleam of humor; and if we grant that to be a trait not called for in historic writing, as much cannot be said for other traits which are equally absent. There is no attempt to portray the form and character of significant personalities; nor can a page be found enlivened by a graphic picture of some past event. The lack of portrayals of men we feel especially in the essays relating to South America, a continent of which we have known, and cared to know, little, but which now is thrust into the close foreground. Even Bolivar, the hero who is nearest to our sympathies, is a shadowy figure, and his contemporaries and successors are very faint in our conceptions. Professors Robertson and Reinsch have studied their topics well. They know the Spanish and Portuguese authorities admirably, judge movements well, and are sane in their philosophy. We want, however, to know more of the men they talk about, whom evidently they admire. Miranda, Alberdi, Orea, Revenga, San Martin, men of action, diplomatists, and writers, ought not to go entirely undescribed; yet in these narratives they are scarcely more than names.

We have referred to Professor Becker's "Kansas" as especially marked in this series by its literary quality. He tells good and apt stories; he turns his sentences often with a pleasant wit. To the question from time to time so widely pressed, "What's the matter with Kansas?" he gives an answer full of penetration enlivened and fortified by much concrete example. He might have used with advantage now and then an extended picture. For instance, to this generation for the most part the grasshopper is not known as a burden, and to help the world to a sense of how ponderous he has been in Kansas is worth a few graphic sentences. We recall a journey through Missouri, along the Kansas border into Nebraska and Iowa during a grasshopper year. Though it was mid-June, not a green thing could be seen upon the surface of the plain, only an expanse of black mud here and there appearing, under this muffling swarm of life. Whatever had germinated had been consumed, and for the farmer the possibilities of the year seemed quite vanished. By the end of the month, however, the plague had gone. The indomitable farmers planted anew, and favored by sun and rain and the holding off of frost achieved in spite of all a teeming harvest. Such a thing Professor Becker has seen and has the faculty for making vivid in presentment.

A taste affects modern historic writers quite different from that which prevailed with Irving and Bancroft, and even with the Boston trio, Prescott,

Motley, and Parkman. It is thought that in those days History walked in robes too flowing, with an over-display of the purple patch. Our grandsons may feel that in our time, on the other hand, her garment has been quite too sad-colored and scant. Diligence, accuracy, sound judgment are primary requisites, but grace and picturesqueness are not to be entirely thrown aside, unless we are content, like the plodding author some one describes, to write our books with no thought of anything so irrelevant as a reader.

The Conflict of Colour: The Threatened Upheaval Throughout the World. By B. L. Putnam Weale. New York: The Macmillan Co. $2 net.

The main thesis of Mr. Weale's diffuse, but very stimulating, book is that Europe, or, more accurately, the white race, must make up its mind to abandon in the near future the policy of political domination and territorial aggrandizement which it has thus far followed in dealing with Asia and Africa; and must devote itself to building up on those continents a balance of power which will offset, and, in consequence, help to maintain, the balance of power in Europe. The necessity of such a change he finds not so much in the physical inability of the European Powers to retain their hold upon the lands which they have appropriated, although that hold is obviously weakening, as in the fundamental and ineradicable antagonism of race: an antagonism not, indeed, now for the first time perceived, but growing portentously in significance and intensity as the yellow, brown, and black peoples gain in intelligence and race consciousness, and realize the invincible advantage which lies in overwhelming superiority of numbers. World-empire, the permanent rule of one people by another, the universal spread of European civilization and the Christian religion, are, when judged by the immutable tendencies of things, only such stuff as dreams are made of; and not only can they never be realized as facts, but they ought, in the interest of European safety, to be got rid of both as ideals and as political programmes.

Readers of Mr. Weale's earlier books on the East will not need to be told that he writes with animation and earnestness; that while his knowledge of European history, prior to the nineteenth century, is not always profound or even up to date, he nevertheless knows the East well; or that his pages, in spite of more than one iconoclastic thrust, are full of thoughtful suggestiveness. The classical curriculum of the English universities, so far as preparation for service in the East is concerned, seems to him little better than a useless lumber of the mind, forming in the minds of young men a conception of the world as it is not. As for Christianity, that, in Mr. Weale's opinion, is hardly to be thought of as a religion any longer, its spiritual and philosophical content having long since been overshadowed by a vast structure of formalism and unenlightened organization. For the great majority of the human family —that is, for the two-thirds of the world population who are not white—Buddhism and Mohammedanism seem to be the conquering faiths; though in the case of the negro, whom he regards as a type of arrested development, Christianity would seem to be for the present the safer religion to inculcate, since it does not, like Mohammedanism, nurture the military instinct.

In his exposition of the obstacles to Japanese hegemony in Asia, of the political power of an awakened China and India, and of the significance of the European struggle for the control of the Persian Gulf, Mr. Weale is in accord with many, perhaps most, informed and thoughtful observers of recent events in those regions; while his sharp arraignment of England for its failure to give to the masses of people in Egypt and India social contentment, economic prosperity, or even elementary education, may well be pondered by those who affect to see in England's colonial policy relative perfection. So much of what he has to say on the political aspects of his problem, however, is of the nature of prophecy that one may not venture to speak with confidence regarding the soundness of his programme. What he has done, and done very interestingly, is to point out once more the profound significance of race in world politics, the provincial prejudice which underlies much of the policy of European states, including England, in dealing with the East, the determining power of numbers when once the numbers act together, and the apparent need of compassing, in our thought for the future, generically different types of government and religion for peoples racially diverse.

Brandywine Days; or, The Shepherd's Hour-Glass. By John Russell Hayes. Philadelphia: The Biddle Press. $1.50 net.

Out of the reading and wanderings and poetic meditations of his vacations in the old home of his ancestors in Chester County, Pennsylvania, Mr. Hayes has made a pleasant, almost charming, volume. It is divided into short chapters of prose and verse, one for each day of the summer; and the tone is set on the first page:

> And here beside my ancestral stream, the Brandywine, or old Indian Wawassan, as I rid me of the dust of clamorous streets, on this sweet midday of June, and take up once again my shepherd's crook and rural quill, I thank the dear God that He still keeps green for town-wearied folk such lovely nooks as this.

The note here is a little more sentimental than the book as a whole, but Mr. Hayes is one who believes in flowers, and murmuring streams, and stars, and children, and green fields, and in poets who write of such things, and he is not afraid to display his feelings. Some of the chapters are a bit naïve, but others have the true flavor of pastoral prose. From the real Arcadia of his home, the author easily wanders to memorable scenes of the past and to idyllic places of the present far removed from the meandering Brandywine. So in one chapter he introduces a visitor, "Silvia," from a neighboring "old-fashioned and most comfortable farmstead," who recounts her travels in the Vale of Tempe and other romantic places of Hellas. And in another chapter, after some pleasant chat about Herrick's "Hesperides," he quotes his brother's impressions of Dean Prior as it stands to-day:

> I looked in upon the ancient kitchen and dining-room, the very same in which good old Robert Herrick feasted on his garden's products and sat before his cosy fire and thanked God over and over for the joy of rural contentment and true and simple pleasures.

In this way travel and literature enter into the author's days on the Brandywine, which, otherwise, might too soon become cloying in their stillness. Nor is criticism, of the romantic, not to say sentimental, kind absent. Pater, whom Mr. Hayes heard lecture in Oxford on Raphael, is one of his idols, and two or three of the sections are devoted to telling, and telling well, how Pater, "in his lucid and tranquil prose-discourse," has the power to reawaken in us the perception of the vital beauty of daily life. Even more interesting are Mr. Hayes's comments on various living poets of America. His quotations from these uncrowned bards might almost persuade one to fall in love with minor poetry. His own verse is on the whole better, we think, than his prose. As an illustration we cite a stanza or two from the poem entitled "Enchantment" under September 1:

> Old forms forgotten of the world of men
> Still haunt the common ways of life for me;
> Lone vales and dreaming rivers to my ken
> Are fraught with glamour and with mystery.
> I hear strange harmonies among the hills,
> I drink the fragrance of forgotten things;
> In whispering forests still the dryad sings,
> And strange emotion all my being thrills. . . .
>
> As some lone child that wanders far from home
> Sees all its sweetness through his tender tears,
> So phantoms fair of Hellas and old Rome
> Arise for me from out the ancient years.
> The paths of life to others sad may seem,—
> They cannot but be glorified for me

Who find them fraught with myth and mystery
And all enchantments of the world of dream.

The Old North Trail. By Walter McClintock. Illustrated. The Macmillan Co. $4 net.

The Old North Trail, worn many generations ago by the tread of numberless Indian feet, follows the Rocky Mountains from north to south, its upper extremity emerging from the barren lands of the Dominion, and its lower reaching into Mexico. It is now overgrown in some parts, and in others obliterated by white settlements; but for long stretches the Indians of the present day are able to trace it, and love to do so because of its epic traditions. As the most aggressive of the plains tribes, with a brilliant record for prowess in war and the chase, the Blackfeet are more notably associated with the trail than any other Indians, and their present dwelling-places, on both sides of the Canada line, lie near it. This, doubtless, is Mr. McClintock's reason for making the trail furnish a title for his book, to which, though strictly only a narrative of personal experience, he has aimed to give the flavor of authority. Repeated visits through a period of fourteen years, originally as a member of a Government expedition, and later as a lover of the Blackfeet and their country, have afforded him exceptional advantages for the accumulation of data concerning them—which he here uses modestly and with generally good effect; and the total result is a picture of Indian life and thought which, except in certain specific details, is sufficiently broad to give a novice in the study of our aboriginal race a satisfactory point of departure.

For instance, the Indian mode of fixing dates is well illustrated by the Blackfeet "winter counts," such as "the winter when the children broke through the ice"; "the winter when the moose came into camp"; "the winter when we caught antelope in the deep snow," etc. Their picturesque calendar designates November as "after the first snow-fall"; the turning of the year as "the time of the first Chinook" (thawing wind); midwinter, as "when the buffalo calves are black"; spring as "when the geese come"; June as "the time of high water"; July and August as "home days"; October as "when the leaves fall." They have some pretty conceits, too, in their names for the wild birds. The white-throated sparrow is the Nepe-e, or the "summer-bringer"; the catbird bears a name meaning "the baby," because of its cry; and the kingbird is called "stingy-with-his-berries," because he makes such a chattering when disturbed at his feast. The titles they have given various quadrupeds are quite as descriptive. The beaver's means, "cuts-with-his-teeth"; the badger's, "striped-face"; the white-tail deer's, "wags-his-tail"; the mule's, "big-ears." Like many other tribes, the Blackfeet have a superstitious aversion to telling their own names; but there surely is no savor of mystery in "Cries-all-the time," or "Everybody-down-on," or "Born-with-teeth." It is only when we find a young woman called "Whistling-all-night" that it is necessary to explain that she was born in January, and named in commemoration of a habit of the jack-rabbit in that month.

Persons unfamiliar with the Indians are apt to infer, from their ignorance of the uses and value of money, that they are by nature wantonly improvident. The old-fashioned Indian, certainly, is not liable to such a charge, the injustice of which Mr. McClintock indicates by a quotation from the speech of Brings-down-the-sun, one of the unmodernized chiefs, in welcoming a guest to his camp. "You will find many kinds of berries on all sides," said the old man. "You can eat them now, or gather and dry them for your winter supply, just as we do. I ask, however, that you will be careful not to injure the trees, or break the branches of the berry-bushes. I make this request, because I am looking ahead for my tribe. I am anxious to preserve the big trees and the berry-bushes for our children." It would be hard to find better conservation doctrine than this, from one of the original owners of all the natural resources on the American continent.

As might be expected, a large share of the text is devoted to descriptions and interpretations of the religious and social ceremonials of the tribe. For the general reader, the author's treatment of the sun-dance will have most interest, as it is this rite which has excited more discussion than any other between the ethnologists who regard it sympathetically and the non-scientific apostles of Indian civilization. Mr. McClintock, in his capacity of chronicler, holds the balances very evenly between the two views, though it is plain that personally he is under the spell of the poetic symbolism of the dance, which in its own crude way is dramatic and beautiful. His farewell remarks to his red friends, at the last council in which he took part, embodied a promise that he would make the white people of the East better acquainted with the Blackfeet and their religion, and this book is evidently a concrete fulfilment of his pledge.

Of the Indian question in its broader aspects, and of the Government's relation to it, little is said outside of the last half-dozen pages of the narrative proper. An appendix, part glossary and part commentary, several specimens of Indian music, and a small map are calculated to aid the reader's understanding of the story, which, at intervals, betrays Mr. McClintock's literary inexperience by its diffuseness. Of the pictures, 195 in number, at least half could have been omitted without loss, and those in color are so raw in tone as to detract from the serious effect it was the author's obvious intention to give his volume by its dress.

Life of the Black Prince. By the Herald of Sir John Chandos. Edited by Mildred K. Pope and Eleanor C. Lodge. New York: Henry Frowde. $7.75 net.

The Black Prince. By R. P. Dunn-Pattison. New York: E. P. Dutton & Co. $2.50 net.

The earliest biography of the Black Prince, the French poem by the Chandos Herald, has now appeared in a scientifically accurate and complete edition. It contains a detailed study of the language of the poem, an historical introduction, a diplomatic print of the single manuscript, a reconstructed text, an English translation, notes, indices, and a glossary. The examination of the linguistic peculiarities of the poem leads the editors to the conclusion that it was written in the French of Hainault, and that the extant version is twice removed, by Anglo-Norman transcription, from the original. Their argument as to the date of the poem is not conclusive. They hold that it was composed some ten years after the death of the Prince: it is at least equally possible that it was written in large part during his lifetime, with the purpose of winning gifts from him, and later completed and retouched. The continual praise of "largece," the fact that surprisingly little is said of Sir John Chandos, and the peculiar relation of the poem to the two versions of the Chronicles of Froissart, seem alike to point to this conclusion. The historical value of the poem is greatest in the two thousand lines—half of the whole—which deal with the Spanish campaign, of which the Herald was an eye-witness. He gives many details of the battle of Poitiers which do not appear in the other sources, but it seems probable that he obtained this material at second hand. Throughout the poem the Prince is extolled as the ideal chevalier, the most valiant "that ever was since the days of Claris, Julius Cæsar, or Arthur," loyal, devout, and bounteous. The narrative is concise and spirited. The Herald delights in gleaming banners and in knightly prowess, but there is a touch of wisdom in his battle formula: "There might a man regale himself at the sight—one to whom naught was at stake."

The latest successor of the Chandos Herald is R. P. Dunn-Pattison, whose biography affords the general reader an accurate and very interesting account of the Prince's career. He has read and utilized the early narratives and the modern critical works which deal with the Prince, has studied the specific conditions of mediæval warfare, and writes

with authority on tactics and strategy. He is at his best in the accounts of battles and campaigns, but gives them no more than their due share of attention: he treats adequately the formative influences of the Prince's youth, his spectacular hospitality, his extortionate oppression of his English tenants, and the overwhelming difficulties of the administration of Aquitaine. The estimates of the Prince as man and as general are notably just and enlightening. Only less interesting than the figure of the Prince himself is that of Sir John Chandos, at once his adviser and his companion in arms. Mr. Dunn-Pattison does not hesitate to call him "the best diplomatist and the soundest soldier of the day."

English Political Institutions: An Introductory Study. By J. A. R. Marriott. New York: Henry Frowde. $1.10.

The author of this compact and useful book disclaims originality. There is, however, a strong tinge of it in his method; for he begins with current political conditions and constitutional practices, and then works backward to their sources and historic development. This gives a novel and desirable freshness of treatment to his work, while not impairing its soundness. Mr. Marriott had before made ample proof of his scholarship in this field, and in his brief and lucid expositions follows the best authorities. As regards recent and pending constitutional changes, he frankly permits us to see that his sympathies are with the Conservative party, but this fact gives only the slightest color, here and there, to his statement of the case—as when he declares that the "verdict" of the general election of 1909 on the Finance Bill was "unfortunately too ambiguous to permit any positive deduction to be drawn from it." The Lords themselves did not see any ambiguity, and promptly accepted the Budget which they had thrown out.

After two preliminary chapters on the classification of Constitutions and the peculiar and salient features of the British Constitution, Mr. Marriott passes on to discuss in detail the powers of the Crown and of Parliament, and gives a summary view of local government, the judiciary, and the relations of the Empire to the colonies. No part of his work is more suggestive than his account of the way in which the Government of the day is usurping more and more of the time of Parliament, so that no bills except those of the Ministry have much chance of coming to enactment; while behind the Government stands an ever growing tyranny of party management. Such vital political causes may profoundly affect the working of constitutional institutions, even though little notice of them be taken by the text-books.

Notes

Doubleday, Page & Co. promise for this week E. F. Benson's "Account Rendered."

An edition of Edmond Rostand's "Les Musardises," including several unpublished pieces, is about to appear in Paris.

The Appletons announce for publication next month, "The Training of Children in Religion," by Dean Hodges of Cambridge; and for immediate publication: "The Bramble Bush," by Caroline Fuller, and "The Obvious Orient," by Prof. Albert Bushnell Hart.

Gen. Francis Vinton Greene has in the press with the Scribners his new book, "The Revolutionary War and the Military Policy of the United States."

"Mr. Wieherly's Ward," L. Allen Harker's novel, to be issued by the Scribners, is said to continue the story of "Miss Esperance and Mr. Wieherly."

Jennings & Graham of Cincinnati will bring out in April or May: "The Social Engineer," by Edwin L. Earp; "On and Off the Trans-Siberian Railway, or Strange Siberian Sights at Close Range," by Marcus L. Taft; "In His Footsteps," a record of travel to the land of Christ, by William E. McLennan, and "The Ladies' Aid Manual," by R. E. Smith.

The following books in the hands of Houghton Mifflin Co. will be ready Saturday: "The Contessa's Sister," by Gardner Teall; "China's Story," by William Elliot Griffis; "John Bright," by R. Barry O'Brien; "The Heart of the Master," by William Burnet Wright, D.D.; "The Standard of Living Among the Industrial People of America," by Frank H. Streightoff; "The Function of the Church in Modern Society," by William J. Tucker, D.D., and "The Recitation," by George Herbert Betts.

Prof. Joel Elias Spingarn is publishing with Sturgis & Walton "The New Hesperides and Other Poems." The same firm announces "When a Cobbler Ruled the King," a romance of the French Revolution, by Augusta Huiell Seaman, and "White Motley," the story of an airman in the Alps by Max Pemberton.

Arthur Stringer is at work on a volume of "Irish Poems"; the publisher will be Mitchell Kennerley.

Victor Hugo's "Les Travailleurs de la mer," abridged and edited with introduction and notes by Prof. E. F. Langley, is promised immediately by D. C. Heath & Co.

John Lane Company brings out this week, "Mary Wollstonecraft: A Story in Economics and Romance," by G. R. Stirling Taylor, and "The Passionate Elopement," a story of stage coaches and Bath, by Compton Mackenzie.

In Richard G. Badger's announcements are found: "Friedrich Nietzsche and His New Gospel," by Emily S. Hamblen; "The Value and Dignity of Human Life, as Shown in the Striving and Suffering of the Individual," by Prof. Charles Gray Shaw, and "St. Paul's Friendships and His Friends," by Carl Hermon Dudley.

Messrs. Hodgson of London are selling many interesting volumes from the library at Birch Hall, near Colchester, England. We note the following: Gower's "Confessio Amantis," printed in 1483 by Caxton, wanting eighteen leaves; Caxton's translation of the "Vitæ Patrum," printed by De Worde in 1495, and by this same printer, the "Polychronicon," 1495; a Latin Psalter, printed by Reynault in 1519, and once owned by Sir James Boleyn, uncle to Anne Boleyn; a first edition of Voltaire's "La Henriade"; an "Encouragement to Colonies," with a map, by Sir William Alexander, a reissue in 1630.

Some years ago, Mr. Nicholls, the husband of Charlotte Brontë, lent to Clement Shorter a manuscript volume of Emily Brontë's poems, with permission to print whatever Mr. Shorter liked of them. In 1902, sixty-seven of these poems were privately printed in a small edition by Dodd, Mead & Co. To these, Mr. Shorter now adds seventy-one more poems from his manuscript, and publishes them with the rest of Emily's verse in the first of two volumes that are to include her "Complete Works" (Doran Co.). It is hard to know just how to receive such a publication. The temptation to print these relics of an admired author is almost irresistible, yet it is a question whether the memory of the writer is honored or the good public really benefited by yielding. The present reviewer can speak only for himself, and he must say that Emily Brontë seems to him a truer poet and her poetry is more enjoyable to him in the edition which contains only the few better pieces selected by her sister than in this volume in which the immature and the crude or commonplace bulk so large. He has looked in vain among the pieces now first printed for anything that shows the mark of genius. A fair specimen is the following, entitled "Lines" and dated December, 1837:

I die, but when the grave shall press
The heart so long endeared to thee,
When earthly cares no more distress
And earthly joys are naught to me,

Weep not, but think that I have passed
Before thee o'er a sea of gloom,
Have anchored safe, and rest at last
Where tears and mournings cannot come.

'Tis I should weep to leave thee here
On that dark ocean sailing drear,
With storms around and fears before,
And no kind light to point the shore.

But long or short though life may be,
'Tis nothing to eternity;
We part below to meet on high,
Where blissful ages never die.

W. Robertson Nicoll provides an Introductory Essay to the poems, in which the known facts of Emily Brontë's life are given and a high estimate is placed on her work.

Under the somewhat sensational title, "Im Schatten der Titanen" (Stuttgart: Deutsche Verlagsanstalt), Lily Braun has published the memoirs of her grandmother, Jenny von Gustedt, a natural child of Jerome Bonaparte, who, after the breakdown of the Napoleonic rule and Jerome's flight from Cassel, was taken by her mother, a Countess von Pappenheim, to Weimar, and who thus passed her youth amidst the intellectual and artistic refinement of the little Thuringian capital. Her descriptions of Weimar life in the twenties of the nineteenth century are intensely interesting. She was an intimate friend of Goethe's daughter-in-law, and Goethe himself took a fatherly in-

terest in her. His figure naturally stands out preëminently in these memoirs, and we get here many new glimpses of his daily life and domestic circle. Most pathetic is the account of the unhappy relations between the indolent, handsome, and good-natured August von Goethe and the hysterical and erratic Ottilie, ending in his flight to Italy and tragic death. But the book affords many other vivid character-sketches of noted men and women—of Karl August, the ever effervescent and boon companion; of his solemn and ethereal wife; of Felix Mendelssohn, the wonder child; of the vagabond, Karl Holtei; of the Princess Augusta, who was to become the first German Empress, and lastly of Jerome Bonaparte, who, after he had settled down to private life in Paris, resumed fatherly relations with his German daughter, and to his death maintained an affectionate correspondence with her.

Another book by a German woman which throws light on intellectual and social conditions of nineteenth-century Germany is the biography of Frau Pauline Brater, wife of the well-known liberal publicist, Karl Brater, written by her daughter, Agnes Sapper (Munich: Oskar Beck). The father of this truly noble woman, Wilhelm Pfaff, was professor of astronomy at the University of Erlangen and a colleague and neighbor of the poet, Friedrich Rückert, who, in the twenties and thirties, held the chair of Oriental languages at Erlangen. Of the eager intellectuality and the primitive simplicity of life in the Franconian university town, this biography gives many instances. Pfaff, apart from his scientific attainments, was a well-known Sanskritist and assisted Rückert in his poetic gleanings from Hindu literature. Rückert's fine version of the legend of Nal and Damajanti, for instance, was in reality the product of his coöperation with Pfaff. Both men, however, were so poor that they could not afford to have each a copy of the original; and thus the single copy which they had procured in common travelled to and fro between the two professorial houses until the translation was done. From the description of this quiet academic life of the early nineteenth century, the book in its second and larger half turns to the stormy political career of Karl Brater, his advocacy of the principles of 1848, his struggle with the persecution and ignominy visited upon him by the Bavarian authorities, his fight in the Bavarian Diet for the cause of German unity, and his premature death just before the triumph, in 1870, of the ideals to which he had given his life.

A little collection of "Tales from the Old French," translated by Isabel Butler, has recently been issued by Houghton Mifflin Company. Miss Butler's work as a translator is too well known to require further testing or illustration. She has selected six *lais:* "The Lay of the Bird," "The Woful Knight," "The Two Lovers," "Eliduc" (the last three by Marie de France), "Melion," and "The Lay of the Horn" (the last by Robert Biquet); three *fabliaux* (the first by Bernier and the last by Huon Leroi): "The Divided Blanket," "Of the Churl Who Won Paradise," and "The Gray Palfrey"; four *contes dévots et didactiques:* "The Knight of the Little Cask," "The Angel and the Hermit," "The Jousting of Our Lady," and "The Order of Chivalry." A brief epilogue explains very simply the nature of the mediæval *genres* here represented, and the Translator's Note states that her purpose is to present to students in one volume, "something of the range and scope of the Old French short story." Only three of the tales in the volumes had before been completely Englished—"The Two Lovers," "Eliduc," and "The Order of Chivalry," the last by William Morris in the Kelmscott Press edition of Caxton's "Order of Chivalry."

It is an instructive and interesting review of French works treating Scandinavian subjects from Rabelais to Leconte de Lisle, Gunnar Castrén gives in his recent book "Norden i den franska litteraturen" (Helsingfors: Waseniuska bokhandeln). The French travellers and diplomatists of the sixteenth and seventeenth centuries found few things attractive in the North, and their accounts could not excite much interest among their countrymen for these regions, where there were *arbores sine fructu et lapides sine usu,* as one of those visitors summarized his impressions of them. The heroism of Gustavus Adolphus and the eccentricities of his daughter Queen Christina, who called a few French scholars and a considerable number of mere parasites to the Swedish court, aroused great interest in France, but did not further in the same degree the knowledge of Scandinavian matters. The French poems and novels of the seventeenth and the earlier part of the eighteenth century, dealing with Northern themes, are therefore commonplace and devoid of local color. The historical works of Vertot and Voltaire were, of course, of value, but they did not cause any great change in this literature for the better. The dramatists often found Scandinavian subjects useful for their purpose, and it is interesting to note what part the Swedish mines played in their imagination. In the latter half of the eighteenth century, Bernardin de Saint-Pierre was the first Frenchman to give a vivid and true picture of Scandinavian scenery (Finland), and about the same time P. H. Mallet introduced to French readers the mythology of the North and old Icelandic literature, but his influence was soon eclipsed by the enthusiasm for the Ossianic poems, which were frequently looked upon as connected with Scandinavia, a confusion for which Mallet himself is partly responsible. The works of the early romanticism, such as Hugo's "Han d'Islande," are certainly no improvement. Through the translations and writings of Ampère and Xavier Marmier we finally reach Leconte de Lisle, who succeeded where all his predecessors had failed; he alone treats Scandinavian themes in masterly French poetry and at the same time with fidelity to the spirit of the North. With him the author takes his leave, pointing out that the French knowledge of Scandinavia is not even to-day unimpeachable, since Jules Lemaître has had great difficulty in deciding whether Strindberg was Danish, German, or something else.

The "Soliloquies" of St. Augustine is a work not frequently read, but though it has not the finely imaginative qualities of the "Confessions" or the "City of God," it contains interesting philosophical speculation and is biographically important. Written in 386, it gives us an impress of the writer's intellectual condition at the moment when he was passing from Neoplatonism into Christianity. The chief problems which the solitary thinker debates with his other self are the nature of cognition and the immortality of the human soul. A smoothly reading translation of this work has been published by Rose Elizabeth Cleveland (Little, Brown & Co.). It is accompanied by notes and an introduction which, though diffuse and amateurish, will interest the reader in St. Augustine.

The status of a solitary white woman in the Australian bush would appear to be analogous to that of the traditional baby in the American mining camp, her advent provoking as many misgivings and her presence inspiring a like degree of indulgent pride, amusement, and solicitude. At least such is the position assigned to and complacently accepted by Mrs. Æneas Gunn, who, under the ambiguous title, "We of the Never-Never" (Macmillan), recounts the details of her year's sojourn among the bushmen of the northern territory. People and scenes "out-bush" are observed with a friendly eye and described with unflagging vivacity, and every incident even remotely approaching an adventure is relished to the full. Barring a slight tendency to the unctuous and tho prolix, the quality of the narrative is admirable, and leaves the impression of a somewhat rosy picture of real conditions. It must, however, be confessed that the exuberant enthusiasm which distinguishes the amateur participant in pioneer life is apt to prove only mildly contagious, except to such as are content to travel in books and hear the characteristic idioms of new frontiers in quotation marks.

In view of the obscurities attending the later career of Mary Queen of Scots, any addition to our knowledge of her is welcome. The Bardon Papers, edited by Dr. Conyers Read, for the Camden Series of the Royal Historical Society, Vol. XVII, concern this period of her history, from 1572 to 1586. Nearly all the documents are contemporary copies of originals which have been in part printed, though the editor gives us but slight intimation of this fact. The notes of Sir Christopher Hatton and Sergeant Pickering and some of the Burghley letters appear, however, for the first time. Dr. Read thinks that the documents were got together for Hatton as material upon which to base a speech, which was delivered in Parliament in 1586, but he is unable to explain how the papers got into Bardon House in Somersetshire, where they had lain for two centuries, until purchased by the British Museum in 1870. As a whole, the collection adds but little to our knowledge of the circumstances attending Mary's imprisonment, trial, and execution, and Dr. Read's preface, while an excellent summary, contains nothing that can be called strictly new. The value of the papers lies in the fact that they disclose the strength of the case against the Queen of Scots, as presented by the English government at the trial. Dr. Read has performed his editorial functions with care, and it is, therefore, the more surprising that on page 20 he should speak of Maitland of Lethington as Mary's representative at the trial in October (not summer) of 1568. Maitland was one of the commissioners at York, and secretly devoted to Mary's interests, but he was not

her representative, a position held by the Bishop of Ross.

It is only about a twelvemonth since the famous historian of the University of Leipzig, Prof. Karl Lamprecht, caused consternation in the academic world of Germany with his winged words: "The German universities no longer stand at the head of the international university organization; other universities, especially those of America and France, have already outstripped the German." Taking these words as a text, Prof. Alfons Dopsch of the University of Vienna, in the *Oesterreichische Rundschau* No. 1, has in a most interesting article laid bare the weak spots of the university system of the Austro-Hungarian empire. He suggests radical reforms, and closes with the words: "All those acquainted with the condition of affairs will agree that the universities of Austria are still less able than those of the German Empire to compete with some in other lands. Immediate and ample help is imperatively needed; and both the Ministry and Parliament must be up and doing."

The documents in the "Narratives of Maryland History" (Scribner), recently published in the Original Narratives of Early American History Series, are of a somewhat more miscellaneous character than those included in earlier volumes. Beginning with Father White's "Account of the Colony" and "Relation of Maryland," they cover Baltimore's "Instructions" of 1633, various extracts from letters from the Jesuits, ranging from 1634 to 1681, Leonard Calvert's letter to Baltimore, and Capt. Yong's letter to Sir Toby Matthew concerning the Claiborne controversy, selections from the journal of George Fox, Augustine Herrman's journal of 1659, reports of conferences over the boundary line, 1682-1684, and a series of rare and valuable pamphlets, "Lord Baltimore's Case," the same "Uncased and Answered," "Babylon's Fall," and its "Refutation," Hammond's "Leah and Rachel," and Alsop's "Province of Maryland," all of which, though well known, are not readily accessible. No reprints of the entire series are more worthy of commendation than are those concerning that mimic struggle of Royalist and Parliamentarian in Maryland between 1651 and 1655, which reproduced in so many particulars the larger contest in England. The "narratives" selected for the period before 1660 are much more satisfactory than are those which follow that date, and it would have been worth while presenting Baltimore's "answers to queries" of 1678, and extracts from letters elucidating the troubles associated with the murders of Rousby and Payne. Except for the boundary question the period from 1675 to 1689 is here largely ignored. Furthermore, a departure has been made from preceding practice in printing entire the English version of the charter, which might well have been omitted. Mr. Hall, as editor, has done his work fairly well, though his introductions contain a number of repetitions and his notes seem meagre. In the analysis of the charter (p. 68) he leaves the impression that the colonists of Maryland could trade directly "with foreign nations with which England was at peace." The charter does not say this; it states no more than that such trade could be carried on with "any other countreys, being in amity with us," through English ports, a practice never forbidden by the English government, either at this time or afterward.

Probably no portion of Nova Scotia is enveloped to a greater extent in an atmosphere of romance than Kings County, which has been made famous by Longfellow's "Evangeline." To be sure, in the history of Nova Scotia at large there is a certain dramatic interest that belongs to few portions of the American continent. This small province served for more than a century as the chief contending ground of France and England in their struggle for empire in the New World. Nova Scotia, or Acadie, as it was then known, was the scene for decades of petty feudal warfare between rival leaders, among whom were La Tour and D'Aulnay. And there, about the middle of the eighteenth century, thousands of simple French peasants were rudely torn from thrifty homes and dragged into exile. Dr. Arthur W. H. Eaton has recently completed an exhaustive historical work of nearly 900 pages, entitled "The History of Kings County, Nova Scotia: Heart of the Acadian Land" (Salem Press Co.). The author presents a sketch of the French and their expulsion and of the New England settlers who went to Nova Scotia to occupy the vacant farms of the exiled Acadians. This is followed by an extended description of Kings County as it is to-day, attention being paid to its geography, educational facilities, religious bodies, economic conditions, municipalities, and its contribution of eminent men to many fields of human activity. The last half of the volume is devoted to biographical sketches and genealogies, the author having collected and systematized a vast mass of genealogical facts. Despite its rather local bearing, the book attracts by its style and is of engrossing interest to any one who has ever visited Grand Pré and the adjacent country.

In his "Study of Yasna I" (Brockhaus, Leipzig, 1910), Prof. Lawrence H. Mills of the University of Oxford, working on the lines which he laid down in his great edition of the Gâthâs, the oldest hymns of the ancient Persian faith, now turns to what all scholars in the Indo-Iranian field have long felt needful—a like investigation of the later records of Zoroastrianism. Accordingly, we have, in the "Study" before us, a full transliteration and translation not only of the original Avesta text of the first chapter of the "Yasna," but also similar transliterations and translations of its old versions in Pahlavi and Sanskrit, together with the transliteration of the Parsi-Persian text, and, as an appendix, the editor's own translation of the Avesta into the closely kindred Sanskrit. Notes and careful collation of manuscripts add to the value of the treatise, and its worth is increased by prefaces dealing with the method of interpreting the Avesta and with the problem of its alleged reconstruction during the Sasanid period.

Miss Anna Callender Brackett, who for years conducted one of the leading private schools of this city, died last Sunday at Summit, N. J. She was born in Boston; was graduated from the State Normal School at Framingham, Mass., in 1856. She returned thither as a teacher after some experience in that work at Brookfield, Mass. In 1859 she became vice-principal of the Girls' High and Normal School of Charleston, S. C. At the outbreak of the civil war she returned to the North, and, after a year as assistant in the High School of Cambridge, Mass., was made principal of the City Normal School of St. Louis, where she spent nine years of singularly effective work. Her school for girls in New York was established in 1872. Miss Brackett was the first woman principal ever appointed in any normal school. Her school here was the first in New York to demand from every girl some study of Latin as the best mental training, as it was the first to put German into the regular course of study and to rescue it from its subordinate position as an "extra." Besides her professional work, she was engaged almost continuously in writing on educational and other topics. Her "Education of American Girls" appeared in 1874, "Poetry for Home and School" in 1876, a translation of Rosenkranz's "Pedagogies," under the title, "The Philosophy of Education," first published in 1872, was revised and reprinted in 1886. Her contributions to the *Journal of Speculative Philosophy* were reprinted in a separate volume. A translation of Hegel she made for her own advantage. Her poems, which for a long time appeared in the chief journals and magazines, never were collected. She was an effective writer on many subjects, and for years was an important contributor to the *Evening Post* and *Nation*.

Dr. Ferdinand Regelsberger, whose death is announced from Göttingen, in his eighty-first year, was professor of Roman and German law, and the author of "Zur Lehre vom Altersvorzug der Pfandrechte," "Die Vorverhandlungen bei Verträgen," and "Pandekten."

Science

Esprits et Médiums. By Th. Flournoy. Paris: Fischbacher. Pp. 560.

Professor Flournoy, who is in the faculty of sciences of the University of Geneva, brings together in one volume his valuable but scattered and not easily accessible studies in "metaphysics" and psychology. The first part (200 pages) is the report of his investigation, made some years ago, of Geneva "Spirites"—mediums and mediumist phenomena, in all sixty-three cases, of which nine were supplied him from abroad. The author modestly describes this as not rigorously scientific and as made up of accounts and observations of no great value in themselves, but giving a just idea of the variety of phenomena current among spiritists. From the beginning he protests against the Anglo-Saxon confusion of "spiritism," the pretended scientific explanation of certain facts by a supposed intervention of spirits of the dead, with "spiritualism," which should be used to indicate the philosophic and religious mental attitude that founds on considerations of values a belief in the absolute reality of

conscious individualities and their further development in some other economy as a necessary postulate to every moral conception of life. More briefly, non-English writers by "spiritualist" mean any one who believes in the spirituality and immortality of the soul as opposed to materialists:

> So far as I can judge from my experience and reading, spiritism is a complete error. . . . Most of the phenomena are easily explained, and without residue, by processes inherent in the mediums themselves and their surroundings. . . . This is what may be called the *ludic* or scenic theory of mediumship, as against the diabolic theory maintained by Catholic theologians and the spiritist theory of the intervention of the dead.

Professor Flournoy seems not to know the classical application to constantly recurring religious phenomena of a theory similar to his own in the philosophic treatment of "the discretion of spirits" by Catholic and older Protestant theologians. Shakespeare, faithful to the mental habits of his time, clearly distinguished between the "spirit of health" and the "goblin damned" when he raised up from purgatory the "spirit" of Hamlet's father, "doom'd for a certain term to walk the night." To such "haunting" by spirits, allowed by special Providence, were added apparitions of angels and saints, warranted by Scripture and in no sense diabolic. This chiefly interests literature and the history of ideas; but present science could also profit by the theologians' minute observations of hallucinations, self-illusions, and cerebral vapors from over-fasting or concentration of mind, while little could be objected to their common-sense principles derived from unequalled opportunities of observation and experiment in spiritual direction.

The main conclusion of our author has a more than century-old parallel in our classic English literature of religion. Professor Flournoy says:

> As to the supra-normal incidents which so often mingle with mediumistic phenomena —and which Spiritism interprets as implying the participation of extra-terrestrial intelligences—in so far as they are truly supra-normal and not reduced to errors of observation and the rest, they do indeed indicate a whole domain of forces or laws which are still mysterious, but in which nothing has yet really proved that disembodied spirits have the slightest part.

Samuel Johnson, speaking in 1778 of John Wesley's proof that a ghost knows our thoughts, remarked: "I am sorry that John did not take more pains to inquire into the evidence for it." Miss Seward (with an incredulous smile): "What, Sir, about a ghost?" Johnson (with solemn vehemence): "Yes, Madam; this is a question which, after five thousand years, is yet undecided: a question, whether in theology or philosophy, one of the most important that can come before the human understanding."

Andreas Vesalius the Reformer of Anatomy. By James Moores Ball, M.D. St. Louis. Medical Science Press. $5.

American studies of the history of anatomy are as yet far from frequent. This handsome book with its numerous illustrations is not only welcome evidence of an awakening interest in such pursuits, but is also a very exceptional and admirable specimen of the art of the printer. Dr. Ball undertakes to sketch the career of Vesalius and his relation to his time, as well as to his more immediate predecessors and contemporaries in medicine. This is done with no pretence of any profound examination of the record or search for new material.

In reality somewhat less than half the book is given up to Vesalius himself, and the reduction of the text by liberal margins and the pictures makes the story rather brief. For the biography Dr. Ball frankly admits his obligation to the exhaustive work of M. Roth, in 1892; in fact, these chapters are largely a very clever rendering and skilful abridgment of Roth's more ponderous narrative. The version is not always quite accurate, as, for example, in saying (p. 79), that Vesalius during a visit to Bologna engaged with Curtius in a deep study of venesection, while Roth describes the affair as "eine heftige Auseinandersetzung." There are other discrepancies, but few appear to be of such great importance as the author's acceptance of some doubtful dates as quite certain, and his perpetuating an explanation of the fateful pilgrimage to Jerusalem which has been rejected by careful investigation.

The illustrations, derived from many sources and reproduced by photographic methods, include a number of portraits relating to the text. The vagueness of some of these is almost the only blotch on the typographical excellence of the book. There are also various figures and plates from other anatomical works of the period which show clearly how great a step forward was taken by Vesalius. Of the Vesalian plates, there are four for muscles and one for the skeleton, each reduced one-half and well copied. These plates are all from the *Fabrica*, from which three interesting initials and a few minor illustrations are also taken. Of the pictures in the *Epitome*, only the title-page and the portrait are given. Concerning the personality of the artist, Dr. Ball appears to have no doubt; he unhesitatingly attributes everything to Jan Stephan van Calcar. The Titian tradition is summarily dismissed as improbable on account of his age. The conclusion of Roth that Vesalius made the drawings or at least had a share in the work, Ball hardly considers as seriously as it deserves, and casts it aside, because he does not see how the anatomist could have found time to be also the artist.

In gingham gown come two more of Olive Green's cook-books from the Putnam press. "Everyday Desserts" contains 500 pages; "Everyday Dinners" is an epitome of the specialized volumes preceding it, and completes the Homemaker Series—ten in all.

Sturgis & Walton's science books include: "First Aid To Nursery Ailments," by Evelyn Lincoln Coolidge, M.D.

Dr. William S. Sadler's "The Physiology of Faith and Fear" is in the list of A. C. McClurg & Co.

The D. Van Nostrand Company, New York, has issued a number of books on the applications of electricity. Two of them are for amateurs of a rather advanced standing. The one by Alfred Powell Morgan on "Wireless Telegraph Construction for Amateurs" gives the detailed and systematic information necessary to build a private or experimental wireless telegraph station. If the amateur is interested more in the construction of coil, condensers, etc., than in overcoming the many perplexities incident to an efficient use of such a telegraph station, the book will be useful. But on the whole, now that such apparatus is comparatively cheap, it is better to buy these and spend one's time and ingenuity on the real problem in hand. The average amateur would be discouraged before the station was ready for operation if he attempted to make for himself all the requisite apparatus. The book would be improved by a more complete description of wireless appliances and a discussion of operations with references to other standard books. The other book for amateurs is one on the construction and use of "The Tesla High Frequency Coil," by George F. Haller and E. T. Cunningham. The authors, who are themselves amateurs, describe a seven-inch and a twelve-inch Tesla coil which they constructed. The completed apparatus is not very novel, and the chapter on the use of the coil is rather trifling and not accurate. The style of the authors may be judged from this sample: "It is not the easiest subject to experiment in by any means, on the other hand it is the most difficult." It might also be added that such coils in the hands of amateurs are rather dangerous when exhibited as "thrillers" to popular audiences.

Mme. Laurence Fiedler, who first came to this country in 1907, with a special commission from the French government to study the work which had been done to root out tuberculosis, and to attend the conference held that year in Washington, died Sunday in New York city, aged forty-seven. She was the founder of the Society of Champrosary for Rural Curés, a sanitarium with agricultural household schools for the ill children of Paris, and labored in behalf of the Red Cross. For her work, she was congratulated officially by the Academy of Medicine of France. A few months ago, she returned to New York in the interest of the Franco-American Society, which aims to strengthen the commercial relations between France and the United States. She had been decorated by the French government for her studies in economics and sociology.

Drama

SCENERY AND DRAMA.

During the past six months a number of well-known French artists and critics—Albert Bernard, Henri Marcel, Jules Clairin, and others—have been discussing the "new impressionism" in theatrical decoration, as exhibited in certain "spectacles" produced last season upon the Russian stage. The aim of it is "to create an atmosphere of colors harmonizing with the spirit of the presented play." To procure this it is demanded that the management of the lights and the costumes of the performers shall be subject to the direction of the scenic artist, a provision which, for manifest reasons, would be utterly impracticable except in special instances. Among such exceptions would be included fairy tales, and such pieces of fantastic imagination as the earlier works of Maeterlinck and delicate poetic visions. It should be noted that the Russian experiment is confined, apparently, to spectacles. There is an impressionistic stage also in France, that of the Théâtre des Arts, and Jacques Rouché, its director, has embodied his views on the subject in a little volume entitled "Modern Theatrical Art." Moreover, he has demonstrated his faith in his theories by employing two artists, Messrs. Dethomas and Dresa, to illustrate them in the production of two pieces, "Le Sicilien" and "Carnaval des Enfants."

These artists have explained the principles which guided them in their part of the work. M. Dresa, who had charge of "Le Sicilien," says that his main object was to throw into the boldest possible relief the brilliant and picturesque costumes of the performers. Therefore he provided a background of cool blues and grays, without attempting to create any realistic illusion or exact color. Where he had to represent foliage or buildings he did no more than suggest them, relying upon the actors, as he expresses it, to supply the more definite strokes of the brush. M. Dethomas, the artist of the "Carnaval des Enfants," says that as the spirit of the actual drama, in strong contrast with the general joy of its environment, was bitterly sad, he provided scenery of the utmost simplicity—being careful only to preserve a general harmony—that the work of the dramatist and his interpreters might have the fullest value.

The artistic motive in all this need not be doubted, but if this be the sum of the "new impressionism," it does not seem to contain much that is either new or valuable. As a matter of fact, impressionism has always been a factor in the making of stage scenery. It is susceptible of development, but it can never again be new. Gordon Craig, son of Ellen Terry, has long been preaching it in a far more advanced form than M. Rouché, M. Dethomas, or M. Dresa appears to have dreamed of. He even contemplates the obliteration of the visible actor altogether, a consummation, in some cases, devoutly to be wished. He would substitute manageable puppets, with competent speakers behind his symbolistic and Rembrandtesque stage sets. His ideas concerning mechanism and lighting have been adopted in European theatres. Any movement likely to do away with the crudities in form and color which often disfigure the most expensive scenery in the modern theatre will be highly welcome, but the notion that the interpretation of drama—except in very special instances—can be made more artistic, vivid, or veracious by a calculated and arbitrary observance of color schemes—of nocturnes and symphonies—is simply nonsensical.

It is, however, only in its vagaries, whether in the theatre, or painting, or literature, that impressionism is to be derided. On the stage it always has had and always will have its legitimate opportunities. More than fifty years ago Samuel Phelps made a notable use of it at Sadler's Wells, when, in his famous production of "A Midsummer Night's Dream"—on a stage devoid of all modern appliances—by a dexterous use of lights and gauzes, he clothed the fairy episodes with an appropriate and poetic insubstantiality. But it could never have occurred to him to set a blood-red or sea-green chamber for the murder of Desdemona. It is to such extravagances that impressionism in scene painting—unless inspired by positive genius, which is rare—would inevitably tend. The modern manager quickly would discern in it an excuse for cheap and gaudy slovenliness. He would never pay the fees which would be demanded by a first-class artist. The days of Beverley, Telbin, and Clarkson Stanfield are over.

There is undeniably an abundance of gorgeous and expensive scenery upon our stage; very little that is really appropriate or artistic. In the "interiors" prodigality is too often mistaken for taste, while the landscapes are riotous with flaming or unseasonable colors. Time and more money are wasted annually upon unnecessary and frequently unsuitable costumes. All this largely unprofitable cost operates in deadly fashion against dramatic growth and progress. It is the result of the suicidal policy which vainly seeks, by mere glitter and display, to make bad plays and worse performances look like good ones. It was the younger Kean, a second-rate actor, but an astute and capable manager, who originated and for a long time prospered by this plan. He, however, had good actors to support him, presented great plays, and strove for artistic beauty and historical accuracy. Other players, ignoring his artistic conscientiousness, his industry, his ambition, and his solid achievement, discerned only the fact that an inferior performer had won wealth and renown by giving to standard plays, on which there was no copyright, a splendid setting. His retirement marked the beginning of that long series of Shakespearean and other revivals, on both sides of the Atlantic, in which mere spectacle—copying or enlarging upon Kean's details—was offered as a substitute for acting. In forty years, Henry Irving has been the only man on the English-speaking stage to furnish a completely worthy performance of a Shakespearean play. This was his first production of "The Merchant of Venice." Edwin Booth was a genius, who blazed his own way without regard for accessories.

It would be rash to declare that the only drama that counts, the drama of human or literary significance, derives no aid from elaborate scenic environment, but it is undeniably true that the decay of the art of acting—so far as the higher imaginative drama is concerned—has advanced as the costliness of decoration has increased. The process has been continuous since the period of the Kembles. When they played "Henry VIII" contemporary critics waxed eloquent over the acting; now that Sir Herbert Tree has revived it in his turn at His Majesty's Theatre, the critical talk is all about the magnificence and the educational influence of the pageant. Herein is a convenient illustration of what has been going on in all the theatres, since the retirement of John Philip Kemble and Mrs. Siddons and the exit of Macready. Acting and speaking are already almost lost arts, but they would vanish altogether with the imaginative painter in full control and the players mere items in a color scheme.

One of Baker & Taylor's announcements is "An Autobiography of William Shakespeare," by L. C. Alexander.

The New Theatre announces a series of four afternoon performances illustrating the development of the English drama, and consisting of scenes from plays of various periods, each presented in the manner of its time, with introductory lectures by Brander Matthews, professor of dramatic literature in Columbia University. The subjects and dates are as follows: (1) Monday, March 27, The Beginnings, a mystery play ("Sister Beatrice"), a morality play ("Nice Wanton") and an interlude ("Four P's"); (2) Thursday, March 30, Shakespeare's time—scenes from "The Winter's Tale," on the Elizabethan stage; (3) Monday, April 3, The Old Comedy Period—scenes from "The School for Scandal," with settings of the time; (4) Friday, April 7, The Contemporary Form—scenes from Pinero's "The Thunderbolt."

Martin Harvey announces that the version by W. L. Courtney of the "Œdipus Rex," which he is preparing to produce, is a

free rendering of Sophocles, but with the addition of a prologue showing the murder of Laius and the fourth act from "Œdipus Coloneus." The probable date of production will be early next year.

Messrs. Vedrenne and Eadie will open the London Royalty with a new piece by Jerome K. Jerome, entitled "The Master of Mrs. Chilvers." It is on the theme of woman suffrage, but takes no sides. Pros and cons are more or less adroitly balanced, but there is said to be an exciting climax and an unexpected ending.

Fred Terry has procured the New Theatre in London until July, 1912. He is said to meditate an elaborate revival of "Romeo and Juliet," in which his daughter, Phyllis, will be the heroine. If this actress has the genius with which she has been credited in London, her youth and beauty ought to help to make her Juliet a memorable impersonation. Henry Ainley will be the Romeo.

Laurence Irving seems to be making strides in his profession. The English critics have paid much favorable attention to him lately. One of them says of his performance of the selfish and profligate father in "The Lily":

Mr. Laurence Irving is advancing by leaps and bounds. His skill is growing with every part he plays, and the temperamental force he exhibits in humor and in tragedy is becoming one of the things on which we count in the theatre. His acting has the appearance of absolute spontaneity. Words and movements seem to be entirely things of the moment. His Comte de Marigny is an astonishingly fine performance.

The London Play Actors have produced "Married by Degrees," a piece by A. P. Sinnett, founded upon the notion of a pretty girl having a double personality. As Lucy she is modest and religious, as Leonora she is otherwise. What she does under the influence of one personality she forgets when governed by the other. Naturally, she becomes involved in curious complications, of which the stage effect is said to be exceedingly funny. The piece has been received with shrieks of laughter, but appears to have no other value than that of rollicking farce.

Johanna Redmond, daughter of the Irish M.P., John Redmond, is the author of a tragic little play that has just been produced successfully in one of the London halls. It relates an imaginary incident in the Emmet rising of 1805. An old Irish couple sit in their cabin awaiting news of their two sons, who, with four other men, have been arrested for rebellion. Presently one of the sons enters, travel-worn, despairing, and haggard, to tell how he had been induced by his captors to turn informer on the promise that his brother Shamus should be set free. After giving the testimony that cost the lives of four of his companions, he learned that his brother, Shamus, had long been dead of a fever, and that he had been foully and cruelly tricked. His parents forgive him the treachery, but he will not be comforted, and he goes out into the night, a broken-hearted wanderer. W. G. Fay was the principal performer.

Oscar Asche is now busily engaged in the preparation of "Kismet," the Oriental drama written for him by Edward Knoblauch. He plays the part of Hajj, a beggar. The piece starts at daybreak with Hajj prone upon the steps of a mosque, and finishes at midnight with him in precisely the same position. Meanwhile, he has killed two of his enemies, rescued his daughter, Marsinah, from the clutches of the villain, and performed many other deeds. One scene represents the bathroom in a harem with real water and women disporting themselves in it. Here it is that Hajj does to death his most inveterate foe by a process of slow drowning. There is further, a vivid picture of an Eastern bazaar; also a scene in the Caliph's audience-chamber in which Hajj is called upon to prove his skill as a juggler. When the curtain falls upon an act the story will be continued in front by means of dumb show.

The death of Frederick Haase can scarcely be said to inflict a great loss upon the German stage, for he had long ceased to act in public, but for many years he was recognized as one of the most versatile and accomplished players of his day, and his reputation extended over the greater part of the civilized world. He was a popular favorito in St. Petersburg and New York, as well as in Berlin. And he fought his way to the front rank, in spite of the physical disabilities which at one time seemed to make a successful stage career impossible for him. He was born in Berlin on the 1st of November, 1826, and was attracted toward the theatre in early youth. To qualify himself he studied for two years under the direction of the poet, Tieck. It was in 1846, in Weimar, that he made his first public appearance. For a long time his progress in his profession was impeded by an imperfection in his utterance which was only overcome after years of struggle. His earliest successes were achieved in Munich, Prague, and Karlsruhe. After that he travelled extensively, gradually acquiring recognition as a most capable, versatile, and impressive actor in romantic and character parts. In the great tragic characters he was less admired, the critics charging him with seeking to supply by mere violence and extravagances the lack of the profoundest emotional power and inspiration. He finally made a great hit in Frankfort, and soon afterward he received flattering offers from St. Petersburg, where he passed six winters, winning many triumphs and adding greatly to his fame. Returning to Germany, he became director of the Court Theatre at Coburg, which post he held in 1867 and 1868. It was in the following year that he paid his first professional visit to the United States, where he received the welcome due to a great artist, eminent in all departments of the drama. He charmed by his ease and elegance as a comedian, his fervor as a lover, and amazed by his infinite variety. From 1870-76 he occupied the important position of director of the Municipal Theatre in Leipzig, winning the highest praise, both as actor and administrator. In 1882 he visited the United States for the second time, appearing in a number of classic and more modern characters, and renewing the triumphs of his previous visit. Ten years later, in his sixty-sixth year, he retired from the theatre into private life. Even if a full list of his impersonations were at hand, a mere enumeration of names and titles would be tedious. Among his most admired embodiments were those of Wurm, in "Kabale und Liebe"; Carlos, in "Clavigo"; and Mephistopheles, in "Richard III," while he was inimitable in "A Party at Whist" and other pieces of a similar kind, in which eccentric character could be illustrated by minute and delicate detail, high technical skill, and artistic polish. During his career he was associated with all the most famous theatres in Germany, and he was the object of innumerable honors and decorations.

Music

Studies in Musical Education, History, and Æsthetics. Fifth Series. Published by the Music Teachers' National Association, Hartford, Conn. $1.60.

Shortly before his death Joachim declared his belief that the country destined to lead in music of the near future was America. Doubtless he based this assertion on his experience with talented American pupils at the Royal Academy of Music, in Berlin, of which he was the director. Had he ever visited this country and studied our musical annals, he might have found another reason for his statement in the extraordinary rapidity of our musical development. As President W. E. Huntington pointed out in his address of welcome to the members of the Music Teachers' National Association, at their thirty-second annual meeting, the first organ used in America was placed in King's Chapel, Boston, in 1711. The first public concert in that city was given in 1731, and it was not till 1815 that the first organ choral society, the Handel and Haydn, began its career.

The eminent Philadelphia critic and author, Philip H. Goepp, relates in a paper on Music Appreciation as a National Asset that he made a special study, a few years ago, of open-air summer music in German cities and resorts, and found that "nowhere in Germany were there regularly held such excellent concerts for large audiences in the open air as in certain places in America"; for instance, at Ocean Grove, N. J., where throughout the long summer an auditorium of colossal size houses a large chorus and an adequate orchestra in a continuous series of great concerts. Mr. Goepp points out, on the other hand, one respect in which we are still in a certain state of barbarism—far behind the other nations. It is the indifferent attitude toward music of men who not only confess without chagrin their absolute ignorance of this art, but do so with a certain touch of swagger. Such a Philistine attitude must be overcome; but how? Mr. Goepp thinks that our orchestral conductors and programme makers are largely responsible, and that the remedy lies in their hands. They give to certain classical masters rather more than their true meed and devote the rest of their programmes to sensational novelties which astonish

but do not delight, neglecting the "minor poets," whose best music of the lighter kind would help to lure men to concert halls. More stress should be laid on the folk-element, which is so conspicuous in many of the lighter works, and in not a few of the more ambitious. It is human and appealing. To the composers who lament that we have so little folk-music of our own, Mr. Goepp replies that this lack is rather a gain: "for we are heir to all the strains of folk-song of the civilized world, and not limited to a single, narrow rut. It seems to be our destiny to lead in the glorious merging of them all."

Our public schools are doing much to make children musical, and probably, when the boys of to-day are men, they will be more interested in music than their fathers are. There is in this volume the usual Report of Public School Conference, discussing various phases of the subject, emphasis being placed, among other things, on the fact that the school should in every way encourage the children to sing their songs at home. Home-made music is what we need most; and this has been contributed after a fashion by the aid of the multitudinous mechanical players and singing machines. "Caruso on tap in every hamlet in the land; Grieg returning from the dead at the tyro's bidding! symphony concerts in every rich man's palace, to amuse his infants or entertain his guests"—what influence is all this exerting on musical culture? George Coleman Gow of Vassar College discusses this question at length and without professional bias. He sides with the public in preferring Paderewski as reproduced on the pianola to Peter Piper stumbling over the keys of his piano; sees the great educational value of these instruments in making the millions familiar with all kinds of music, including the best; but also emphasizes the fact that there is plenty of music which wholly transcends any limit to which these instruments have approximated as yet. The best manufacturers are aware of the defects and are doing all that an enlightened business instinct can to remedy them. Mr. Gow believes that as the clavier drove out the lute, as the piano dispossessed the cottage organ, so some more perfect interpreter of musical loveliness will crowd to the back the punctured roll.

One aspect of the case is referred to in another paper by H. W. Gray. Just as the Japanese do not themselves dance, but get girls to dance for them, so in this country the majority of persons prefer to pay some one else to make music for them. This tendency is, of course, promoted by the singing machines, which on that account may be objectionable. However, even the piano itself does not escape slander; in a paper on its influence, Francis L. York tries to show that "in many ways the piano has been and still is a curse to music." Incidentally, he makes an erroneous statement—that "Wagner almost constantly used the piano when he composed." In truth, he used it only when writing his earliest operas. Hans Richter lived in the same house with him, near Lucerne, when he was composing the "Meistersinger" score, yet for several months did not hear him touch the piano.

We have mentioned only a few of the papers, but might have dwelt with equal advantage on a dozen others—among them "The Possibilities of the Modern Organ," "Modern Tendencies in Choral Writing," "The Function of the Concert Room," "The Ethical Note in Modern Music Literature," "The State Certification of Music-Teachers," "The Music Collections in the Boston Public Library."

Carl F. Price's "The Music and Hymnody of the Methodist Hymnal" is in the hands of Jennings & Graham of Cincinnati.

A. C. McClurg & Co. promise this spring "Old English Instruments of Music: Their History and Character," by Francis W. Galpin, and "Master Musicians," by J. Cuthbert Haddon.

Preparations are in progress for the London Musical Festival, which will be held May 22-27.

Mary Cracroft, whose pioneer work of introducing new or unknown music has made her well known in England, and whose programmes of Debussy and of the Russian composers have proved to be of much interest, was heard in recital at Mendelssohn Hall on Monday afternoon, March 20, when her programme contained seven pieces never heard by New York audiences and a number which, though familiar to us, received their first rendering in England at the hands of Miss Cracroft. Miss Cracroft is to tour America next season.

Art

THE WINTER ACADEMY.

The eighty-sixth annual exhibition of the National Academy of Design shows the inevitable defects of crowding due to its cramped quarters, but is as a whole the most attractive Academy within the memory of the present writer. Its appeal is the expression of its limitations. Landscape dominates the show. The dead spots caused by official portraiture are almost absent. Exceptional, too, is the non-appearance of those deft and smoothly licked figure subjects that derive from Beaux Arts traditions. Little of the painting is in any way distinguished as vision, but the bulk of it shows at least competence and zest in execution. One might gather that our art was quite exclusively one of vigorous and objective landscape, but the impression rests in part upon the abstention of those painters who deal most successfully with *genre*. The one-sidedness of an art that occupies itself chiefly with landscape unreflectively seen and swiftly executed has frequently been noted in this column, and no repetition of so obvious a homily is necessary. Let us take the show quite genially for what it is, and we shall see that its collective importance on the whole outweighs that of individual contributions.

On the long wall of the Vanderbilt Gallery are arrayed canvases by Gifford Beal, Robert Reid, Childe Hassam, Ernest Lawson, Elmer Schofield, Cullen Yates, Emil Carlsen (a fine still life), William Ritschel, Groll, and, holding its own in spite of its less emphatic manner, one by W. L. Lathrop. There is no great picture, but the ensemble is distinctly impressive. One doubts whether any current European exhibition could in like space excel this display for sound, vigorous, and intelligent craftsmanship.

Whether Hawthorne's The Trousseau, which triumphantly wins the Thomas B. Clarke Prize, is a great picture only time will tell, but it would be a craven critic who should meanwhile deny the title to so strong, sweet, and thoughtful a work. A girl bride stands being measured for a frock. Her beautiful hands are clasped upon her white petticoat. An extraordinary impression of consecrated expectant womanhood irradiates from her young face and from her superb nubile form. One hardly notices the withered, intent face of a seamstress behind, who takes a measure with sacramental earnestness, nor the sweet profile of a young mother sewing in dreamy unconsciousness. The first impression of this lovely work is so keen that one scarcely sees the beautiful and authoritative painting of the olive flesh, the enchanting blue shadows of the white bodice and petticoat, and the sober iridescence of the figured stuff that is to clothe the young bride. This picture does more successfully the sort of thing that has made Dagnan-Bouveret famous. At last Mr. Hawthorne has made his fine execution fully expressive. The picture has been bought by the Metropolitan Museum and the honor is well merited.

The importance of this picture has forced us to begin with the smallest category, that of figure painting and portraiture. Otherwise there is little to detain one in the class except Sergeant Kendall's capital portrait of two little girls, MacCameron's effigy of Rodin holding the bronze of the smaller *Penseur*, Hilda Belcher's head of a girl, Jean McClean's figure of a seated girl, very clever and sensitively so; W. Sherman Potts's portrait of the poet Ridgely Torrence, and Brush's head of little Miss Betty Holter, a picture which just escapes banality and illustrates that relishable kind of sophisticated primi-

tivism which we find in the children's portraits of Bronzino. Materially the most important picture in this class is Johansen's In a Garden. We have the familiar assemblage of diaphanous young women with a greyhound, all confected in liquid amber. There is beautiful and uncommon quality of color in Andrew T. Schwartz's decorative composition, Hope, Destiny, and Despair.

Of pictures of town life and scenery, George Bellows's New York is the most striking. With amazing cleverness he has held together his ragout of sky-scrapers, elevated trains, tram cars, trucks, automobiles, sky signs, and harassed hurrying mortals. The whole is felt with a fine Olympian detachment, with a distinct scorn of the stridency and haste so ably denoted. Again Mr. Bellows declines to be taken for granted or even to be measured by himself. Jerome Myers shows his customary intimacy with the collective life of city children in his small picture, The Park Swing; and in the Religious Fête, a most vivacious and original mosaic of color, reveals a mood not far from that of caricature. The picture achieves that complete emancipation from linear methods which is the goal of the neo-impressionists. Louis Cohen's Puente St. Martin, Toledo, is a good example of romantic town scenery large in scale and broadly painted.

Landscape is pretty well, but not quite, exhausted by our summary roll call of the battle array in the Vanderbilt Gallery. A pathetic and commemorative interest attaches to Worthington Whittredge's In the Woods. This little canvas by a former president of the Academy is a last survival of that method which made the Academy, if not great, at least more American and popular than it has ever been since. J. Francis Murphy, who pursues the quest of simplification *à outrance*, Leonard Ochtman, and Ben Foster, in a glimpse of fading sunset through sombre pines, renew old and tried pleasures. Gardner Symons repeats his panoramic mood in pictures very pleasing in color, but deficient in inner structure. Charles Rosen contributes what in the opinion of the present writer are the two most remarkable landscapes of the show. He achieves effects of silvery light without losing the warmth of sunfilled atmosphere. Much may be expected of this growing and ever experimental painter. You could hang his canvases Along the Delaware, and A Shaded Bank between two fine Corots, and both artists would gain from the juxtaposition. It would emphasize the classic and schematic nobility of the older painter and also the more sensitive naturalism of the contemporary man. It is an anomaly that the Academy lacks a painter of this quality.

Landscapes by three artists whose work is unfamiliar to me, George M Bruestle, Charles Bayley Cook, and Edward McDowell, gave me much pleasure. Bruestle has an uncommonly emphatic and intelligent way of asserting the chief planes of his pictures and reverberant color slightly mannered perhaps; Cook's snow covered gorge is well composed and is carved out of the paint with exhilarating energy; McDowell's hills clasp their lake firmly, and the sense of saturation in low lying rain clouds is expressed with admirable simplicity. Sculpture occupies its usual incidental position. Except for two capital lolling bears by Roth and good portrait heads by Mrs. Heyworth Mills, Olga Popoff, John Flanagan, and Mahiuri Young, nothing seems very striking in this department.

The Thomas B. Clarke prize for the best figure composition was awarded to Charles W. Hawthorne for his admirable picture The Trousseau. The first, second, and third Hallgarten prizes were bestowed respectively upon Lillian Genth's Depths of the Woods, a tiny nymph about to bathe in very treacly water; Joseph T. Pearson's solitary goose (a widow?) standing Under the Weeping Willow; and upon Leslie P. Thompson's interior entitled Tea. The Inness gold medal for the best landscape went to Elmer Schofield's vigorous snow scene, February Morning. John C. Johansen's In the Garden received the Saltus Medal, and Mary van der Veer's quietly charming interior, The Geography Lesson, the Julia A. Shaw memorial prize.

While this exhibition is attractive and well worth a visit, its excellence depends largely on prudent omissions. Good luck or good management has eliminated most of the perfunctory and commercial work that usually carries the average down. Moreover this uncommonly harmonious show suffers badly from crowding and damaging juxtapositions. It eloquently points the need of galleries adequate to house a really comprehensive and representative exhibition.

F. J. M., Jr.

Frederic Fairchild Sherman's new publications include: "A Painter's Holiday and Other Poems," five imaginary monologues by Bliss Carman, now for the first time published in book form, and "George Inness, the man and his art," by Elliott Daingerfield.

Mr. Arvanitopoulos, ephor of antiquities in Thessaly, has been conducting excavations at Gonnos, at the foot of Olympus, exactly opposite Tempe, where he has had the good fortune to find many objects of importance. Foremost amongst these is a round temple of Athena. Fragments of the statue of the goddess also came to light, one of which is inscribed with the name Xenocles, either the dedicator or sculptor of the statue. There were also found inscriptions and decrees bearing on the history of the place. The local authorities have decided to build a museum on the spot for the reception of the finds.

The death is reported of Louis Alexandre Bouché, aged seventy-three, a French landscape painter, and a disciple of Corot.

Ernest Crofts, whose death is reported from London in his sixty-fourth year, was well known as a painter of military scenes. He was made an associate of the Royal Academy in 1874 and later an active member. A list of his paintings includes: On the Morning of the Battle of Waterloo; Ironsides Returning from Sacking a Cavalier's House; The Evening of the Battle of Waterloo; Marlborough After Ramillies; Execution of Charles I; Gunpowder Plot; and Queen Elizabeth Opening the Royal Exchange.

Finance

A NEW TURN IN EVENTS.

When it became generally recognized, a year ago, that the country's position on international exchange was one influence in the derangement of our markets, there was some variation in ideas as to how that position should be corrected and how long it would take to do it. In the three months ending with March, 1909, exports had exceeded imports by $67,000,000; in the same months of 1910 imports ran ahead of exports by $13,000,000. Between June, 1909, and April, 1910, the export excess fell short by more than one hundred millions of any other corresponding period since 1895.

The foreign trade statement for last month, published on Tuesday of last week, shows how far that situation has already been reversed. February's excess of exports over imports has been exceeded only once in any February of our history. For the eight completed months of the fiscal year that excess not only runs $230,000,000 beyond the same period a year ago, but actually breaks all records in our history but three—which occurred in the fiscal year 1908, when panic distress had forced us to sell to Europe all that we could, on Europe's terms; in 1901, when the greatest foreign balance in our history was heaping up, and in 1898, when the course of events had already inspired European public men to warn their people against the "American invasion."

Last March three remedies for the unfavorable position were proposed by financial doctors. Some held that prices for our export staples must be brought down, and sales to the outside world increased by forcing the foreign market. Others argued that imports should be checked by reduction of prices on home markets. Still others contended that the whole embarrassment would be solved if we could sell enough of our new securities abroad to make up for the adverse balance on merchandise account.

As matters have turned out, all three of these remedies have been administered. The last-named remedy was the

first applied; the result, during the twelve months past, being sales of upwards of $200,000,000 new American securities to Europe. Ordinarily, it might have been imagined that, where the proceeds of such sales were needed for home expenditure, now or later on, they would have been transferred to the New York money market. But, by a rather unusual turn in the situation, money put out temporarily on the open market has commanded a better rate on Lombard Street, this season, than on Wall Street. Therefore these large accruing balances have been left abroad; they are the basis for the estimate, frequently heard on the London market, that New York is directly lending $50,000,000 on that market and is indirectly lending an even greater sum, through the holding by Wall Street banks of sixty-day drafts on London.

The foreign credit established by these security market operations would have made up perhaps two-thirds of the recent shrinkage in the merchandise trade balance in our favor, as compared with recent prosperous years, had the merchandise movement of the past twelve months remained just what it was the year before. But the other remedies also were being simultaneously applied. Tuesday's trade statement showed that, in the eight months ending with February, merchandise exports had increased $224,000,000, reaching by far the highest recorded figure for the period. Imports, in the same time, had been cut down $5,500,000. Nearly one-half of the increase in export trade has occurred in the past two months; in which, moreover, imports have been reduced $10,000,000.

Such a condition of things, with the radical change in our international position which accompanies it, brings up in everybody's mind two inquiries—first, is this movement to be continuous; second, if it is, what is its general bearing on the financial situation? Sales of securities abroad are likely to continue; nearly $100,000,000 have been placed in the past four weeks. But it is hardly probable that the pace will be maintained in the next few months, and meantime the foreign credits accruing from the sales will be curtailed when other corporation note issues, placed abroad three years ago, mature and are paid off. The merchandise movement is less easy to foreshadow confidently. To the total increase of $224,000,000 in our eight months' export, shipments of cotton contributed $153,000,000; iron and steel manufactures approximately $30,000,000. That is to say, 80 per cent. of the period's expansion in our exports came from those two industries.

Now there is no apparent reason why, if Europe's trade activity remains, our steel and iron shipments should not continue very large; but we can scarcely expect to duplicate the season's experience with cotton. That cotton exports, in the past eight months, should have run $130,000,000 beyond the highest previous record is explained by two circumstances not likely soon to be repeated—the world's abnormally low stored-up supply of cotton, when the season began, and the glaring underestimate of our crop of 1910; 11,426,000 bales by the government's December estimate, as against 11,941,000 by last Monday's authoritative Census returns from the ginneries. Acceptance of that December estimate led the foreign importer of our cotton to pay the highest price in a generation for a total shipment rarely exceeded, even in number of bales, during all the history of the trade.

This circumstance will not soon occur again. Yet even so, the case has some curious points of possible resemblance to the great and continuous expansion of our exports after 1897, which played so notable a part in the period's economic history. In the fiscal year 1898 total exports increased $180,000,000; to which increase the grain trade alone contributed $135,000,000. But grain exports did not soon repeat the achievement of that year. The European wheat famine of 1897, like the European cotton famine of 1910, was an isolated phenomenon. In 1900, grain exports were $71,000,000 less than in 1898; yet our total outward trade had none the less increased $163,000,000 in the period. Increase was general, throughout almost the whole domain of American production.

Supposing the recent increase in our foreign trade to continue, and our foreign credits, as a result of that and of our sales of new securities, to go on piling up; what then? We should certainly have corrected, with the utmost thoroughness, one of last year's unfavorable influences. We should be wholly safeguarded on the side of international exchange, and if revival of industry were to draw heavily, later on, upon home banking resources, we should have abroad a reservoir of credit, available for instant use. If natural conditions also were to favor—something which cannot yet be reckoned on as a certainty—this position on international exchange would be an important contributory influence towards return of real prosperity. But those other conditions are essential for a genuine "boom"; as we learned in sequence to the great foreign credit of 1908, when we boomed things prematurely, and of 1901, when we overdid the booming.

Issue This Week

Bergson's Creative Evolution

Authorized translation by ARTHUR MITCHELL, revised by the author. 407 pp. 8vo. $2.50 net.

The late WILLIAM JAMES, reviewing the French edition, said: "Bergson's resources in the way of erudition are remarkable, and in the way of expression they are simply phenomenal. . . . If anything can make hard things easy to follow, it is a style like Bergson's. It is a miracle, and he a real magician. Open Bergson, and new horizons open on every page you read. It tells of reality itself, instead of reiterating what dusty-minded professors have written about what other previous professors have thought. Nothing in Bergson is shop-worn or at second-hand."

W. J. Henderson's Some Forerunners of Italian Opera

By the musical critic of the "Sun," author of "Richard Wagner, His Life and Dramas," "Modern Musical Drift," etc. A notable book on the Mediæval lyric dramas before Peri and Caccini. Several chapters are devoted to a vivid account of Polizeano's "Orfeo," and its performance.

Helen R. Albee's The Gleam

By the author of HARDY PLANTS FOR COTTAGE GARDENS. This spiritual autobiography takes its title from Tennyson's "Merlin and the Gleam." Tho' it explains a way of attaining spiritual perceptions and knowledge, it is nevertheless both direct and practical. 12mo, $1.35 net.*

The Garland of Childhood

Compiled by PERCY WITHERS.

A little book of poems for all lovers of children. A very attractive pocket volume uniform with the popular THE OPEN ROAD. With illustrated cover linings, flexible covers, full gilt. Cloth, $1.50 net.* Leather, $2.50 net.*

Old Testament Narratives

Selected and edited by DR. GEO. H. NETTLETON of Yale. The King James text without annotation. *New edition for general readers.* 300 pp. 80c. net.*

*Postage on net books, 8% additional.

BEHIND THE SCREENS IN JAPAN

An English Woman's Impressions

By EVELYN ADAM

Crown 8vo. $1.50 net.

The book is no surface picture of Japanese life, but a penetrating study of the country and its people based on a long residence in the land of the cherry blossom. It pierces the thin coat of modernism with which the little brown people of the East have industriously overlaid their ancient customs, and gives an unvarnished account of the sub-surface aspects of Japanese life and character. Every page of the book vibrates with life and scarcely one but has a spice of humor.

QUICKSANDS

A NOVEL

By Fannie Heaslip Lea

12*mo. Illustrated.* $1.20 *net.*

Brilliant dialogue, a subtle sense of the comic and the tragic, a graphic touch in the portrayal of an attractive group of people and their environment, and, in general, a fine artistry, characterize this novel, which presents a recurring problem—a wife out of love with her husband and deep in love with another. How she contrives to save something of honor and happiness from shipwreck is the theme of this engrossing story.

D. APPLETON & COMPANY

29-35 West 32d Street, New York City

THE OBVIOUS ORIENT

By ALBERT BUSHNELL HART, Ph.D., LL.D.

12*mo, cloth,* $1.50 *net.*

The title which Dr. Hart has chosen for his new volume is an admission that, no matter how industrious he may be, no one can learn all there is to know of the most ancient and inscrutable of the continents in an eight months' experience. His book, however, reflects much more than surface impressions. He had unusual opportunities to observe and investigate the actual workings of government and the social systems in Japan, China, and the Philippines; and his comments upon the bewildering and picturesque detail of Oriental life are entertaining and illuminating.

DIAZ: MASTER OF MEXICO

By JAMES CREELMAN

Illustrated from Portraits, Photographs, Paintings, etc. 8vo, cloth, $2.00 net.

This timely volume is more than a biography of the remarkable Mexican President. Besides relating the chief events in the life of Diaz, the book describes the evolution of the Mexico of 1848 into the Mexico of to-day. This is done chiefly through narrating the rise of Diaz from obscurity to prominence, the part which he took in the creation of the modern régime out of the old, and the chief events of his long reign as President of the Mexican Republic, and in particular by a full setting forth of the situation as it exists at the present day in the Mexican Republic. Mr. Creelman had unusual opportunities for gathering material and his book contains a large amount of new data.

EXTINCT MONSTERS AND CREATURES OF OTHER DAYS

By Rev. H. N. HUTCHINSON, B.A., F.R.G.S.

New Edition, Revised and Enlarged. Profusely illustrated. 8vo, cloth, gilt top, $3.00 *special net.*

This popular account of the larger forms of ancient animal life has been thoroughly revised to include the recent discoveries and advances in Paleontology. Originally written as two books, the material is now combined into one volume covering nearly all of the monsters of early days of which anything is known—the dragons, the great fish lizards, the mastodon, mammoth, dinosaur, and elephantine monsters, the ancestors of the horse, etc., etc.

PROPERTY INSURANCE

By SOLOMON S. HUEBNER, M.S., Ph.D.

12*mo, cloth,* $2.00 *net.*

A treatise on fire insurance, marine insurance, corporate surety bounding, title insurance, and credit insurance, with copies of the leading forms and clauses. The principles and the practice upon which the property insurance business is based are clearly outlined, and the book should prove of value and interest to insurance agents and brokers, investigators, students, shippers, and large holders of property.

RAILROAD TRAFFIC AND RATES

By EMORY R. JOHNSON, Ph.D., and GROVER G. HUEBNER, Ph.D.

Elaborately illustrated with Maps, Charts, Diagrams, and Forms. 8vo, cloth, 2 volumes, $5.00 net.

Not an attack on railroads nor a defence of them, but a complete and authentic description of the intricate details of the traffic and rate department. Showing just how tariffs and rates are fixed, how traffic is handled, the organization of the freight and passenger services, freight and passenger classification, express and mail services, the inside workings of the Pullman Company, etc., etc. Written by University Professors and every chapter revised by a railroad expert. Send for a descriptive circular.

PUTNAM'S NEW BOOKS

Little Cities of Italy

Florence—San Gimignano—Monte Oliveto—Pisa—Lucca—Prato—Pistoia—Arezzo—Lecco—Bergamo—Brescia—Verona—Vicenza—Padua—Mantua—Argua

By ANDRÉ MAUREL **With a Preface by Guglielmo Ferrero**

Through the country of Tuscany and Venice, as the two main divisions of his work are entitled, M. Maurel has wandered from town to town, painting in vivid colors his impressions of their historical and artistic aspects, showing with keen insight how closely allied are these, what each owes to the other, and how indebted is the present to both. To the lover of Italy the book will afford fresh delight, and to those whose Italy consists only of Venice, Florence, Rome, and Naples these little sketches will open new and charming fields of interest.

Fully Illustrated, $2.50 net.

The Record of a Vigorous Life

Anglo-American Memories

By GEORGE W. SMALLEY, M.A.

Portrait. $2.50 net.

These reminiscences range over a long period, and are concerned with men of exceptional mark and position in Europe and America whom the author has met, and with events in politics and journalism of which he has personal knowledge. His long connection with the *New York Tribune* gave him an unique experience, and the opportunity of meeting the more prominent men in the two continents; and what he has to say of leading events of the last sixty years is suggestive and more than usually interesting.

John Ruskin

Art Critic, Social Reformer, etc. Being a Series of Lectures given in the University of Cambridge. By ARTHUR CHRISTOPHER BENSON. *$1.50 net.*

"I have written these pages with the desire of provoking a discriminating interest in the man's life and work, with a desire to present a picture of one of the most suggestive thinkers, the most beautiful writers, and the most vivid personalities of the last generation."—*From the Preface.*

In the Time of the Pharaohs

By ALEXANDRE MORET, Sub-Director of the Musée Guimet, Professor of Egyptology in l'École des Hautes Études. Translated by Mme. Moret.

8vo, with 16 illustrations. Probable price, $2.00 net.

The first concern of the traveller in Egypt is to get some information about the ancient civilization—the political tenets, the diplomatic practices, the religious beliefs of the people that of old inhabited the land; where these people came from and when they came, what they brought with them and what they acquired; how they raised the time-defying pyramids and the colossal temples, and what prompted them to expend such Herculean efforts on these monuments; what literature they produced and what myths they handed down; what their ideas were of the present and of the hereafter. All this is set forth in Moret's volume, and much more that will prove invaluable to an appreciation of the country.

Charles II. and His Court

By A. C. A. BRETT, B.A. *With 16 Illustrations. 8vo, $3.50 net.*

Portrays vividly and in some detail the life of Charles II. and his Court, dwelling on the personal and social side of their life rather than on the political questions involved. A detailed account is given of the flight after the battle of Worcester. The final chapter discusses the mysteries of Charles's death and personality.

Schools of Painting

By MARY INNES. Edited, with a chapter on Schools of Painting in America, and certain further additional material, by CHARLES DE KAY.

8vo, 106 Illustrations. Probable price. $2.50 net.

This book offers a general view of the development of painting in Europe from the first century A. D. to the beginning of the nineteenth. It supplies an historical background to the art movements in various countries, so that the influence of one school upon another may be rightly judged. A brief biography is given of the prominent painters in each school, with a description of their most famous pictures and an appreciation of their work.

The Lowell Lectures, 1910

Republican Tradition in Europe

By HERBERT A. L. FISHER. *8vo, $2.00 net.*

Mr. Fisher describes the course of Republican ideas in Europe from the fall of the Roman Empire to the foundation of the Republic of Portugal. The mediæval theory of government, the Italian republics, the rise of the Dutch State, the English Commonwealth, the French Revolution and its effects, the republican movements in Germany, Italy, Spain, and Norway come under review. In the final chapter some explanation is offered of the decline of European Republicanism since 1848.

Behind the Screens in Japan

An English Woman's Impressions

By EVELYN ADAM. *$1.50 net.*

The book is no surface picture of Japanese life, but a penetrating study of the country and its people based on a long residence in the land of the cherry blossom. It pierces the thin coat of modernism with which the little brown people of the East have industriously overlaid their ancient customs, and gives an unvarnished account of the sub-surface aspects of Japanese life and character. Every page of the book vibrates with life and scarcely one but has a spice of humor.

Criminal Man

According to the Classification of Cesare Lombroso. Briefly summarized by his daughter, Gina Lombroso Ferrero. *Crown 8vo. Probable price, $1.50 net.*

Signora Guglielmo Ferrero's résumé of her father's work on criminal anthropology is specially dedicated to all those whose office it is to correct, reform, and punish the criminal, with a view to diminishing the injury caused to society by his anti-social acts; also to superintendents, teachers, and those engaged in rescuing orphans and children of vicious habits, as a guide in checking the development of evil germs and eliminating incorrigible subjects whose example is a source of corruption to others.

A REMARKABLE BOOK—JUST PUBLISHED

FROM MEMORY'S SHRINE

The Reminiscences of CARMEN SYLVA

H. M. QUEEN ELISABETH OF ROUMANIA

Translated from the German, by Her Majesty's desire, by her former Secretary, Edith Hopkirk.

In the preface to this remarkable book, Her Majesty expresses herself as follows:—"I am about to throw open the sanctuary I have so long jealously guarded from the world—the private chapel within whose niches my memories are enshrined. Those to whom I pay constant tribute of love and gratitude were either the idols of my early youth or the friends of riper years. I shall try to show them as they appeared to me on earth, in every varying aspect, according to season and circumstance, and to the changes of my own mood and habits of thought during the different stages of my mental development. To my youthful enthusiasm many of them became types of perfection, in whom I could discern no human weakness; to have known them was my pride and happiness. All that was best in myself I attribute to their influence."

With a Photogravure Frontispiece and Eight Full-page Illustrations. Demy 8vo. Cloth, gilt top, uncut, $2.50 net. Postpaid, $2.65.

THIRD EDITION NOW READY

JOHN BROWN: A BIOGRAPHY FIFTY YEARS AFTER

By OSWALD GARRISON VILLARD

Some Tributes to this Remarkable Historical Work

Philadelphia PUBLIC LEDGER. "A tremendous book; more thrilling than any book of fiction, powerful in its appeal, and which, while it is written soberly, as befits history, by the very nature of the narrative, often rises to the highest dramatic level."

THOMAS WENTWORTH HIGGINSON. "I can only say after reading from first to last its more than 700 pages that I have never encountered anything this side of Gibbon's 'Rome' which has made me feel more the personal power of a single work."

JOHN T. MORSE, Editor American Statesmen Series, in ATLANTIC MONTHLY. "Perhaps in thus dramatically fashioning his volume, Mr. Villard obeyed an instinct rather than acted upon a preconceived plan; that is often the case with great work, where a writer's feelings are deeply enlisted. Be this as it may, the merit and charm are none the less; he has seized well a splendid opportunity and has written one of the great biographies of our literature."

HORACE WHITE. "In my judgment a contribution to American literature to take rank with the very best historical writing of our time or any time. The only impartial history of the Kansas war."

ST. CLAIR McKELWAY in the Brooklyn EAGLE. "A biography replete with facts and marked by courage and candor, learning and justice."

Portland OREGONIAN. "The most valuable and comprehensive biography issued this season, and the best and most candid estimate of John Brown."

W. E. CONNELLEY in the Topeka CAPITAL. "The unprejudiced student and seeker for truth will herald the book as a great contribution to American history."

Des Moines CAPITAL. "More powerful in its appeal, more dramatic than any book of fiction, is this wonderful biography of John Brown."

The North Carolina REVIEW. "In this biography Mr. Villard has touched high-water mark. The book is a delight to the reader for many reasons. Full of life and movement, . . . written in an attractive and scholarly style, full of sympathy and yet without any loss in accurate presentation, it sets a new standard for biographical efforts."

Baltimore AMERICAN. "While the book has popular features in that it is entrancingly interesting, its scholarship is of the highest order and its style reminds one a little of Anthony Froude. . . . Mr. Villard has illustrated in this book the finest ideals of literary conception and execution."

London TIMES. "It is scarcely likely that any later writer will be able either to add anything of importance to Mr. Villard's collection of material or to better his interpretation of the whole story. . . . It at once becomes the standard, and probably the final authority on its theme."

Washington (D. C.) STAR. "Mr. Villard draws a compact, vivid, historic picture of the terrible focussing of this period upon our Civil War. Straight and clear in its literary way, this biography is a marvel of research and fair-mindedness."

HENRY WATTERSON in Louisville COURIER-JOURNAL. "No fault may justly be found with Mr. Villard's telling of the story. It is minute and lucid, altogether fair and unvarnished."

Burlington (Iowa) HAWKEYE. "It is a book which will take a place in the library of every well established home in this part of the country."

First Edition, October 1st; Second Edition, November 21st; Third Edition, March 1st

Fully illustrated with portraits and other illustrations. With copious notes and bibliography. $5.00 net. Postage 26 cents.

The Nation

NEW YORK, THURSDAY, MARCH 30, 1911.

The Week

Whatever comes in Mexico, the United States Government should be actuated by its own settled policy of friendliness towards its sister republics and by the law of nations, and not by the size of our capital invested. If the investment of a certain sum gives one nation the privilege of exercising unusual rights or powers, who is to say what that sum shall be? In what text-book is its size stated? Shall it be 50 millions, or 100, or 1,000? And does it vary according to the size of the country in which it is invested? A policy that would irretrievably disgrace this country would be one dictated by those who have entrusted their moneys to Mexican hands. We have but to recall to our readers the price England paid for her war in South Africa, undertaken in behalf of the South African mine-owners, to remind them at what fearful cost a nation permits its foreign policy to be shaped by those who have a financial interest. The very worst advisers in such a case are the men who have a money stake, for that blinds men more quickly than anything else to justice and humanity.

The fact that the Mexican situation appears to be improving does not make this any the less fitting time to emphasize these truths. The danger in our mind is that the people as a whole, and not a few magnates, will become imbued with the idea that large property holdings in Mexico give sanction to President Taft's action; that to the protection of those outlying Americans must be shaped our whole policy toward Mexico—that we may even set a date when the rebellion must cease. To do this would be to substitute for the law of nations the law of the jungle. Europe itself has recently afforded a useful example. When the monarchy of Portugal fell, anarchy reigned for a few days, and there were grave doubts as to the stability of the new republic. No one in the great and powerful adjacent republic of France, whose citizens are heavy investors in Portuguese government securities and commercial enterprises, then dreamed of menacing that country by rushing a French army corps to the border. Historic international policy was not to be affected in a moment because some French citizens might lose their all in Portugal.

Foolish as have been the rumors connecting the movement of troops to the Mexican border with the possibility of trouble with Japan, President Taft has done wisely in taking an early opportunity, upon his return to Washington, to set them at rest. It is stated that Baron Uchida, the Japanese Ambassador, in reply to the President's words of cordiality and friendship, assured Mr. Taft that he had attached no importance to the reports; and it may be added that nobody else had done so whose opinion is worth taking into account. The trouble about the spread of such rumors, however, is that, unsubstantial and absurd as they may be, they are apt to leave a vague residuum in the public mind, which is of no consequence at the time but may go far, on some future occasion when trouble seems actually brewing, to aggravate the situation. It is well, therefore, to put a quietus on the matter at the earliest possible moment.

It was fitting that Mr. Roosevelt in his address a week ago at the University of California on "the higher education," should have dwelt upon the higher law in international relations. This law is, of course, that when you see anything you want, you are to take it. "I took the Canal Zone," declared Mr. Roosevelt, "and let Congress debate." This way of doing it, he explained, was much better than the "traditional, conservative methods," by which it is plain that he meant the legal methods. For laying down this doctrine, Mr. Roosevelt deserves at least praise for frankness. He sets an example of telling the truth. When he says, "I took it," everybody knows that he is stating the exact fact, and that there is no need of looking further to fix the responsibility for the theft. And the ex-President is also to be especially commended for holding up his own precedent before young men in pursuit of a liberal education. Their great temptation is to entertain so many scruples about laws and treaties and national honor that their resolution becomes sicklied o'er, and they hesitate too long when there is a fine chance to steal foreign territory. As Mr. Roosevelt wrote to Sir Henry Johnston in 1908, "this people of ours simply does not understand how things are outside our own boundaries," and "the worst of it is that the educated Northeasterners are not merely blind, but often malevolently blind, to what goes on." At any rate, Mr. Roosevelt has now done his best to open the eyes of the malevolently blind to what was going on when he "took" the Canal Zone.

That the decision of the Court of Appeals, declaring unconstitutional the Workmen's Compensation act passed by the last Legislature, is discouraging to those impressed with the urgent need of the object in view, cannot be denied. It is particularly discouraging because the act was framed with the greatest care by an unusually able commission fully impressed with the necessity of avoiding as far as was possible in such a piece of legislation the danger of annulment on constitutional grounds. And finally, it must in one sense be pronounced most discouraging of all for the reason that our highest court unanimously declares the act to be in violation of a provision contained not only in the Constitution of this State but also in the Constitution of the United States. In some respects, however, the decision justifies a much more encouraging view. For the court, while declaring that the law, in making the employer in hazardous occupations liable to the employee even for injuries for which the former was in no way to blame, runs counter to the Constitutional prohibition against taking property without due process of law, shows in the strongest way a disposition to approve any measure for the like purpose against which this objection does not clearly lie. It points out that it is within the competency of the Legislature to abrogate, as this act does in effect, both the "fellow-servant" doctrine and the "contributory negligence" rule, in spite of the fact that these have heretofore been settled parts of the juris-

prudence of this State and country. "We entertain," says the court, "an earnest desire to present no purely technical or hypercritical obstacles to any plan for the beneficent reformation of a branch of our jurisprudence in which, it must be conceded, reform is a consummation devoutly to be wished." It may confidently be expected that the effect of this attitude of the Court of Appeals will be to cause the lower courts hereafter so to liberalize their position, so to diminish the rigidity of traditional rules, that the laws in their actual operation will be in effect essentially modified and reformed.

Renewed evidence, if any were needed, of the honor in which the memory of Grover Cleveland is held by his countrymen has been furnished in the prompt completion of the fund of $100,000, contributed chiefly in small sums, for the erection of a Cleveland memorial tower at Princeton University. The contributions came from all parts of the country, and the amount was completed on Cleveland's seventy-fourth birthday. Few things are more encouraging as to the future of our country than the fact that this strong and simple nature, this career of steady and unshowy patriotism, this record of quiet and persistent fidelity to principle without reference to the changing moods and fashions of the time, should have made upon the nation so deep and lasting an impression. From the beginning of his public career, when he buckled down to the task of cleaning up the city government of Buffalo, to the end of it, when as President he upheld the cause of honest money in the face of overwhelming hostility in his own and of contemptible vacillation in the opposite party, he was always the same single-minded and devoted public servant. What made this record the more notable was the fact that his attachment to his party was almost as strong as his attachment to his country. It was always perfectly clear that he valued the preservation of the party as much as did the noblest "regular" of them all, but that when a higher duty was manifest he could not hesitate as to which call was to be obeyed.

Two young New York physicians were killed within a week by meningitis. Their deaths in the line of duty may serve to remind us that the medical profession has had its martyrs. They come to the front in time of war and epidemic, but they are also called upon to pay their price in the ordinary daily practice. It is difficult to conceive a higher form of courage than is evinced by the men who have inoculated themselves with the germ of yellow fever and other dread diseases in order to serve science and humanity. The two victims of meningitis must have known the danger they ran in going about their work among the infected immigrants. And that points to a moral. The charge of wanton cruelty to animals will not hold against scientific investigators who, when the need comes, will not hesitate to stake their own lives. The world has come to hold that martyrdom is a good test of truth because it is an infallible test of sincerity. If medical investigators contented themselves with cutting up little dogs and never took chances in person, there would be better ground for the charge.

Readers of John Mitchell's address on "Industrial Accidents, and Compensation to Workmen for Losses Caused by Them" cannot fail to be impressed by its admirable tone as well as by its substance. The facts of the case speak for themselves, if only they are adequately brought home to the minds and hearts of the people; and Mr. Mitchell does not find it necessary to stir up passion by accusations of inhuman wickedness or preternatural greed against American employers and capitalists. Without entering into any question of the degree of moral culpability either on their part, or on that of the general public—which has certainly shown a lamentable degree of indifference on the subject—Mr. Mitchell urges that a large proportion of the vast suffering and loss annually caused by industrial accidents in this country is demonstrably preventable by entirely practicable measures. This is shown by such facts as that, while for each 10,000 men employed in European mines fourteen are killed annually, the number of such fatalities in this country is thirty-four for each 10,000. Both in the enforcement of preventive measures and in the reform of the laws relating to workmen's compensation for injuries incurred in their work, we are unquestionably, as Mr. Mitchell says, disgracefully behind the great industrial nations of Europe, and this is a condition that cries out for remedy. We can think of no more efficient agency for speeding the improvement than just such sane, and at the same time emphatic, advocacy on the part of the real labor leaders as is exemplified by Mr. Mitchell in this address.

The charge made against Booker Washington the other day was in every particular so wildly improbable that we are quite sure that there has been, among right-minded persons, not one in ten thousand who did not instantly reject it as false. Even if his past life had been merely one of ordinary respectability, the flimsy basis on which he was accused of having done a thing at once so queer and unusual, so wholly without rational motive of any kind, would put the matter beyond the need of discussion. This would be so even if we were to give Mr. Washington the benefit merely of that degree of consideration which is due to any person who has enjoyed an unblemished reputation throughout a long and active life. When, however, the case is that of a man who has done a great work, bringing him into continual contact with hundreds of persons in every station of life, and who has extorted, by sheer force of character and ability, the esteem and admiration of the white South in the face of every possible prejudice, the idea of permitting any shadow of doubt to cloud his name in consequence of a silly tale like that of the Ulrichs is one that can only arouse indignation. That their tale is the result of some stupid blunder on their part is highly probable; but from the details concerning Ulrich that have come out in the press since the assault occurred, it appears that the source of the story is even lower than might have been inferred from the story itself.

It is easy to sympathize with Mr. Roosevelt in his feeling about the necessity of the recall as a remedy for conditions which have been shown to exist in the California judiciary; but it is easy also to sympathize with those who resort to lynching as a cure for similar evils. The question that a man has to ask himself, if he has a proper sense of the highest responsibilities of citizenship, is whether the attainment of the immediate end will compensate

for the violation of a principle of permanent and fundamental importance. The real argument against the lynching of a corrupt boss, for example, is not only that it is lawless—there are times of desperate need when it may be that even lawlessness is justifiable—but that if a people is incapable of saving itself from misgovernment by the vote it will not long be saved from it by the killing of some victim of its wrath. And so in the matter of the recall of the judiciary. It is of the very essence of the judge's functions that he pass judgment without fear as well as without favor; and the only way to get good judges is to elect or appoint men who can be trusted. If a people has failed to establish such standards in the judiciary, the task must be undertaken, however slow and laborious it may be, of toning up public sentiment and public intelligence to the point at which these standards will be insisted on. The short cut of the recall may temporarily accomplish the result much more rapidly—just as lynching might; but it would be a success achieved at the cost of such sacrifice of judicial independence as might in the future bring evils incomparably more difficult to eradicate than those it was hastily adopted to remove.

"Talking down" to the people has received another discouraging response in the preference at the Sunday afternoon concerts in Milwaukee for classical music, only 11 per cent. of the requests being for a "rag-time" programme. The fallacy in the argument of those who undertake to please the public taste, whether in amusement, literature, or politics, lies in their supplying great quantities of the mediocre or worse, and then pointing to the consumption of it as evidence that it is what the consumers want. As well argue that people prefer adulterations of medicines and foods, because they buy them. Human readiness to accept what is offered is unfortunately prompt, but it is no more an indication of what is desired than the resort to a bank, because it happens to be around the corner, is an indication of a desire to be cheated. People are to blame for not taking more trouble to "insist on the brand," as the advertisements put it, but this is no reason for confusing their indolence with unwholesome longing, and then encouraging the latter by pandering to it.

The relations between the Italian Government and the Vatican at the beginning of the national jubilee will not be improved by the inclusion of a strong Socialist element in the newly constituted Giolitti Ministry. We need not accept seriously the rumor that Papal disapproval of the celebration is to take the form of closing the treasures of the Vatican to the public. The issues at stake are not to be fought out in so childish a fashion, especially if the new Cabinet, as is probable, should be driven to initiate an anti-clerical campaign. Thus far the astute Signor Giolitti has refused to be drawn into war against the Church. But it may be that he recognizes the favorable moment to be at hand. If, in the midst of general rejoicing over united Italy's first half-century, the Vatican should hold itself apart, it would require no particularly skilful politician to stir popular discontent with the Curia to intenser activity. To a certain extent, therefore, Signor Giolitti, in giving his Cabinet a strong Socialist tinge, has formulated a threat. Upon the fashion in which the Vatican receives it may depend the beginning of a new era in the relations between the Curia and the Government.

That the relations between the Vatican and Germany are somewhat disturbed was made evident by the Chancellor's recent speech on the subject before the Prussian Diet. Von Bethmann-Hollweg did, indeed, use a conciliatory tone and expressed the hope that all the matters at issue might soon be adjusted; but at the same time he let it be known that the Government did not propose to surrender its right to fix the conditions under which professors should serve in the universities. The demand by the Curia that all Catholic teachers in Germany should take the oath against modernism, the Chancellor declared to be one which, if persisted in, might lead the Government to consider the advisability of dissolving the Catholic faculties in the universities and suspending teachers in the gymnasia. He hoped that such a course would not be necessary, and a letter of Cardinal Merry del Val to Cardinal Kopp of Breslau put a better face on the matter. But what the Chancellor asserted to be absolutely essential was entire frankness and directness by the Holy See in all its diplomatic negotiations with Germany. Von Bethmann-Hollweg referred particularly to a statement in the *Osservatore Romano* (the official Vatican organ) denying that the concessions made by Merry del Val were the result of diplomatic representations. That was not to give the whole truth, affirmed the Chancellor, and such publications would not help to restore good relations. But three days later it was explained at Rome that the *Osservatore* was not correctly understood, and that the Vatican was strongly desirous of coming to a good understanding with Germany. To attain that end, however, it is clear that there will have to be a modification of the announced Vatican policy.

For a parallel to the dramatic fall and rise of Premier Stolypin we must go back to the history of France under the Pompadours and Dubarrys as recorded in the novels of Alexander Dumas the elder. Under Nicholas II as under Louis XV, ministers are made, unmade, and remade within twenty-four hours by a system which it would be a farce to call government, composed as it is of equal portions of despotism, intrigue, and sheer incompetency. The parallel with the *ancien régime* is completed by the floods of champagne in which Stolypin's fall was prematurely celebrated. The few facts that stand out of a muddled situation are these: Constitutionalism in Russia is to-day only a hope, and a faint hope at that. No legislative measure can become law without the consent of the Duma and the Council of Empire, but if such consent is refused, it does not really matter. The Emperor can legislate by decree only while the Duma is not in session; but if the Duma happens to be in session it can be prorogued from Monday to Thursday and the required decree published. Stolypin's grip on the Emperor consists in Nicholas II's recognition of the fact that it must be either Stolypin or a truly Liberal Ministry, which the Imperial Will regards with abhorrence, or a return to the old grand-ducal plunderers and incompetents, which Imperial prudence shrinks from. So the man who crushed out the Revolution and tamed the Duma is to go on alternately bullying and cajoling the people's representatives, stifling the universities, persecuting the Jews, and ruling Constitutional Russia according to his own sweet will.

PEACE AGREEMENTS.

"International lawyers have done a great deal of mischief by taking upon themselves to interfere with the strategy and tactics of our naval campaigns." This seems a strange deliverance to come from one bearing the name of Ellenborough. It is, however, a sentence from the speech made in the House of Lords not long since by Lord Ellenborough—of the lineage of the great jurist. He was attacking the Declaration of London, with a violence befitting a retired naval officer. This highly important project, drafted by the representatives of all the great Powers in a conference summoned by Great Britain herself, and designed to strengthen the position of neutrals in case of war and to extend the immunity from capture of private property at sea, seemed to the noble lord perfectly intolerable. To him it was "a one-sided treaty which favored Continental countries but was unsuited to an island Power such as we." Anyhow, the whole thing would be thrown into the waste-basket if there should be a war, since British naval officers could be depended upon, happily, to cut through "dubious wording" with the sword.

Such an outbreak would not be worth referring to were it not typical of a great deal of talk that has been heard in England lately. Endless newspaper and review articles have been published and books written against the ratification of the Declaration of London. Their general argument comes down to this, that Great Britain is entitled to do whatever she pleases in naval wars, and should never assent to anything that would interfere with her treating neutral ships and private property at sea according to her taste and fancy at the moment. Fortunately, powerful voices on the other side have not been wanting. Professor Westlake of Cambridge, in his capacity as Lord Ellenborough's hated international lawyer, has printed a series of articles in defence of the Declaration; while Mr. Asquith and Sir Edward Grey, for the Government, have stoutly advocated it, though agreeing to postpone ratification until after the Imperial Conference in May. In the very session of the House of Lords alluded to, the Lord Chancellor made a weighty speech, setting forth the legal aspects of the matter with a kind of sledge-hammer authority, and dwelling especially upon the bad name that England would get if she held aloof from a humane consensus of the other great naval Powers. Said the Lord Chancellor in conclusion:

> I would ask your lordships to bear in mind that we are not the only nation in the world. We are not the only maritime or commercial nation in the world. If we wish, as some writers apparently desire that we should, to stand by our own law even to the last jot and tittle, if we are to refuse such concessions in return for the advantages which I have endeavored to place before your lordships, if we are to do that after we have ourselves been the people to invite the consideration of other nations nearly five years ago, it would be treated as a defiance of the opinion of the world.

This particular English debate is instructive as an example of the play of opposing motives which enters into every attempt by international agreement to minimize the brutalities of war and to make peace more secure. Some public men will always take the attitude of Lord Ellenborough. They will sneer at the milk-and-water pacifists, fall back on what they call the unchangeable facts of human nature, and listen to nothing except the argument of pike and gun and the rule of tooth and claw. Particularly will they declaim against treaties to keep the peace or to establish neutralization—treaties, they assert, which no nation will observe if it finds its interest is to violate them. Even President Taft fell into that vein when he said that no dependence could be placed upon an international treaty guaranteeing the neutralization of the Panama Canal.

But along with this position of international distrust and real disbelief in the power of moral forces and the good faith of nations, there is a slowly-gathering body of opinion in all civilized countries which is pressing with greater strength and success for peace agreements among the nations. We see how the idea spreads by the way in which President Taft's stand for a comprehensive treaty of arbitration with England has so deeply impressed the imagination and kindled the hopes of Europe. Other lands than Great Britain are beginning to ask why they, too, should not be included within the circle of peace. The French Ambassador at Washington has already made approaches to President Taft for the purpose of seeing whether a like treaty with France may not be negotiated. We may be very sure that Germany, under her new Chancellor, would not be slow in responding to any advances along similar lines that might be made to her by our Government. It is more than fifty years ago that Lord John Russell wrote of one of his dispatches to Paris: "I hope you will not think there is too much of the Gospel in it for a Foreign Secretary." Such a half-apologetic tone no man charged with the conduct of international relations would think of using to-day; and that fact alone is significant of the progress that has been made and of the swifter progress yet to come.

PROGRESS IN ITALY.

It is not altogether inappropriate that the dramatic trial of the Camorrists at Viterbo should begin just when Italy is making ready to celebrate the semi-centennial of her political unity. The fifty years that have passed represent to the Italian people something more than an evolution from dismemberment to union. The advance has also been from economic destitution toward a high degree of economic prosperity, and from social disorder to an increasingly emphatic reaffirmation of the reign of law. Disunion, poverty, and social anarchy were Italy's inheritance from her unhappy past. The Mafia and, to a lesser degree, the Camorra were not, in their origin, mere criminal organizations. Both are directly traceable to the times of Spanish rule in Southern Italy, when the people, plundered and oppressed by their foreign masters, resorted to secret societies for the working out of some rude form of justice. To-day they are an ugly survival. The new Italy that has been relaying the foundations of its economic prosperity, rebuilding its cities, and reasserting itself in the councils of the European nations, has now set out to eliminate the forces of domestic disorder. That the Camorra will be crushed at one blow is improbable. The significant thing is that the campaign, begun a half-dozen years ago, is being carried out with determination.

A succinct account of economic progress in Italy during the last thirty years is presented in the last number of the *Century Magazine* by Ernesto Nathan, Mayor of Rome, and one of the most prominent exponents of the modern progressive movement in the Italian peninsula. Signor Nathan begins

with a necessary caution. Economic progress in Italy cannot be measured by American standards. As opposed to America's vast natural resources,

> We [the Italians] are a nation with a long and lean peninsula, the whole of which, even to the limits of eternal snows—plain and mountain, water and land—is totally appropriated and divided up; the birthright of which dates back some twenty centuries; which possesses no coal, indeed, no fuel beyond its meagre forests, no source of energy beyond its streams and rivers, with all its natural resources long ago sucked dry.

This is a condition of things that applies with varying force to all of Western Europe; it applies with most force in Italy. Yet in Italy the population has grown since 1882 from twenty-eight to thirty-five millions. The budget deficit has been wiped out, in spite of the fact that the annual appropriations have risen from 1,270 million lire to over 2,000 million. Government securities to-day stand high.

Signor Nathan tells how this has been brought about:

> Our people have worked hard, lived rather closely, and saved money; they have bought back nearly all our stocks that were in foreign hands (something like a billion dollars' worth), besides putting aside other savings; capital has increased; post office savings banks, which, in 1882, had deposits of 59 million lire, now hold over 1,600 millions; the 740 millions in the private savings banks are now 2,460 millions; the deposits in banks of various kinds have swollen from 858 millions to 2,372. These seem small amounts to countries that calculate in billions of dollars, but they are satisfactory for poor people, and they are trustworthy, being culled from the statement made to Parliament last December by our Minister of the Treasury, Signor Tedesco.

Italian engineering skill ranks with the highest in Europe. The consumption of coal in Italian industry has risen in thirty years from two and a half million tons to nine million tons, besides half a million horsepower of water. The country has not escaped the usual evils attendant upon a rapid industrial development. There are urban overcrowding and want. Yet taking the population as a whole, the standard of living has perceptibly risen. The people, asserts Signor Nathan, eat more than they used to, absolutely and qualitatively; they eat more bread, drink more wine, and consume more animal foods, and suffer less from malaria and pellagra. Mayor Nathan does not touch on one obvious source of Italian prosperity—her vast emigration and the resultant annual inflow of wealth from abroad.

There are phases of modern Italian progress that are not viewed with unmixed approval, especially by the foreigner to whom Italy is—Italy. The city-builder has laid his desecrating hand on the monuments of a glorious past, and hews down Renaissance palaces in the name of a new gospel that is called sanitation. But upon the great mass of the Italian nation, proud though it is of its past, the present enforces its problems; and the future, too, beckons. Signor Nathan is a leader among the Vandals, or progressives, as we choose to call them. He thinks in terms of sewage and apartment-house blocks. He has declared with much vehemence that Italy is no longer content to keep herself a graveyard and an archæological museum for the nations. Utilitarianism has found curious literary expression through the mouth of the Futurists, a rather extravagant poetical band, whose leader recently told the Venetians that half of them are paupers, and dirty paupers at that, and called upon them to fill up their insalubrious canals and pitch their useless new Campanile into the sea. Like many other extravagances, this one of the Futurists is only the wild exaggeration of a sound and popular idea.

THE BIBLE TERCENTENARY.

Elaborate plans are making both in this country and in England to commemorate the three-hundredth year since the publication of the King James English Bible. Time would fail us if we were to attempt to enumerate the many reasons why this event deserves celebration, and we limit ourselves to one: the fact that the translation of the Bible made in 1611 is a great literary monument of the English language. Wholly apart from what the English Bible has been in the faith and hopes and prayers of nine generations, its weaving into the writing and speech and thought of millions of human beings has made it unique and venerable. This very fact, however, may raise a doubt in some minds. Are we confounding effect with cause? Is there not a danger lest the immense impression of long inherited associations, precious and solemn, be transferred to the Bible as pure literature, and we incline to praise too highly as English style what we have first surrounded with holy awe? Many a man, we fancy, has turned back to the Bible in later years with something of the anxiety with which he revisits what he felt in his youth to be grand and inspiring natural scenery. Will his mature judgment confirm young enthusiasms?

Needless to say, any such apprehension is speedily dissipated in the case of the English of the King James's Bible. Its praise has been often in the mouth of competent and impartial judges. The great cloud of witnesses to it includes not merely preachers and devout women not a few, but poets and orators and critics and statesmen. What forced the ice-cold judgment of Hallam into a glow, what the literature-devouring mind of Macaulay exalted as supreme, lesser mortals need not be afraid to admire. Ruskin's crowning of the English Bible is well known; Huxley's tribute less so, though even more convincing. It is a Catholic who said that the language of the Authorized Version "lives on the ear like music that can never be forgotten." And so fastidious a critic as Professor Saintsbury has singled out a passage from the Old Testament as the best example known to him of "absolutely perfect English prose." It is the following from the Song of Solomon:

> Set me as a seal upon thine heart, as a seal upon thine arm; for love is strong as death; jealousy is cruel as the grave: the coals thereof are coals of fire, which hath a most vehement flame. Many waters cannot quench love, neither can the floods drown it: if a man would give all the substance of his house for love, it would utterly be contemned.

Scholars and historians have often dwelt upon the fortunate conjunction of circumstances by which the English Bible came into being just when it did. It was a time when the language lent itself with ease to such strength and majesty as are fixed for all time in the King James version. Our present mind, however, is not to go over this beaten path again, but to refer once more to the great loss which the disappearance of the old familiarity with the very phraseology of the Bible has brought with it. The loss is, first of all, as of a key to a great deal of the best in English literature. The Bible is not only a masterpiece itself, it is inwrought in many other masterpieces. Biblical allusions and terms of speech sprinkle the pages of Shakespeare, are as thick in Milton as his own leaves of Vallombrosa,

and color the phrase and thought of Tennyson. We remember to have seen a college examination paper on the latter poet, wherein explanation was asked of Bible incidents and names and idioms adding beauty and significance to his verse. It is unnecessary to say that most of the students miserably failed to pass. What to boys and girls of fifty years ago would have been second nature, is to an appalling number of even well-educated young people today an alien world.

Is there any way of making it as widely familiar again as it once was? This is a question often asked, not merely by religious teachers, but by those interested in the best secular education. They know how maimed and half made-up a student of English literature must be unless the lingering charm of Scriptural terms of expression clings to his memory and he has an easy acquaintance with Bible narrative, yet how to prevent the old knowledge from vanishing away is the problem. Modern attempts to solve it have not been highly successful. Formal schemes of Bible study in college or in special literary courses do not seem to meet the case. Students go out from such classes still dull to the sinewy phrases and the haunting words which a former generation instantly identified with Bible diction. And the great reason for it, we think, the almost insuperable difficulty, is that a late and literary study of the Bible can never make it the instinctive possession, the man of our counsel, that it was under the old system of assimilating its contents. Assiduous reading in the family from earliest days, the memorizing of Psalm and parable and prophecy and beatitude, the listening to the rolling echoes of Sinai in church on Sundays, along with the lightnings and smoke of torment in the Apocalypse —all this was a process to stamp upon the mind indelibly what no amount of sophisticated study can yield. Grant that there was a certain fear in the childish heart as the sacred page was confronted; it was yet a way of sensitizing the photographic plate to make it receive and hold the impression. All this has largely gone, we fear, and with it the intimate knowledge and the swift response which a speaker like Webster or even Garfield could count upon in his audience when he played upon some chord that thrills in the Bible. To have lost so much of this as our generation confessedly has is little short of an intellectual calamity, and it is to be hoped that the Tercentenary will aid in recovering something of what has slipped from us in knowledge of a book that has for three centuries been "woven into the life of all that is best and noblest in English history."

THE EXCHANGE OF PROFESSORS.

We are glad to note that in the sober press there is genuine disgust at the mortifying behavior of the two American professors who have been in Berlin this winter, and at their and their wives' squabbles in the matter of going to court. Every one must, indeed, have felt astonishment that representatives of American culture and learning could thus write themselves down as on a par with vulgar *nouveaux riches*, wanting manners and good taste. But, unfortunately, the matter cannot be allowed to rest there, for the whole scheme of exchanging professors has been endangered by just this sort of thing. That is, it has been all but warped from its original purposes by the influence of the Berlin court and the readiness of many of the representatives of this country to bow down before royalty as if there were no such things as republican dignity, scholarly modesty of bearing, and indifference to the glory of royal attentions. The example of Franklin has too often been forgotten; we have heard too much from returning professors of the graciousness of this or that prince or of the number of times the Kaiser invited them to lunch.

Naturally, these things do not go unnoticed in Berlin. The social climber (*Streber* the Germans call him) is not so unknown a specimen in that capital as to make it impossible to classify a foreign variety. A recent French book on Berlin contains an interview of the author with the Kaiser's Court Chamberlain in which, in a way humiliating to all Americans, that official bewails the presence in Berlin in increasing numbers of rich and well-gowned American women who go on their knees to royalty and on all occasions betray their total lack of breeding and good manners. Now, the noise and glare of people of this type obscure those of culture and refinement who sojourn in Berlin to profit by its advantages. With the professors, too, the admirable bearing of such scholars as Prof. William M. Davis and Prof. Theodore W. Richards of Harvard, who devoted themselves to their tasks of the classroom and forgot all about there being a court, or of a democrat of the type of Felix Adler is too readily forgotten when a successor gives a lavish dinner to a hundred or more persons at which he himself, his wife, and children are toasted and extolled. And the true representative of culture is also forgotten when it comes to battles of the *Schleppencour* and the mad race to see who shall converse oftenest with the Crown Prince.

Now to some it might seem as if the solution of all this difficulty were merely greater care in the selection of the exchange of professors; that President Butler and the Harvard authorities should not only always select gentlemen, but gentlemen who will put an end to the jealousies between the Roosevelt and Harvard professors, out of which have arisen many of the untoward incidents for which both universities must blush. There is more to it than that. There ought to be a clarifying of our conception of the duties of these professors in the light of the experience gained. There ought to be a decision once for all as to whether these professors are ambassadors to the court, or to the *Gelehrtenwelt*, or genuine interpreters of the ideals, aims, and aspirations of one people to another. One of the most distinguished of German publicists welcomed with joy the news of the appointment of Felix Adler, because, he said, here is a great teacher who will not think that his mission has ended when he leaves the classroom or the court-levee, but will carry his message of good will to the people as well. But there are not many Felix Adlers, and some great teachers like Professor Richards can only give their message in the chemical laboratory; other real scholars often find themselves confined to their academic audiences.

None the less, there ought to be a readjustment of the point of view and a limiting of the choice to one of the two types, the publicist or the scholar. The Roosevelt professorship is not restricted to university teachers; it can be filled by public men or devotees of literature. Hence it is not true that the list of available candidates has been exhausted as some allege; there is as

great a range of choice as there are able men capable of lecturing abroad. But the real need is of men who can place before the German people the ideals and the ethical standards of the people, who can lay bare the nation's heart, and explain abroad those common denominators which at bottom make our democracy great. For the establishment of these professorships was primarily a peace measure; they were to be the unofficial ambassadors who, free from the trammels of diplomacy, could smooth out misunderstandings and help to remove that ignorance of one another which is the real source of most international misunderstandings. As far back as 1907 able and outspoken Berlin newspapers were frank to say that the interchange had merely been a *succès d'estime;* that whether it was due to the court-stamp on the undertaking or not, the prospect was then that "no result worth mentioning, no real moral or scientific gain, will result." The Berlin *Tageblatt* was even then fearful lest the whole experiment only "turn out to be a curiosity in the history of education." Has there been anything since then to warrant a different view?

Surely the time has come for those responsible to revise their plans, all the more so because the German exchanges have been at times far from ideal. Is the fault, as the *Tageblatt* suggests, because the emphasis is not upon the different methods of teaching here and abroad? Or does it lie deeper? Even if it should prove on examination to have been an impossible experiment based on impossible ideals, the truth should be known. But one thing at least Harvard and Columbia can now do for the country. By eliminating the court feature and forbidding professors to seek royal favors for themselves and their wives they can at least save us from national humiliation, even if they cannot assure us of the achievement of permanent good.

APPLIED LITERATURE.

A recent tale outdoes Jules Verne by presenting, partly in dialogue, partly in incident, the results of the astronomical observations and calculations respecting the mysteries of Mars. The book is, in form, a story, and in fact it possesses all the necessary framework and accessories of one. In its pages live characters as real as those in a pure romance. They plan and achieve, love and suffer, as naturally as if they had nothing to do with such task-work as instructing the followers of their fortunes in the results of a branch of scientific research. Indeed, the unscientific reader will not find it difficult or even especially distracting to turn the leaves more rapidly in some places than in others, and so defeat the author's announced purpose of improving his mind, while discovering more speedily the ultimate fate of the beings in whom he is concerned. Such a book has an obvious two-fold interest, and yet, with the characteristic defiance of art for mathematics, its appeal is less effective than that of unmixed fiction. Sooner or later the reader becomes impatient with its merely romantic parts, or more likely skips the informative interruptions to the course of the narrative. The result in either case cannot be satisfactory to the painstaking writer, who finds himself unflatteringly looked upon as an unskilful story-teller or a frivolous savant.

Yet he is in a large and not ignoble company, for, if it includes such modern figures as George Eliot, with her "Felix Holt"; Dickens, with "Bleak House" and "Nicholas Nickleby"; Mrs. Browning, Tennyson, Zola, Ibsen, and Tolstoy; it comprises also Homer, with his catalogue of ships; Aristophanes, Virgil, Cervantes, Chaucer, and Bunyan. Of lesser examples, such as "Uncle Tom's Cabin," "Looking Backward," "Robert Elsmere," "Jude the Obscure," "Ben Hur," and "Justice," the lists are equally full. Indeed, a casual survey seems to disclose as great a disproportion between the amount of what we may distinguish as pure and as applied literature, as there is between pure and applied mathematics, or science. This probability grows toward certainty as one reflects upon the volume, not only of pseudo-scientific and historic tales, and of problem novels and plays, but of those serving as vehicles for social and economic theories, or of mystery. And while the novel is ordinarily fastened upon as the medium for such pedestrian effects, poetry is not beyond impressment for the same purpose. Not to speak of the mass of personal, political, and didactic verse, often satirical, frequently little better than doggerel, of moderate length, ranging from Addison's "Campaign" and Dryden's "Mac Flecknoe" to Gray's "Progress of Poesy" and Tennyson's "Palace of Art," there are the more extended ambulations of Lucretius, of Horace's "Ars Poetica," Pope's "Essay on Criticism," and Wordsworth's "Recluse," if one is not compelled to look a little askance at even "Paradise Lost."

It is Milton, however, that brings one face to face with the difficulty of drawing the line between pure and applied literature. If ever there was a poem with a purpose, it was the one composed to assert eternal providence and justify the ways of God to men. Johnson's "Irene," on the other hand, can hardly have had any except a literary end. Yet it is not the ostensibly literary, but the avowedly didactic, production that we admire, and for its majestic beauty. Spenser wrote his great work for the "generall end" of fashioning "a gentleman or noble person in vertuous and gentle discipline," but it is not that which has sent every generation of poets since to the "Faerie Queene." The difficulty is not lightened when we turn to such practical, affairs-of-the-hour productions as the "Philippics" of Demosthenes, the more familiar of Cicero's orations, or the inaugurals of Lincoln. If these are not pure literature, one is tempted to exclaim, so much the worse for pure literature. What a lot of well-meant attempts in that direction they have survived! It all recalls the assertion that Burke should have written poetry, and Dryden and Pope prose.

Is the distinction that is recognized in mathematics, then, between pure and applied, non-transferable to literature, or rather, not worth transferring? Does the paradox of pure literature which is inferior, even as literature, to that in which the literary element is only incidental invalidate such classification? Or are our instincts right in leading us to think more highly, as a rule, of those pages that are penned for nothing less direct than the winning of our appreciation for their charm of plot, characters, and style? Even of them, however, it would not be safe to assert the absence of all non-literary motive. We can hardly imagine an author solemnly setting himself down to the work of turning out masterpieces—and succeeding. And as a matter of fact, most of them were not done in any such way. Sophocles was ambitious, primarily, to win the tragic prize from his brilliant

rivals, Æschylus and Euripides. Shakespeare wrote, not for all time, but for a theatrical season, or, if luck favored him, for two seasons. Goldsmith was driven to immortality by publishers who had a mortgage on his genius, and such smaller stars as Herrick, Gay, and Lovelace composed their lines for the sake of giving pleasure to their friends. Milton, indeed, hoped to leave something that the world would not willingly let die. Doubtless, many of the great, before and after him, bemoaned their inability to write with an eye single to the demands of literary art. They did not realize that pure literature, like fame or influence or character, is mostly a by-product, and that what they craved, therefore, was as unnecessary as it was impossible.

PARIS BOOK NOTES.

LITERATURE AND CRITICISM.

PARIS, March 18.

"George Meredith" (A. Colin: 300 pages, 3.50 francs), by Constantin Photiadès, is intended to satisfy the curiosity of French readers concerning the life, imagination, art, and teaching of a man whom, "for more than fifty years, an international group of the initiated has been extolling as one of the greatest writers of modern England." The book, with its French clarity (the author is a Parisian, if not a Frenchman), may serve an equal purpose to many uninitiated English and American readers. The author's opening visit to Flint Cottage in 1908 is an illuminating personal record like Eckerman's for Goethe. The life of Meredith is explained simply in its connection with his literature. His imagination is analyzed chiefly from his "Harry Richmond," with copious translations. His art, in its lyric qualities and style, with its analysis and concentrated effects and super-acute notes, is studied in his poems as well as in his varied prose works. His teaching or logic and philosophy of life—his Notion of the Earth, his Notion of the Comic Spirit, which from Jupiter or Uranus might judge all our feelings and acts with relation to our environment in our own planet—is compared with what critics of friendliest insight have said of him. "In all countries, most of all in France, there are people predisposed by character and culture to like Meredith."

"De l'Art, de l'élégance, de la charité" (Fontemoing: 270 pages, 3.50 francs), by André de Fouquières, is the work of an *arbiter elegantiarum* in the cosmopolitan *salons* of Paris. He has so long been before the footlights of fashion that what he has to say will interest many. Something ought to be learned from this renaissance of "dandysme" and from charity where "social service" is not yet the accepted formula, but each *grande dame* must have her particular *œuvre*—maternal adoption of Juggling Jerry's children or the protection of young girls and the Red Cross.

"Charles Ritter—1859-1905" (Paris: Fischbacher; 310 pages, 3.50 francs) is a choice of letters to and from an able, pensive, cultivated Swiss professor, with "friends and masters" like Sainte-Beuve, Renan, Taine, Cherbuliez, Paul Bourget, the counter-theologian Strauss, George Eliot, Edouard Schuré, William James. The last confided to the Swiss friend of his youth that he was fully decided to try the painter's trade; it was when James was eighteen. At fifty, he writes that his big book of philosophy is making money for him. In these letters are many sincere utterances on latter-day questions, such as are given out among friends.

"Correspondance de Renouvier et Secrétan" (A. Colin: 168 pages, 8vo, 2 portrait plates, 3.50 francs) will be chiefly interesting to those who follow the movement of philosophic thought. Even now, perhaps, only one book and an evanescent influence are all that remains from Secrétan; but Renouvier has left the most continuous and consistent mass of criticism of the world's thought through the ages which was published in the nineteenth century. His positive contribution is not so great, at least not as it is found in his own works, although his thought shows through every page of Bergson and Pragmatism. From his first publications in 1836, when he was fresh from the lessons of Auguste Comte on the philosophy of mathematics at the Ecole Polytechnique, until the last days preceding his death in September, 1903, Renouvier's life was given over to the one absorbing study of philosophy. Unlike Herbert Spencer, he attended first to the critical study of what others had thought, and then to the elaboration of his own system. Having a system of his own was needed to give controversial incitement to his criticism; and this is the chief merit of his letters to his friend of many years, Secrétan. From 1868 to 1891 these thinkers, both systematic, disagreeing gravely, held communion of thought. The persistent opposition of Secrétan, who never succumbed to the more powerful thought of Renouvier, helps to clarify many points of the latter's philosophy. Secrétan, in his lumbering Swiss French, brings out his points clearly. Renouvier, with his life-long dislike of the Church, from the necessity of his thought strove after more and more precision in what came to be almost the historic scholastic vocabulary and principle, bringing his criticism into the great body of classic philosophy. His positive system, which he elaborated with as complicated safeguards of language as Bentham, comes out as clearly as may be in these letters, which, moreover, are anything but scholastic. They will have their use as a *manuductio* in the erudition of philosophy. "I have read several of your volumes and you have read some of my poor volumes, and we continue—what? we begin debating all sorts of high questions between ourselves, struggling against the double difficulty of understanding and speaking."

"Histoire de la poésie française au xvie siècle" (H. Champion: 390 pages 8vo), par Henry Guy, professor in the University of Toulouse, takes us into the literary heart of the Renaissance. This first volume deals with the school of *rhétoriqueurs*. It is the beginning of a work of considerable magnitude, not engaged in the bibliography or philology or æsthetic criticism of French poetry, but investigating scientifically how poetry arose in France, the influences which inspired the poets, and the origins of their art. The book begins with the general characters of the period: the sources in other literatures, such as the Bible, Greek, and Roman and mediæval authors; the art centres, material situation of those who cultivated the art and those who served in place of Mæcenas; the material of the poetry and its chief ornaments; its complications and plays of rhythm; and the poetic *genres*. The second part takes up in order the *rhétoriqueurs* from Octovien de Saint-Gelays, born in 1468, to the court poets and Jean Parmentier, completing the first third of the century. Each chapter is followed by its bibliography, and there is a complete index of names—but, alas! no table of contents. With all its scientific merit, the book is very readable for the student of French literature.

"Souvenirs d'un enfant de Paris" (Fasquelle: 430 pages, 3.50 francs), by Emile Bergerat, is far from scientific literature; but it is the stuff from which such studies of nineteenth-century French literature will have to be made by the university professor of the future. The book tells entertainingly the "years of Bohemia" of the author, a son-in-law of Théophile Gautier. Through his pages walk familiarly Victor Hugo and belated Romantics, beginners like Sarcey and Daudet, amid very lively personal remembrances of the author as a schoolboy at war with his Latin; in the real war of 1870; and then a long section of history and stories of the later years and company of Théophile Gautier himself. The transition of Young France to what has turned out to be a new era as well as a new régime is plain to be seen. Perhaps Emile Bergerat is not even now quite alive to the fact that he, too, in his turn, is an ancestor; but this, like wine long-bottled, only adds to the sparkle of his anecdotes.

S. D.

NEWS FOR BIBLIOPHILES.

The first selection from the great library of the late Robert Hoe will be sold by the Anderson Auction Company in nineteen sessions, beginning April 24, and continuing to May 5. The catalogue of this first part is issued in two volumes containing 3,538 lots.

The vellum copy of the Gutenberg Bible is included in this part. This, the first book printed with movable types, was very fittingly the glory of the library of Mr. Hoe, the man who did more than any one else of his generation to advance the art of printing.

This copy, printed upon vellum, has an authentic history going back to 1825, when it was bought at auction by J. and A. Arch, booksellers, for Henry Perkins, a brewer, and one of the greatest book collectors of his day, for £504. Perkins died in April, 1855, his library going to Algernon Perkins, who died in 1870. In 1873 the library was sold at auction, bringing £26,000 for 865 lots, the vellum Gutenberg Bible bringing £3,400. It was bought by F. S. Ellis for the Earl of Ashburnham, and when again sold with his books in June, 1897, Quaritch paid £2,000 for it. It probably cost Mr. Hoe about $22,000.

Of the seven known copies on vellum of this all-important book this is not only the only copy which has ever been sold at auction in England but is the only one which any collector can ever hope to stand even the remotest chance of procuring, all the other known copies (excepting Mr. Morgan's) being in public libraries from which they can never pass.

Of the seven known copies on vellum two are owned in New York, one in England (the Grenville copy in the British Museum), one in France (in the Bibliothèque Nationale), and three in Germany (one in the Royal Library at Berlin, and two in Leipzig). It would be a notable thing for some wealthy American to seize the opportunity to buy this copy and, at his death, to present it to the Library of Congress.

Only one copy of the book has heretofore appeared in American auction rooms. At the Brinley sale, in April, 1881, Hamilton Cole paid $8,000 for a paper copy, having seventeen leaves in facsimile. He sold it privately to Brayton Ives, and at the sale of his books, in March, 1891, it brought $14,800, being bougbt by Mr. James Ellsworth, who still owns it.

The first Hoe sale includes also his renowned copy of the first edition of "Le Morte D'Arthur," "reduced in to Englysshe by syr Thomas Malory knyght," and "deuyded in to xxi bookes chapytred and enprynted, and fynysshed in thabbey Westmestre the last day of July," 1485, by William Caxton. This, the most valuable of all Caxtons, on account of its fine condition and rarity, has a long and interesting history. In October, 1698, it was sold, in the library of Dr. Francis Bernard, physician to James II, bringing two shillings and sixpence. It was bought by Sir Robert Harley, first Earl of Oxford, who had it bound in red morocco and tooled in the style since known as Harlelan. Upon his death, in 1724, his library descended to his son, Edward Harley, the second earl, who died in 1741. The next year the library, including about 50,000 books, 41,000 prints, and 350,000 pamphlets (the greatest private collection ever brought together) was purchased entire by Thomas Osborne, the bookseller, for £13,000. Osborne issued a series of catalogues (5 vols. 8vo., describing more than 50,000 lots), and this copy of the "Morte D'Arthur" appears as No. 372 of Vol. III. The catalogue notes: "This was a favorite Book with King Henry VIII. See what a Character Ascham gives of it, in his Schoolmaster."

The book seems to have been purchased from Osborne by Brian Fairfax, the younger, who died in January, 1749. The Malory was valued by the appraiser at £2 12s. 6d. A catalogue of the library preparatory to a sale by auction was printed in April, 1756, but the whole was sold to Mr. Child of Osterley Park, Middlesex. It seems to have passed in 1804 into the possession of George Villiers, fifth Earl of Jersey, by his marriage with Child's granddaughter. It remained at Osterley Park, until the books were removed for sale at Sotheby's in 1885. The Caxton "Malory" was there bought by Quaritch for £1,950, for Mrs. Norton Quincy Pope, of Brooklyn, the most notable woman book-collector America has produced. In 1895, shortly after Mrs. Pope's death, her husband sold the library entire to Mr. Hoe.

One illuminated manuscript included in this sale is worthy of being mentioned with the two printed books already described. This is the famous "Pembroke Book of Hours," made for William Herbert, first Earl of Pembroke, who was beheaded in 1469. It was later in the possession of his grandson, William Herbert, in whose time, probably, some leaves, written in English, were added. Its further history is unknown until it turned up about 1880 in Italy in the possession of the Borghese family of Rome. From them it passed through an Italian antiquary into the possession of F. S. Ellis, the London bookseller, who sold it to Brayton Ives of this city. At the sale of his library, in March, 1891, it brougbt $5,900, and was bought for Mr. Hoe.

Correspondence

A NATIONAL LEGISLATIVE REFERENCE BUREAU.

To the Editor of The Nation:

Sir: Two bills introduced at the third session of the Sixty-first Congress, and noticed little, if at all, by the public press, are of much significance in the fight for more scientific and studied legislation. One at least will no doubt be again introduced.

Senator Owen of Oklahoma has proposed "to create a United States Legislative Reference Bureau" (S. 10,041), and Representative Nelson of Wisconsin would establish a "Legislative Division of the Congressional Library" (H. R. 31,536).

The legislative reference library as already established in nineteen States and several municipalities alms to give to the members of the Legislature or Municipal Assembly the opportunity of making a comparative study of the questions which come before them as lawmakers. The published experience of other commonwealths as embodied in their statutes, the actual results of the application of these statutes as given by those who must apply them, the literature of sociology describing the conditions of society which give rise to the necessity for new forms of legislation, the best thought of the scholarly theorists in political science, and the experience of those who are daily meeting and solving the complicated problems of modern administration—all this the legislative reference library aims to make available to its patrons.

Senator Owen's bill would have the chief of this bureau appointed by the President and would make its business

to locate, catalogue, and index all material in various government departments in the shape of bills, laws, debates, departmental research, findings of commissions, consular reports, treatises in legal brief and scholarly periodical, and so forth, touching upon problems of current legislation; to gather, catalogue, and index such further material pertaining to legislative experience at home and abroad as shall seem expedient.

Results shall be made serviceable, and in every possible way the enactment of more scientific legislation sball be aided. This bill is brief and carries no appropriation as drawn at present.

The House bill of eight sections provides that the Librarian of Congress shall appoint the division chief and in specific language sets forth with what high educational qualifications this chief must be endowed. His staff of secretaries, technical assistants, investigators, and draftsmen shall be of his own selection. While broad in scope this bill is far more specific and detailed than that of the Senate and carries witb it an appropriation of one hundred and fifty thousand dollars annually.

Legislative reference work so-called may be said to have had its beginnings in the New York State Library in 1891, when was issued "Legislation No. 1," a bulletin presenting a "comparative summary and index of State Legislation in 1890." The development in this field of library work since that date is significant. The Governor of Wisconsin, in his message to the Legislature in January, 1911, in asking for an increase in the appropriation for this department in his State to twenty-two thousand dollars a year, takes occasion to express his appreciation of its efficient service in the cause of careful lawmaking.

John Boynton Kaiser.

Austin, Tex., March 9.

SHAKESPEARE AND RALEIGH.

To the Editor of The Nation:

Sir: I am unable to find in any edition of the "Merchant of Venice" or elsewhere notice of the striking resemblance between Shakespeare's song, "Tell me where is fancy bred," and a poem which appeared in Davison's "Poetical Rhapsody" (1602), signed with the initials W. R. (See A. H. Bullen's edition of the "Poetical Rhapsody," Vol. II, p. 112.) It is hard to believe that the matter has escaped the attention of the lynx-eyed generations of editors; but if any discussion of the relation between these two pieces exists it has not yet found its way into the main current of Shakespearean commentary. The corresponding parts of the two songs are as follows:

Tell me where is fancy bred,
Or in the heart or in the head?
How begot how nourished?
Reply, reply.
It is engendered in the eyes,
With gazing fed; and fancy dies
In the cradle where it lies.

A POESY TO PROVE THAT AFFECTION IS NOT LOVE.

Conceit, begotten by the eyes,
Is quickly born, and quickly dies;

For while it seeks our hearts to have
Meanwhile there reason makes his grave;
For many things the eyes approve,
Which yet the heart doth seldom love.

For as the seeds, in spring time sown,
Die in the ground ere they be grown;
Such is conceit, whose rooting fails,
As child that in the cradle quails,
Or else within the mother's womb
Hath his beginning and his tomb.

Affection follows Fortune's wheels,
And soon is shaken from her heels;
For following beauty or estate,
Her liking still is turned to hate:
For all affections have their change,
And fancy only loves to range.

The letters W. R. in the "Poetical Rhapsody" are supposed to stand for Walter Raleigh; and this song has frequently, though not always, been printed among his works. The possibility of a literary relation, however slight, between Sir Walter and his great contemporary is of considerable interest; and it would certainly be worth while to bring to bear upon this poem any evidence which might help to establish its date or to confirm its authorship.

JAMES HOLLY HANFORD.

Simmons College, March 4.

JOHN TAYLOR "OF CAROLINE."

TO THE EDITOR OF THE NATION:

SIR: I have recently come into possession of a letter of John Taylor of Caroline which will interest students of American history, especially of secession. John Taylor's name appears in few of the encyclopædias of to-day, though he was one of the most influential publicists of his time. He was born in Orange County, Virginia, in 1750, and died in Caroline in 1824. He was an ardent revolutionist in 1776, a follower of Patrick Henry, and opposed to the compromising, perhaps loyalist, attitude of his uncle, Edmund Pendleton. Most ardent in his attachment to Virginia and to the States rights ideas in the early national career, he came soon to be counted with the little group of Jeffersonians to which Thomas New belonged, who desired a peaceable break-up of the Union. But Taylor was not a disunionist (Gaillard Hunt: "Disunion Sentiment in Congress in 1794," a pamphlet published in 1905); rather an idealist who hoped to see all government reduced to the irreducible minimum. He would have given no existence to corporations doing interstate business, he would have had no money but gold and silver, and he thought the ownership of stocks and bonds *prima facie* evidence of degeneration. He warred against the growth of economic and financial interests of the East, and lamented, especially from the economic point of view, the existence of slavery in the South.

In 1798 he espoused the doctrine of the Virginia and Kentucky resolutions and became Madison's ablest lieutenant in the ensuing conflict between the States rights and the Federalist school of politics in the Virginia Assembly. He thus had much to do with formulating the doctrine which the South was to adopt in justification of secession. After Jefferson became President he opposed some of the main items of the Republican programme, and when Monroo was made Madison's successor, largely because of Taylor's activity as a peacemaker between Madison and Monroe, he wrote that, though he would go a hundrod miles through a snowstorm to cast a deciding vote to make his friend President, he must be considered as an opponent of the Administration—because honest opposition was essential to keep the servants of the people in the right way.

Taylor was three times a member of the Senate, 1792-1794 by election, October-December, 1803, by appointment, and 1822-1824 by election again; and he might easily have had a seat there at other times had he so desired. He would have spurned appointment to any office under the Republican Presidents, all of whom, however, were on terms of intimacy with him during their Administrations. He was one of the first of the race of mugwumps, a prince of independents, and also a writer of many books, now little known, as will be seen from the following list: "The Spirit of Seventy-six" (1809), "An Inquiry into the Principles and Policy of the Government of the United States," a reply to John Adams's work on the Constitution (1814); "Arator," a series of agricultural essays (1818), "Construction Construed," an attack on the judicial opinions of Chief Justice Marshall (1820); "Tyranny Unmasked" (1822), and "New Views of the Constitution of the United States" (1823).

He was a member of the Senate at the time of his death in 1824—a man of such prestige and influence that Presidential aspirants of 1824 made pilgrimages to his retired Virginia home seeking his approval. Few men who wrote so much, were so long in the public eye, and who deserved so well of the country, have been so ignored in works of reference or general information. Hence the following letter, bearing upon an important crisis in our history, and counteracting, as it does to some extent the view of so many students of the Jeffersonian epoch, is offered to the readers of the *Nation*.

WILLIAM E. DODD.

University of Chicago, March 2.

Virginia, Port Royal, Dec. 30, 1820.

Dear Sir: Your letter has reached me, but the gentlemen it introduces have not appeared. Their company would have been very agreeable to me, and an exchange of opinions, when neither a spirit of opposition nor the allurements of victory would prevail, might have been somewhat useful.

I hardly understand what you mean by the "New School." If this phrase refers to the notion of constituting a geographical party by the cement of a temporary impression concerning slavery, the policy will have no permanent effect, except in accelerating the dissolution of the Union; because solid geographical interests will inevitably obliterate a contemplative opinion naturally transitory. If it refers to the notion of contriving laws for making one portion of the Union tributary to another, that policy is equally unsustainable for any considerable period; because, though the Southern States might long submit to their commercial disadvantages, so beneficial to the Northern, they will not long bear an aggravation of them by geographical legislation. Whenever a dissolution of the Union happens, both these projects will fail, and the Southern confederation will either embrace most or all of the waters of the Mississippi, or the confederations will be Eastern and Western. I cannot see what interest can induce the Northern States to wish for either.

These strange geographical concussions seem to have put a more useful subject, that of weights and measures, out of the mind of Congress. More useful, because a cement of the Union by an uniformity in this respect, however small, is preferable to disuniting projects, however great. I lately was present at a delivery of grain, where three sealed half-bushels and two stamped fifty-six weights were produced. No two of the former agreed, and the difference between the largest and the smallest extended to a quart. One fifty-six weighed by the same pair of stilliards above fifty-nine, and the other above fifty-eight pounds. Upon information entitled to much credit, it is probable that the frauds committed by false weights and measures are innumerable, and that they play in a scope of 10 per centum at least. Indeed, the half-bushel is gradually growing towards a whole one. Vice, distrust, and even some degree of enmity between States are thus generated, together with commercial inconveniences to a great extent. If Congress should only establish a common half-bushel, and a true avoirdupois pound for the present, it would be highly beneficial. The English Winchester bushel would be the best, as being about the medium of these frauds, and because our commerce with that nation and its dependencies, in articles of dry measure, may again be greater than with any other. You see, my mind yet clings to the Union, as a man in a consumption does to life. Farewell. Yours with great regard,

JOHN TAYLOR.

ORIENTAL POETRY.

TO THE EDITOR OF THE NATION:

SIR: That little poem of Yone Noguchi given by your correspondent, S. Tsushima of Kamakura, in your issue of February 16, has no doubt set many readers thinking about the difference between Eastern poetry and our own. A little acquaintance with the poetry of the T'angs shows easily the source of the leading ideas in the verses quoted. The voice of the bell, the shadow, the breeze, the moon, the mountains and rivers, the flower petals, the flash of the stirred leaf, the whispering of the wind in the grass—these may almost be called the stock in trade of the T'ang poets. And so we may assume that in that branch of Chinese literature Yone Noguchi must be deeply read. The combining of these various elements to express some special moment or phase of individual experience is also the method of the T'ang poets, and that is exactly the method of the verses in question, which might indeed be the product of the Buddhist or Taoist tendency in a T'ang poet.

In that poetry, then, what is it that, being different from our own, is yet so attractive? Is it not the contemplation of nature as a play of vast forces in a sphere of their own, independent of and superior to any particular human interest? Our poetry may be said to centre in man, of whose situation and activity nature is merely the background or the instrument. Eastern poetry centres in nature with its imperious motions, its inscrutable laws, its tranquillity and beauty, over against which man appears from time to time, not to change but to contemplate and admire.

This is, of course, the most superficial, as it is the most salient, idea of Eastern poetry, but I have found it a solvent of many difficulties, and a stimulus to further curiosity regarding a mode of thought which though apparently so different, is yet, in a way, the natural complement of our own. In fact, might not one hazard a guess that Eastern thought in general may prove to be rather complementary than supplementary to ours, the other side, as it were, of known experience, rather than additional knowledge; and that a certain roundedness

of culture may perhaps in time result from increasing interest in and knowledge of the East. Yone Noguchi is one of the pioneers of this new knowledge, and I have no doubt that many lovers of poetry will, like myself, feel the attraction of his lines, even if at first we may have to grope around somewhat and feel our way in the unfamiliar but truly poetical Eastern setting.

JAMES BLACK.

Denver, Col., March 4.

Literature

FOLKLORE OF GREECE.

Modern Greek Folklore and Ancient Greek Religion. By John Cuthbert Lawson. New York: G. P. Putnam's Sons. $4 net.

Mr. Lawson has devoted the leisure of ten years to working up into a solid and interesting book the collections of Greek folklore which he made in Greece during his two years' tenure of the Craven studentship from 1898 to 1900. After studying the fear of the evil eye, as a first and typical illustration of the survival of ancient superstitions, he proceeds to an exhaustive survey of the entire mythology from Zeus and Poseidon to Pan and the Nymphs. This attempt at systematic completeness results in some perfunctory chapters. There is not much real evidence for the survival of the greater gods. The only testimony for Zeus is a Cretan invocation, Ζῶνε θεέ, which Mr. Lawson himself has not heard, but takes from Santzos. The functions of Zeus, including the duties of clerk of the weather, are transferred to God or distributed among the saints. The modern Greek word ἀστροπελέκι suggests the reflection, that "though in the ancient literature, we may nowhere find the word πέλεκυς used of the thunderbolt, there is no reason why the modern word should not be the expression of a conception inherited from antiquity." Of like character is the evidence for Poseidon and "Lady 'Phrodite." Demeter and Persephone yield more. St. Demetrius is the patron of agriculture. But at Eleusis, the peasantry are said to have worshipped a statue of Demeter as St. Demetra so late as 1801. The legend of Demetra's wanderings, as related by an Albanian priest to Lenormant in 1860, we cannot regard as confirmation. It is obviously contaminated by literary reminiscence. Nor is it probable that the occasional acceptance in Greece of the Mohammedan taboo of the pig goes back to the Demeter cult. Curious is the survival in Arcadia of the divinity Despoina, to which Mr. Lawson is, he believes, the first to call attention.

Charos supplies material for one of Mr. Lawson's best chapters. But the ideas, the imagery, the conceits, and the jests are those which human fancy associates with death from the pages of Lucian to those of *Life*. And to uphold his unhesitating identification of Charos with Charon, Mr. Lawson is driven to "suspect that in ancient times the literary presentation of Charon was far more circumscribed than the popular." For the survival of the coin placed in the mouth of the dead, Mr. Lawson has only hearsay evidence. He could not elicit any positive statement that it was the ferryman's fee. The Fates, too, embody a universal commonplace, and the many interesting stories collected and plausible analogies noted prove little. In short, we may be very grateful to Mr. Lawson for the immense stores of entertainment and instruction presented in this volume, and yet retain some reserves as to his main thesis, *i. e.*, that Greek folklore is a real survival of classical mythology. Skepticism is always in place with regard to travellers' accounts of popular beliefs. The imagination of the people is constantly fed by imperfectly apprehended suggestions that filter down to it from above, and about which the accretions of popular fancy cluster. This is especially true of a people that possesses the great literary tradition of the Greeks and takes such pride in it. The population of nearly every canton of Greece has been repeatedly shifted, exterminated, and replaced. The one abiding fact is the pride of the Greeks in the language and the writings of the ancients. In the democratic fellowship of Greek life, there have always been fluent talkers with some tincture of letters whose conversation would supply hints to the imagination of the illiterate. Both in language and fable, then, the hypothesis of revival is always to be weighed against that of survival. If you meet the phrase (σπεύδειν) ἀπὸ ῥυτῆρος in the mouth of an uneducated Greek to-day, you do not assume either that it is a genuine survival or that he has read the "Œdipus at Colonus." He has heard it from somebody who read it in a newspaper paragraph written by some gymnasium graduate. This is an extreme but actual instance which illustrates the possibilities. Some similar process seems to us the most probable explanation of many of the stories related by Mr. Lawson on the authority of Schmidt, Santzos, or Lenormant.

Especially interesting are the rich chapters about the Nymphs, Nereids, and minor figures of mythology and folklore. Are we really to believe that the female demons, the Gelloudes, are derived from Sappho's Gello? From a table of twenty-three spellings of the name and on other good and valuable considerations, Mr. Lawson decides that those mischievous monsters of popular fancy, the Callicantzari, are the Centaurs. The equine half of the Centaur was merely a symbol of his power of assuming any animal shape. The Centaurs were a tribe of reputed sorcerers whom their Achæan neighbors held in awe for this gift and termed Pheres. This, if not true, is at least admirable romantic philology of the new anthropological type.

The second half of the volume deals with more general religious conceptions and superstitious practices. Mr. Lawson finds survivals of divination from the flight of birds, chance words, sneezing, the lines in the shoulder-blades of sheep, and, in one case, from a pig's spleen. A study of vampires introduces the whole question of *revenants* and bloodguiltiness. The words *alastor*, *miastor*, and *prostropaios*, all refer primarily, he thinks, to the vengeful *revenant* wandering in bodily form. The "Mycenæan" inhumation and the "Achæan" cremation, both had for their object the normal dissolution of the body, which put an end to such wanderings on earth, and at the same time made possible the reconstitution of the corpse's elements in a corporeal and happy life beyond the grave. The blessedness of that life consisted in a reunion with the gods, which is described explicitly and not figuratively as a marriage. The literary parallelisms between marriage and death, from the "Antigone" to the latest epigram, are to be taken literally in this sense. The "Pelasgian" mysteries of Eleusis represented the consummation of this union of the human and the divine, and so provoked the indignation and the calumnies of the Christian Fathers. The love philosophy of Plato's "Symposium" has its source in the same order of ideas. To test and criticise these interesting suggestions would far exceed our scope. It is all systematically developed with intense conviction, an enormous mass of illustrations, and the citation of many authorities. It will have to be reckoned with. But it will first have to be verified. Like other systematic reasoners, Mr. Lawson is sometimes tempted to force the facts to fit the system. He translates Æschylus, "Coephori" 287-8:

πάντων δ' ἄτιμον κἄφιλον θνήσκειν χρόνῳ
κακῶς ταριχευθέντα παμφθάρτῳ μόρῳ,

"To die at last with none to honor, none to love him, *damned even in the doom that wastes all, to know no corruption.*" (Italics ours.) Æschylus is thus made to confirm the view that the object of cremation and inhumation alike is the dissolution of the natural body, and that the failure of such dissolution is the most awful of curses. But the translation is flatly impossible. The muse of conjectural, romantic anthropological philology is a fascinating creature, but she cannot be exempted from the primary duty of construing her Greek correctly.

CURRENT FICTION.

Denry the Audacious. By Arnold Bennett. New York: E. P. Dutton & Co.

Like "Helen with the High Hand," this is a diversion on Mr. Bennett's part. No doubt "The Old Wives' Tale" and "Clayhanger" represent his serious work; but, much to our advantage, he is of the temperament which disdains to be always wise. The Denry of this divertisement is another Clayhanger in origin and environment, but he exists upon an altogether different plane of Mr. Bennett's fancy. His mother is a sempstress and washerwoman, living among the "potbanks" of Bursley; and "Denry" is her time-saving rendering of Edward Henry. The boy shows no special promise. In the course of everyday life he is commonplace enough. But at decisive moments he has an instinct for action, gloriously rash and gloriously successful. Copybook morality does not deter him: he is a Five Towns Napoleon, following his star. In short, as "Clayhanger" is a soberly ironical study of the humdrum, "Denry the Audacious" is a blithely ironical study of the inspired. In his own sphere, Denry breathes the true afflatus. His career is a series of *tours de force.* Bursley is proud of his feats, vaunts him as a "card," and finally awards him the supreme honor in her gift. The tale of his exploits is told with much good humor—it is hardly more than a clever bit of fooling. A reader unfamiliar with Mr. Bennett would not be likely to credit the writer of this story with powers beyond those of a pleasant entertainer. But there are unexceptionable precedents for genius entertaining itself with the play of mere talent. Mr. Bennett's versatility of mood is more remarkable than his virtuosity of method.

Adventure. By Jack London. New York: The Macmillan Co.

This is upon a different plane from Mr. London's recent novels. It is free from didacticism, has no remonstrance or propaganda up its sleeve, but disports itself frankly in the realm of the agreeably preposterous. The time is the present, the place is the Solomon Islands, and the persons—the only necessary persons—are an Englishman and an American girl. The man is in solitary charge of a plantation manned by cannibals, who are an unusually bad lot, even for cannibals. The island is fever-stricken when the scene opens, and the white man, who is himself sick almost to the point of collapse, maintains his life and his authority solely by virtue of that miraculous function which, according to the muse of imperialism, enables the Briton to bear his burden. Shipwreck brings the girl upon the scene in the nick of time. She takes charge of the sick man and his affairs, and he recovers to find her established in his household, and virtually refusing to budge. She laughs at the qualms and scruples that agitate his conventional soul, and proposes a business partnership. As an alternative she threatens to buy an island and acquire cannibals of her own. Her bodyguard of big Tahitians she regards as all that can be desired in the way of chaperonage or other protection. Of course, there is only one thing that can happen at the end of the road, and the interest for the hardened observer must lie in the incidents by the way. These include a revolt on the part of the resident cannibals, and the pursuit of some of them far into the enemy's country. Gory details are not lacking, horrors of the sort upon which Mr. London's readers are wont to sup. One learns, for example, the exact method of smoke-curing a human head for the Solomonian trophy-room. But the flavor of the tale as a whole is that of a milder type of romance than Mr. London is in the habit of offering his public.

The Andersons. By S. Macnaughton. New York: E. P. Dutton & Co.

Flora Anderson, an able young Scotchwoman resolved on matrimony, and her animadversions upon a halting lover furnish the sustaining interest in this extended narrative. The plot—both rudimentary and trite—is comprised in the disastrous excursion of a middle-class Scotch family into London society and their prompt rescue by auld acquaintances. Though candidly deploring her ill luck, Flora takes no shame from her situation, which she invests with the dignity of a sociological instance. "When the supply does not equal the demand, there is always a fictitious value set upon even the most worthless goods. One million more women than men in the British Isles——" And, indeed, the pressure exerted by this calamitous circumstance is plainly apparent upon all the marriageable women in the book. The initial difficulties attending the cooking of the hare, where hares are leanest and wariest and excellent cooks abound, have seldom been more frankly and feelingly expounded. But it is from the writer's keen flair for native idiosyncrasy and her skill in depicting Scotch *genre* scenes, rather than from her insistent harping on this theme, that the reader's enjoyment is derived.

Basset: A Village Chronicle. By S. G. Tallentyre. New York: Moffat, Yard & Co.

This is a little masterpiece of historical perspective and imagination. You must rid yourself of the prevalent predisposition, in favor of a clearly defined plot, in order to enjoy properly a modern representation of early Victorian village life, which is like nothing in the world but Trollope seen through a reversed opera glass, unless it be Mrs. Gaskell *en plein air.* Every member of the group constituting a typical English rural community of seventy years ago is drawn as if from life; the artist's estimation of character values is that of her own day and generation, but the characters themselves belong indisputably to the period which she undertakes to re-create, and she has enveloped them in an atmosphere that is not merely decorative but vital. Some changes in personal relationship work themselves out slowly to a satisfactory issue in the course of the chronicle; the situations are significant and often humorous, but never approach a dramatic pitch, except on the occasion when an eloping bride disappoints a waiting congregation. There is a hint of altering conditions in the intrusion of a young London physician upon an old country practitioner's preserves, and a glimpse of the then fashionable affectations exemplified in the persons of a clever frump and her son, a foppish *littérateur.* Upon closer examination, it will be realized that this village group comes near to epitomizing the national life of its decade. Balzac himself might have sketched such a figure as the village parson, whose clumsily assumed cloth conceals a veteran of the Peninsular campaign and an unsuspected hero of knightly adventure.

LORD ACTON ON THE FRENCH REVOLUTION.

Lectures on the French Revolution. By John Emerich Edward Dalberg-Acton, First Baron Acton, D.C.L., LL.D., etc., late Regius Professor of Modern History in the University of Cambridge (England). Edited by John Nevile Figgis, C.R., Litt.D., and Reginald Vere Laurence, M.A. New York: The Macmillan Co. $3.25 net.

Since Lord Acton's lamented death nine years ago several volumes of his writings have appeared which have won for him a fame wider by far than he enjoyed in his lifetime; for though the very small circle that knew him personally had the warmest admiration for his powers, his very name was unknown to the great bulk of Englishmen as well as Americans. First came his "Letters to Miss Mary Gladstone," then a volume of lectures, put together from the notes of his pupils, together with two volumes of collected "Essays"; and now we have this volume of university discourses on the French Revolution which were the fruit of his latest years. They form the most considerable single and continuous piece of work he ever did, and probably would never have been composed but for the necessity that lay upon him of preparing lectures for a class. His passion for striving upwards toward the ideal he had set up of fin-

ished literary form, coupled with the passion for accumulating facts and hunting everywhere for new sources, prompted him to keep back for further elaboration whatever he wrote. These lectures would doubtless have been much enlarged as well as polished for publication had he lived longer. But his fastidiousness might have refused to let them appear at all, and we may well be thankful for what we here and now receive as the last fruit off a wonderful tree.

Like everything else that Lord Acton produced, these Lectures have that charm which is felt both in conversation and in reading when one finds one's self in contact with a full mind, a mind that gives forth out of a store so abundant that one knows it could give much more than it has given, and that the opinions it delivers, be they right or wrong, are based on a wide range of knowledge. There is also here, as usually in Lord Acton's writings, a curious un-English quality which imparts to them a certain piquancy. There is a perfect command of materials and a power of referring to out of the way sources which is characteristic of the German scholar, and along with these aptitudes, there is also a fondness for anecdotes, especially those which turn on some pointed saying of historian or essayist which reminds one of the French. Indeed, not infrequently his own way of summing up a view in an epigrammatic phrase reveals the influence of French models. The phrases are often excellently turned, but they have sometimes that fault of luminous obscurity which is the weak point of an epigrammatic style. One finds in this volume aphorisms which sound striking, and which obviously do contain the results of careful thought, yet the meaning and bearing of which are far from clear. That this defect cannot be altogether due to the form of lectures in which the book appears, is shown by its appearance in some of Lord Acton's articles collected in the volume published in 1907.

No modern theme is so well worn as the French Revolution of 1789-99. But these Lectures make it as interesting as a romance, at least to those who will bend their minds to master the full sense of what is given, for the strenuous thinking of the writer requires a corresponding exercise of thought in the reader. Few historical treatises of more solid value have been published in our language for a long time past. Nearly all the English books describing the Revolution have been either narratives of events, or studies of the more conspicuous figures. Thomas Carlyle's History, the best known of them all, was written some eighty years ago, when the materials available were far inferior to those we possess to-day. It is a splendid piece of literature, but it passes lightly over the constitutional part of the story and tells us little either of the ebbs and flows of surface opinions or of the underground forces which were at work. A good deal of it has been rendered obsolete by the discovery and examination of sources unknown when Carlyle wrote. In that most instructive review of the literature of the subject, which we find in the appendix to these Lectures, Lord Acton says of Carlyle's book:

> The vivid gleam, the mixture of the sublime with the grotesque, make opponents forget the impatient verdicts and the poverty of settled fact in the volumes that delivered our fathers from thraldom to Burke. They remain one of those disappointing storm clouds that give out more thunder than lightning (p. 358).

Passing in review the books of Droz, Lamartine, Louis Blanc, Michelet, Villiaumé, Genoude, Gabourd, Barante, Tocqueville, Duvergier de Hauranne, Laboulaye, and some memoir writers, such as Mallet du Pan and Malouet, Lord Acton awards the highest praise to Sybel, Taine, Sorel, Dareste and Aulard, not as necessarily the greatest writers, but as the most useful for the several sides of the subject which they treat. There is nothing better in the volume than this fine analysis of the historians of the Revolution, rich with weighty judgments and glittering with vivacious anecdote. No living man outside France could have composed a survey so full of knowledge, and of that kind of knowledge which is derived not wholly from books, but from intercourse with the best minds of France and Germany.

The distinctive note of these Lectures, as compared with other English books and most French books on the subject is their careful study and exposition of the constitutional side of the movement and of the ideas which animated its leading spirits. To trace those ideas is no easy task, for in the four years between the meeting of the States General, in May, 1789, and the voting of the Constitution of June, 1793—an instrument which never, in fact, took effect—there was an incessant conflict of theories and doctrines, so that almost every form of constitutional monarchy, of moderate republicanism, and of democracy, both representative and direct, had its exponents and advocates. Among the theorists, the clearest as well as most resourceful and inventive thinker would seem to have been the Abbé Sieyès; and, so far as any person can be called a revolutionary hero in Lord Acton's view, Sieyès, "the most perfect representative of the Revolution," is that hero. At any rate, this book is the first one in our tongue in which the gifts and the influence of this remarkable person, whose eminence Talleyrand (in his posthumous Memoirs) acknowledges, malignant as his comments are, have received due recognition:

> As a priest without a vocation he employed himself with secular studies and mastered and meditated the French and English writers of the age, politicians, economists, and philosophers. Learning from many, he became the disciple of none, and was thoroughly independent, looking beyond the horizon of his own century. He understood politics as the science of the State as it ought to be, and he repudiated the product of history which is things as they are. He turned resolutely from the past and refused to be bound by the precepts of men who believed in slavery and sorcery, in torture and persecution: Sieyès was essentially a revolutionist because he held that political oppression can never be right and that resistance to oppression can never be wrong. He was a royalist, not as believing in the proprietary right of dynasties, but because monarchy, justly limited and controlled, is one of many forces that secure the liberty which is given by society and not by nature. He was a Liberal, for he thought Liberty the end of government, and defined it as that which makes men most completely masters of their faculties, in the largest sphere of independent action. He was also a democrat, for he would revise the Constitution once in a generation; and he described the law as the settled will of those who are governed, which those who govern have no share in making. But he was less a democrat than a Liberal; and he contrived scientific provision against the errors of the sovereign nation. He sacrificed equality by refusing the vote to those who paid no taxes, and he preferred an elaborate system of indirect and filtered election. . . .
>
> He became odious to Robespierre, who, after the fall of Danton, turned against him and required Barère to see what he could be charged with. The Abbé's nerves never quite recovered from the impressions of that time. When he fell ill, forty years later, and became feverish, he sent down to tell the porter that he was not at home if Robespierre should call. What I have just said will give you a more favorable view of Sieyès than you may find in books. The Abbé was not a high-minded man, and he has no friends in his own country. Some dislike him because he was a priest, some because he was an unfrocked priest. He is odious to royalists as a revolutionist, and to republicans as a renegade. I speak of him as a political thinker, not as a writer, an orator, or an administrator. Certain papers have recently come to light tending to show that he was as wicked as the rest of them. They would not affect my judgment on his merit as a thinker (pp. 159-163).

We have made these long quotations from the estimate of Sieyès, not only because the view presented will be novel to most readers, but also because they are a good instance of some of Lord Acton's qualities, thoroughness, vigorous independence of judgment, the habit of looking at a man all round, the gift of enlivening disquisition by anecdote. There are, in these Lectures, many briefer, but equally striking characterizations of famous figures, such as Necker, Mirabeau, Danton, Dumouriez, Charlotte Corday, Marat, Robes-

pierre. The judgments passed are, most of them, severe. Lord Acton is what used to be called in England (in the older days) "a hanging judge." Revolutions are said to bring unscrupulous men to the top, or to make the able men who come to the top unscrupulous; but few revolutionary epochs show so high a percentage of wickedness as this does. Even the Girondins, whom we used to be taught to esteem and pity, fare almost as ill at Lord Acton's hands as at those of Carlyle. The eloquence of Vergniaud wins for him little indulgence; it is only the courageous Lanjuinais whom we are permitted to respect. Among them all, Robespierre and his immediate group retain a sort of hateful primacy in bloodshedding, though Danton, with his massacre of September, is really no better, while Tallien, Collot, and the other Thermidorians are just as brutal and ruthless as the dictator whom they overthrew. Rightly, as it seems to us, Lord Acton finds for the crimes committed by all the factions, no great palliation in the intoxication of the people with the ideas of freedom and equality, or in the panic created by the foreign invasions. More vulgar causes—revenge, the ferocity of those whose savage impulses were set free from the usual restraints of law, the excitement of destruction, and the selfish ambition of faction leaders seeking power for themselves, sufficiently explain the action of the chief movers and the ruffians who followed them. That which the sense of danger from without did, was to make the larger mass of the Parisian populace acquiesce, or regard with stolid apathy horrors which, had that peril been absent, they might have been roused to check.

The sternness of our author's attitude strikes us most when we come to his arraignment of the King and Queen. Louis XVI was not a wicked man. He generally wished to do right, and on the few occasions when he showed firmness, it was in defence of a principle. Several times, indeed, he played a double part, and conspired against those who had wrested power from him, in a way that might be called treasonable, but this course could easily, to a man who saw how things were rushing downwards to the abyss, seem justifiable in the interests of France, as well as in his own. His excuse is better than that of the English Charles the First, when the latter stood in a somewhat similar position. Lord Acton, however, passes sentence in these words:

> To absolve him is impossible, for we know, better than his persecutors, how he intrigued to recover uncontrolled authority by bringing havoc and devastation upon the people over whom he reigned. The crowning tragedy is not that which Paris witnessed when Santerre raised his sword, commanding the drums to beat, which had been silenced by the first words of the dying speech; it is that Louis XVI met his fate with inward complacency, unconscious of guilt, blind to the opportunities he had wasted and the misery he had caused, and died a penitent Christian, but an unrepentant King (p. 255).

If history weighs the demerits of men by the results of their errors and their weaknesses, those of the unhappy king will be heavy indeed:

> At every step downward, the King and Queen were the authors of their own disaster. The French republic was not a spontaneous evolution of social elements. The issue between constitutional monarchy and the republic was decided by the crimes of men and by errors more inevitably fatal than crime. There is another world for the expiation of guilt, but the wages of folly are payable here below.

Though the book is not so much a narrative history as a series of running comments upon events, and especially on those movements of opinion which were the most important among the events, it would be unfair to forget to note the author's qualifications as the teller of a story. This is the only one of his books in which he appears in that capacity. The art of narrative is one in which he had little practice, yet every now and then he reaches high excellence. The general march of political change, the succession of events by which the revolutionary movement advanced and prevailed, is, indeed, not very clearly given. So much is assumed as known, or is told by allusion, that in most chapters the reader wishes for some sort of chronicle with dates to help him. But particular episodes are often told with a freshness and graphic force which make one feel the author's imaginative power. The description of Maillard's march to Versailles and its consequences is admirable. In Thomas Carlyle's book, there is no finer passage than the account of the Flight to Varennes. Lord Acton's description is less passionate, less highly colored, perhaps less thrilling. But it is not only far more accurate, an easily gained advantage because much new material has been discovered since Carlyle wrote, but equal in dramatic interest, because we are made to feel at almost every hour of the long and fateful day what was passing, and how the persons were acting upon whose coöperation the fortunes of the enterprise depended. Not infrequently we find in Acton's writings not only the raconteur's love of anecdote, but also a tendency to search for the causes of great events in small ones, sometimes because the small one happened at a critical moment, sometimes because, though not decisive in itself, it revealed the quality of character in which success or failure lay. Many of the anecdotes are new, some of great interest, such as those given on p. 223 about Dumouriez, and those on pp. 245-7 about the massacres of September 1792. Some few will be found surprising, such as the following about Pitt's relations with Danton (p. 254):

> Information was brought to Pitt, from a source that could be trusted, that Danton would save the King for £40,000. When he made up his mind to give the money, Danton replied that it was too late. Pitt explained to the French diplomatist Maret, afterwards prime minister, his motive for hesitation. The execution of the King of France would raise such a storm in England that the Whigs would be submerged.

Hardly anybody comes well out of the story of these years. The sovereigns of Europe and their ministers are less cruel but hardly less selfish and callous than the revolutionists of 1792-6. Mirabeau took money, Danton took money, Robespierre's reputation for not taking it helped him to be more horrible than any one else, except indeed Marat. Has public conscience improved since those days, as we all like to believe? Lord Acton answers gloomily. Speaking of Danton and Robespierre and the massacre of September, he says:

> We are in the company of men fit for Tyburn. I need spend no words in impressing on you the fact that these republicans began with atrocities as great as those of which the absolute monarchy was justly accused, and for which it justly perished. What we have to fix in our thoughts is this: that the great crimes of the Revolution, and crimes as great in the history of other countries, are still defended and justified in almost every group of politicians and historians; so that, in principle, the present is not altogether better than the past (p. 248).

He might have added that the massacres of Corcyra in the fifth century, B. C., were not worse than St. Bartholomew's Day at Paris in the sixteenth, A. D. Thucydides was horrified by the former, and we all know how Papal Rome received the latter. But Lord Acton's condemnation of the Revolutionists does not affect his view of the Revolution itself. To him it marks an immense onward step in the march of mankind, a thing to which we are all today indebted for some of the political benefits we enjoy.

One Way Out: A Middle-Class New Englander Emigrates to America. By William Carleton. Boston: Small, Maynard & Co. $1.20 net.

This is a most interesting book, well-written and straightforward. More than that, it is a really notable brief for democracy that everybody ought to read who is fearful of the effect upon our institutions of our new citizens from overseas. The story is a simple one. The narrator—it is asserted that the book is a narrative of actual experience—was a clerk in a large corporation trying, on a meagre salary, to make both ends meet, and limiting his family to one child in order to make possible that

standard of comfort demanded by convention in the suburb in which he lived, when he suddenly lost his position. Having no savings, and having no acquirements save those of a routine clerk, he found himself at thirty-eight unable to go West or to procure reemployment. In most books of this kind the "way out" is to go back to the land, to wring a livelihood from some abandoned New England farm. Instead, this hero went to a new tenement and began life again, in the topmost flat, with the aid of his admirable wife, and as a day-laborer. How they lived on $9 a week and how "Carleton" won his way upward is absorbing reading. Some housekeepers may question the financial statements given; the very finical might even point out a place or two where the narrative is vulnerable, but it is a stirring human document nevertheless, for the reason that it shows how the stream of immigration quickens our whole national life, and because it concentrates in one human experience much of the romance and the opportunity of America—the freedom to rise that brings the foreign masses to our shores. This particular American who, as he says, "emigrated to New England," illumines in his book a large part of the natural phenomena of our democratic life, besides showing in an admirable way the fine things that adhere to honest manual labor and the cramping effects of middle-class convention. It is a bit of stimulating Americanism that ought to find a place in our school libraries next to Jacob Riis's "The Making of an American," for its emphasis is always on the things that are really worth while.

Gray Days and Gold. By William Winter. Revised edition. New York: Moffat, Yard & Co.

More than twenty years have elapsed since William Winter first published his delightful notes of travel in the British Isles. The public appreciation of them is best proved by the fact that they have passed through fifteen editions. Now they reappear, after careful revision, and with much additional matter in the new and handsome form chosen for his collected works, with all the advantages conferred by noble type, fine paper, ample margins, and copious illustrations of singular refinement and beauty. In the earlier volumes, articles on Scottish scenes and places were included. These have been reserved for a later book. The present papers, twenty-four in number are devoted, with one exception, to English subjects and two-thirds of them are virtually fresh. It would be difficult to exaggerate their charm. Everybody familiar with any of Mr. Winter's critical or other writings, knows that he is a master of rich and melodious English. In the past, his facility of utterance has betrayed him occasionally into exuberance. But these essays, evidently a labor of love to him, are models of musical prose and are free from redundance. To all educated travellers along the route which they follow—from Southampton to the Scottish border—they will prove an invaluable and fascinating guide to the spots most notable for their historic interest, literary association, or natural loveliness.

The whole book is charged with full and accurate scholarship, especially on subjects connected with the life, the creations and the times of Shakespeare, but is exempt from all taint of pedantry. It is a felicitous blend of pleasant and informing gossip, brilliant description, delicate and poetic perception, and grave reverie. One of its greatest charms lies in its reflection of the author's personality, his poetic susceptibility, his appreciation of the exquisite or the sublime, his alert humor, and his vein of philosophic pathos. It would be easy to quote many passages illustrative of his keen critical faculty —from his tributes to Byron, Tennyson, Wordsworth, Matthew Arnold, and others—or of his rare gift of eloquent and realistic description in picturing the beauties of Stratford-upon-Avon, or the solemn magnificence of old cathedrals, but the value of this book is not to be tested by samples. The intelligent reader who opens it will not lay it aside until he has absorbed all that lies between the covers, and he will be grateful to the man that produced it.

Cecil Rhodes: His Private Life. By his Private Secretary, Philip Jourdan. New York: John Lane Co. $2.50 net.

The appearance of a third book about Cecil Rhodes within eight months witnesses to the interest which is felt, or which English publishers believe to be felt, in England in the character and career of a man whom the swelling wave of what is called "Imperialistic sentiment" has raised to surprising prominence in Great Britain as well as in South Africa. We have so recently, in reviewing the two books about Rhodes written by Sir Thomas Fuller (*Nation* of August 25, 1910), and by Sir Lewis Mitchell (*Nation* of March 16, 1911), commented upon that character and career, that all we need do in noticing this third book is to call attention to the further light, such as it is, which is here thrown upon Rhodes's personality. Mr. Jourdan writes with the pardonable enthusiasm of a private secretary to whom the hero has not ceased to be a hero, intimate though his knowledge is. His book is filled with a series of incidents or anecdotes calculated to show Rhodes in a favorable light as a kindly, generous, warm-hearted man, loyally steadfast to his friends, and seldom personally bitter towards his opponents. His occasional fits of impatience or ill temper are not altogether hidden out of sight; nor are other blemishes denied. The biographer admits the quarrels with Gen. Kekewich during the siege of Kimberley and deplores the passion for bridge-playing which Rhodes contracted in his later years and which, as it induced him to sit up late at night, involved the discontinuance of the early morning rides that had theretofore kept him fresh and vigorous through many toils and vicissitudes. But Mr. Jourdan refutes the calumnies which were circulated about Rhodes in his later years—that he was in the habit of betting, that he gambled in stocks, that his habits were intemperate, that his private life was lax. All these charges, and especially the two latter, are declared to be baseless calumnies: and this seems to be proved by plenty of concurrent testimony from those who had the best means of knowing. We are accordingly ready to believe that Mr. Jourdan's denial of them is sincere and ought to be accepted. He renders a service to the memory of Rhodes by telling in detail the story of the lady, described in the book as of Russian birth, who persecuted him by her attentions, circulated false stories about him, and was ultimately convicted of having forged his name to promissory notes. The account here given completely clears Rhodes, whose life was shortened by these occurrences, for he went from England to South Africa in order to give evidence at the trial, and, being already in weak health, suffered severely from the journey. His medical advisers had warned him of the risk, but he felt that he must at all hazards give in court evidence needed to vindicate his character.

The book, as we have said, is slight and anecdotal rather than historical. It is not always correct, in its facts, nor even in the account of Rhodes's own opinions about other men, and it fails to grasp some of Rhodes's most interesting traits. But it gives an interesting and self-consistent picture of a man of remarkable practical gifts, who cared little for the smaller things of life, being indifferent to comfort or luxury and unmindful of dress, who had no pronounced literary tastes, except for Roman history, and no definite religious opinions, though he was ready to subscribe for religious purposes. All his energy was reserved for the large schemes he was constantly revolving, and into these he threw himself with untiring persistence. He expected all whom he employed to display the same vigor and persistence. If they succeeded, he rewarded them liberally. If they failed, he cast them aside without ruth. He was often brusque and impatient, but not spiteful or vindictive. He loved power and glory with a passion which made him occasionally

transgress the bounds which conscience and honor ought to have set; but his aims were not selfish and his desire for fame did not lapse into the lower forms of vanity. Altogether a man in whom, with all his faults, there was much to like as well as to admire.

Notes

"The King Over the Water, or the Marriage of Mr. Melancholy," is the title of a novel dealing with the old Pretender, which Justin H. McCarthy is publishing with Hurst & Blackett.

Messrs. Hutchinson are bringing out "Parodies Old and New," by Stanley L. Adam.

Sir A. T. Quiller-Couch's new novel, "Brother Copas," will come this month from the Scribner press. The same house has in its list Price Collier's, "The West in the East from an American Point of View."

Henry Holt & Co. have contracted with Dr. Frederic Taber Cooper for a volume on representative American story-tellers.

Dante's "Purgatorio," edited by Prof. C. H. Grandgent, after the manner of his edition of the "Inferno," is announced for immediate issue by D. C. Heath & Co. The "Paradiso" is also in preparation.

The Macmillan Company promises shortly: "The Ladies' Battle," an argument against woman suffrage, by Molly Elliot Seawell, and "World Literature," by Dr. Richard G. Moulton.

J. J. Bell has placed a new novel with Cassell & Co.

John Spargo is publishing with B. W. Huebsch "Sidelights on Contemporary Socialism."

Two new novels will be issued in April and May by the Century Co., Mary Dillon's "Miss Livingston's Companion," and "An Ardent American," by Mrs. Russell Codman.

Longmans, Green & Co. have been appointed agents for the sale in the United States of the publications of the University of Manchester.

In his series of California stories, Richard Badger is bringing out immediately "The Dawn Meadow," by Miss G. A. Dennen, and "Don Sagasto's Daughter," by Paul H. Blades.

J. B. Lippincott Co. announces: "From Memory's Shrine," reminiscences of Carmen Sylva, Queen of Roumania: "The Capitals of China," by William Edgar Geil; "A Short History of the United States Navy," by Capt. George R. Clark; "The Boy Scouts of Birch-Bark Island," by Rupert Sargent Holland.

In the list of Henry Holt & Co. are: "The Valley Captives," by R. Macaulay; "Household Administration: Its Place in the Higher Education of Woman," documents edited by Alice Ravenhill and Catherine J. Schiff; "Three Lays of Marie de France," a paraphrase by Prof. F. B. Luquiens, and Wildenbruch's "Kindertränen," edited by Dr. A. E. Vestling.

The publication of Lydgate's "Serpent of Division" (Henry Frowde, Oxford University Press) does not threaten to reverse the world's opinion of the Monk of Bury, but, in the light of Prof. Henry Noble MacCracken's scholarly introduction, this prose tract assumes not a little interest. Writing in 1422, apparently at the command of Duke Humphrey of Gloucester, then Lord Protector, Lydgate endeavors to illustrate the dangers of civil strife by recounting the life of Julius Cæsar. It was a time of general apprehension; Henry V had just died, and his heir was only nine months old; but Lydgate is too true to himself to be fired by the opportunity. He sets resolutely to work, collecting his materials, with scant eye to proportion, from the best authorities, and turns out what is, at any rate, the most extensive treatment of Julius Cæsar in Middle English, and one of the very earliest political pamphlets in English history. Even Lydgate's sources, which Professor MacCracken works out with care, are rather soberly matter of fact. In dealing with Julius Cæsar, the mediæval writers kept, on the whole, close to Lucan and Suetonius. The present text is based on the Fitzwilliam MS., supplemented by the Calthorpe MS.; the readings of the Pepys and the Harvard MSS. are collated throughout. The three full-page reproductions from contemporary manuscript illustrations are highly attractive.

Prof. John Livingston Lowes ("Chaucer and the 'Miroir de Mariage,'" Modern Philology, VIII, 2, 3) continues with great acuteness to identify the Old French materials which Chaucer, the "grand translateur," so thoroughly assimilated and which influenced him more extensively and more persistently than has generally been supposed. This time it is the "Miroir de Mariage," a twelve-thousand-line poem of Eustache Deschamps, which supplies Chaucer with a good deal of material for the discussion of marriage in the "Merchant's Tale," with more than one suggestion for the Wife of Bath, and with sundry bits that appear in the A-Prologue to the "Legend of Good Women," the "Miller's Prologue," and the "Franklin's Tale." Bound up in this discussion are important considerations of chronology and of the development of Chaucer's narrative art, which Professor Lowes intends to treat later more at large.

Tho march of civilization and the humanizing of manners are eloquently attested in the changed relations between authors and publishers. What the eighteenth century writers thought of their booksellers, and how the booksellers treated their writers, has become tradition. Even the gentle Elia grew venomous on the subject. When the great houses of Constable and Ballantyne went down in the financial panic of 1826, Lamb wrote to Wordsworth: "When Constable fell from heaven, and we all hoped Baldwin was next, I turned a slight stave to the words in 'Macbeth' (D'Avenant's), to be sung by a chorus of authors:

> "What should we do when Booksellers break?
> We should rejoyce."

And there is, of course, the famous letter to Bernard Barton: "Throw yourself on the world without any rational plan of support beyond what the chance employ of booksellers would afford you! ! ! Throw yourself, rather, my dear sir, from the steep Tarpeian rock, slap-dash headlong upon iron spikes. They are Turks and Tartars. Come not within their grasp." Yet in this same volume that chronicles the wrath of Lamb, and cites the famous anonymous epigram, "Now Barabbas was a publisher" —Frank A. Mumby's "The Romance of Bookselling" (Little, Brown & Co.)—we find the story of numerous hearty friendships between authors and publishers. Of Constable, over whose fall Lamb rejoiced, Scott wrote to Lockhart:

> While I live I shall regret the downfall of Constable, for never did there exist so intelligent and so liberal an establishment. They went too far when money was plenty, that is certain; yet, if every author in Britain had taxed himself half a year's income, he should have kept up the house which first broke in upon the monopoly of the London trade, and made letters what they now are.

Perhaps the classic type of the benevolent and wise publisher is George Smith of Smith, Elder & Company, the friend of Charlotte Brontë, Thackeray, George Henry Lewes, Harriet Martineau, Mrs. Gaskell, Anthony Trollope, Symonds, Matthew Arnold, the Brownings, and George Eliot.

Mr. Mumby touches on the ever-fresh subject of authors' earnings. While it is generally true that authorship before the nineteenth century did not "pay," every age has had its exceptions. Martial grumbled at the scant profits from his verses as compared with Horace's Sabine farm and Vergil's 10,000,000 sesterces. The Elizabethans were the victims of pirate publishers. Milton signed away the copyright of "Paradise Lost" for £5, with a further £5 at the end of the first, second, and third editions. Altogether, Mr. Mumby calculates Milton received what would be in present-day money about £63. But already Dryden receives £1,200 for his "Vergil" and £250 for the first edition of his fables. Estimates of Pope's profits from the "Iliad" range between £4,000 and £5,320. Johnson received for his "Dictionary" £1,575, for Rasselas £125, for his Shakespeare edition £1,300, for the "Lives of the Poets" 200 guineas—this because Johnson did not ask for more; the publishers stood ready to give 1,500 guineas. Among large author's payments in later days were Crabbe's £3,000 from John Murray for "Tales of the Hall"; Mrs. Strickland's £2,000 from Bentley for "Lives of the Queens"; Lord Lytton's £20,000 from Routledge for a ten years' right to issue cheap editions of his published works; Thomas Moore's £3,000 from Longmans for "Lalla Rookh"; Macaulay's £20,000 from Longmans for profits on the third and fourth volumes of his "History"; George Eliot's £10,000 from Smith, Elder & Co. for "Romola." For "Treasure Island" in book form Stevenson received, "how much do you suppose? Well, a hundred pounds, all alive O! A hundred jingling, tingling, golden, minted quid! Is not this wonderful?"

In the account which the London *Athenæum* gives of the exhibition, now open at the British Museum, of Bibles and documents illustrating the history of the English Bible, we note:

> The exhibition is in two parts, the first comprising the chief Biblical manuscripts of the Museum, including the Codex Alexandrinus, some early Hebrew and Latin codices, the Bosworth Psalter, and the famous Lindisfarne Gospels, one of the finest examples of Celtic art dating from

about 700 A. D. . . . The first case on the left contains a number of fifteenth-century Bibles printed in the vernacular, including German, Low German, Italian, Dutch, and Bohemian . . . illustrated Bibles, examples of which are the Low German Bible of 1480, the Italian one of 1493, the Malermi Bible, and the French Bible of 1510. A copy of Lyndewood's Provinciale is open at the decision of the Synod of Oxford in 1433 forbidding the circulation of the Bible in the vulgar tongue, with a note to the words "noviter compositus" pointing out that ancient versions were not forbidden, a point afterwards made by Sir Thomas More.

In the second case are several treasures:

The only known fragment of Tyndale's first New Testament, the printing of which was interrupted at Cologne in August, 1525; the only complete copy known of the second New Testament, printed at Worms in the same year; two copies of Tyndale's version of the Pentateuch, printed in 1530, and his translation of Jonah, printed before June, 1531. In the same case are shown Joye's unauthorized edition of Tyndale's New Testament of August, 1534; Tyndale's edition of November, 1534; Joye's second edition of January, 1535; and Tyndale's of 1535, Anne Boleyn's copy of the November, 1534, edition shown is on vellum. Of six reputed editions of the New Testament printed in 1526 no copy is known to exist, unless, indeed, the fragment in the Durham Cathedral Library prove to be one. The editions used by Tyndale—Erasmus's Latin-Greek New Testament and Luther's German version—are also shown.

The next case contains the first complete English Bible printed, that of Coverdale in 1535; Matthew's Bible of 1537, printed at the expense of Richard Grafton and Edward Whitchurch; Taverner's Bible of 1539, and two out of the three editions of the Vulgate with the English translation of Coverdale.

The next case contains:

Five out of the seven editions of Cranmer's Bible of 1540, together with the Royal Proclamation of May 6th, 1541, enforcing its use. The history of the popular Geneva version, of which first editions of the New Testament (1557) and the Bible (1560) are shown, is fully illustrated, and copies of the Bishops' Bible, the Rhemish New Testament, and the Douai Old Testament fill the next case. A folio edition of the Geneva version shows that it was used in churches for some years from 1578, and the last edition in folio, issued in 1644, fixes the date when it began to be superseded by the Authorized Version.

The cases devoted to the Authorized Version show:

The two versions of 1611 (the "He" Bible and the "She" Bible), the 1613 and 1617 editions, and the first quarto and octavo editions in 1611, while a last case contains some curiosities, such as the "Wicked" Bible of 1631, which omitted the "not" in the seventh commandment, and the "unrighteous" Bible of 1653, which printed 1 Cor. vi. 9 as "know ye not that the unrighteous shall inherit the kingdom of heaven." Some further revisions are shown, including the Cambridge ones of 1629 and 1638; Baskett's "Vinegar" Bible, which was called "a basket-ful of errors"; and an Amsterdam Bible of 1643, containing the text of the Authorized Version with the notes of the Geneva issue.

The cases devoted to documents affecting the history of the English Bible include:

The first mention of Tyndale's translation, in a letter of Lee to Henry VIII in December, 1525, from Bordeaux on his way to Spain. Lee had probably learnt of the printing of the Testament at Calais, where Roye, Tyndale's assistant, had friends and relations. Other items shown are the Bishop of Norwich's subscription to the fund for buying up Testaments to burn them, Monmouth's petition giving the history of his relations with Tyndale, Grafton's correspondence with Thomas Crumwell, licenses for printing the Great Bible, the Welsh Bible, and the Geneva Bible.

The director of the New York State Library for the Blind, which is operated as a division of the State Library at Albany, reports a collection of 3,000 volumes in raised letters, and a registry of 800 active blind borrowers. During the last twelve years 50,000 volumes have been borrowed by blind persons, an average of 17 issues for each volume in stock and of 60 loans to each borrower. The difficulty of enlarging the collection is pointed out in the fact that it costs $316 to print a single copy of such a work as Parkman's "Oregon Trail" and $230 for a copy of "Rebecca of Sunnybrook Farm," each of these works appearing in two mammoth volumes. A corresponding advantage in this high cost is noted in that only works of real worth and interest are thus available. Books which have had the largest circulation the last two years are "Tom Sawyer," borrowed 104 times; Lee's "Uncle William," 97 times; Hale's "Daily Bread," 91 times; Gaskell's "Cranford," 90 times; Andrew's "Perfect Tribute," 80 times; Wiggin's "New Chronicles of Rebecca," 64 times; Wister's "The Virginian," 61 times; Harker's "Miss Esperance and Mr. Wycherly," 54 times; Aldrich's "Selected Stories," 53 times; Taft's "Present-Day Problems," 36 times. By act of Congress in 1904 provision was made for the free carriage by mail of all books for the blind when sent from or to libraries, so all blind persons of the State have the free and equal use of this library, wherever they may reside.

"A Little Fifer's War Diary" (Syracuse, N. Y.: The Author), by C. W. Bardeen, is not an important contribution to our civil war literature. Mr. Bardeen was but thirteen at the firing on Sumter, and though he went through two strenuous years with the First Massachusetts, his diary is very meagre, as might be expected of such a child. Nor do the author's recollections help the matter much; for in great crises, as at Chancellorsville and Gettysburg, they are quite crowded aside by quotations from other participants, from privates up to corps commanders, whereby we lose the personal touch. The history is bad. For instance, it is well ascertained that Stonewall Jackson was wounded fatally by the fire of his own men, and not by Federal volleys, as Mr. Bardeen contends, and few students of the engagement will conclude that the honors of Gettysburg belong to Sickles, and not to Meade, as is here asserted. The illustrations are portraits, and the crude contemporary sketches of the pictorial newspapers, vivid enough surely, but for many years scattered broadcast, and easily accessible in more complete and better shape. In the correspondence relating to a pension, introduced to show the unreasonableness and inefficiency of the officials, the commissioner of pensions appears to much better advantage than Mr. Bardeen. Proper vigilance and system in the discharge of a most responsible and arduous duty ought not to be stigmatized as ridiculous red tape and stupidity.

"Yesterday and To-day in Canada" (London: G. Allen & Sons), by the Duke of Argyll, is one of the three opening volumes in a series of books on the British Empire. The Duke of Argyll, one time the Governor-General of the Dominion, retains an interest in all matters Canadian, and is eminently qualified to deal with his subject in a thoroughly informed manner. He refers in an impartial way to the race problem of Canada, which continues to persist as a fundamental problem in the face of passing decades. The author devotes a chapter of general information to each province of Canada except diminutive Prince Edward Island. Attention is directed then to such timely and pertinent questions as the naval and military defence, the development of transportation facilities, and the meeting of colonial ministers in London. In the chapter on the defence issue an account is given of the naval debates in the Canadian Parliament during the early part of 1910. Douhtless the most interesting chapter, to Americans as well as Canadians, is that entitled National Highways of Canada. The author describes the growth and present condition of the Canadian Pacific Railway, the Grand Trunk Pacific Railway, and other lines in the country. He goes into detail, in respect to the Grand Trunk Pacific, and presents statistics showing the immense advantage of low and easy gradients, which this line, now in process of construction, is to have over the Great Northern, Union Pacific, and other lines across the continent. In later chapters, attention is directed to Canada's relations with the United States. He endeavors to show that the prevalent notion that England has wantonly sacrificed Canadian interests on several occasions is not based on fact. He discusses the Elgin-Marcy reciprocity treaty of 1854-66, the Alaska boundary controversy, the Newfoundland fisheries question, and many other matters having to do with the relations between Canada and her great Southern neighbor. This leads the author naturally to his pet subject—Imperial federation.

"Corpus Nummorum Italicorum" is the title of a catalogue of mediæval and modern coins, struck in Italy or by Italians abroad, which is in preparation by the firm of Savoie in Milan; the first volume of the ten which are planned is now ready. The work is based chiefly upon the collection of the King, who, from childhood, has been devoted to the subject.

"Aus meinem Leben," Erster Teil, by A. Bebel (Stuttgart: J. H. W. Dietz), is an unusually interesting contribution to modern history by the alert leader of Social Democracy in Germany. Bebel's account of his humble youth and of the development of his political and economic theories is all the more valuable because written in an exceptionally calm and objective way. Among the most interesting features of this work are the author's personal accounts of such history-makers as Bismarck, Lassalle, E. Richter, Liebknecht. The book is a fine literary exponent of modern Social Democracy which incites to thought even where it provokes opposition.

The new German edition of Falk and Torp's Etymological Dano-Norwegian Dictionary (Norwegisch-dänisches etymologisches Wörterbuch, mit Unterstützung der Verfasser fortgeführte deutsche Bearbeitung von Hermann Davidsen; Heidelberg: C. Winter, 1907-1911) is now complete. Its advantages over the older edition (published in Christiania, 1903-1906), which it follows after so brief an interval, are : (1) That all explanatory matter is in German,

which will make it accessible to many students of etymological problems to whom the original Dano-Norwegian text presented no inconsiderable difficulty; (2) that it has undergone thorough revision, involving numerous corrections and the addition of no little supplementary matter. Especially welcome in this connection are the "Literaturangaben und Nachträge" (pp. 1425-1582), with references to the diverging opinions of other etymologists; (3) that indices of Old Norse and German words are included, the first edition having indexed only Norwegian dialect-words. The work with its treatment of numerous High and Low German loan-words and cognates is an invaluable supplement to Kluge's Etymological German Dictionary, which in its last edition (1910) has emphasized more especially the historical development within the modern High German literary language. The philological world owes a debt of gratitude to the publisher of the new Falk and Torp for the rapidly progressing realization of his plan of an extensive series of grammatical and lexicographical works, and not least for an admirable new periodical devoted to etymological-archæological research (*Wörter und Sachen*, 1909 —).

From time to time there appear books undertaking to trace all religious ideas to some point in the remote past. Some of these works (like those of Winckler and Jensen carrying back all myths to Babylonia) have the semblance if not the reality of scientific method; others have not even the semblance of such a method. In the latter class must be placed Dr. Albert Churchward's "Signs and Symbols of Primordial Man, being an explanation of the evolution of religious doctrines from the eschatology of the ancient Egyptians" (Dutton). The author's main interest appears to be in the history of masonry, signs of which he finds in Central America, Assyria, and elsewhere, all going back to Egypt—a genealogy by no means necessary in order to establish the worth of this venerable institution. From Egypt he derives the word "totem," supposed by most scholars to be of North American origin; "American," however, for Dr. Churchward, would be ultimately "Egyptian." The oldest speech of man he holds to be that of the African pygmies, and it, he says, is identical with old-Egyptian; he gives a list of words to prove this identity. From Egypt, according to his scheme, came the code of Hammurabi; Moses was a priest of the Solar Eschatology of the Egyptians and knew that this was brought on from the Stellar; and the Jewish religion is founded on the Mysteries of the double horizon of Ra Harmachis—the Hebrew Pentateuch is based on an Egyptian collection of four books (probably the present arrangement in five books came about in the process of translation into Hebrew); the Brahmanic, Buddhist, and Persian religions are of Egyptian origin; the Great Pyramid, having been built in the period of the Stellar Myths, must be more than 15,000 years old. With such material as this the author fills over four hundred pages. One section of his book that might be of value is his account of the pygmies, in which he gives measurements of individual men and women; but from these prosaic details he passes quickly to an imaginative description of their "spirit-houses" and their cult of a Supreme Being.

The Rev. Dr. William Walker, whose death is announced from England, at the age of ninety-four, wrote a notable life of the Rev. John Skinner, the author of "Tullochgorum."

Prof. Henry Mitchell Whitney, one of four brothers who had attained distinction as scholars and educators, died suddenly on Saturday at New Haven, Conn. He was born sixty-eight years ago in Northampton, Mass., and served in the civil war, being sergeant-major of the Fifty-second Massachusetts Volunteers in 1862-3. In 1864 he graduated from Yale, and four years later from the Andover Theological Seminary. He wrote in collaboration: "Columbian History of Education in Wisconsin," "History of the Fifty-second Massachusetts Regiment," and "Twentieth Century New Testament."

The Rev. Dr. Edward Payson Crowell, professor emeritus of Latin language and literature at Amherst College, and the author of numerous Latin works, died at his home in Amherst, Mass., on Saturday, at the age of eighty. He retired in 1908 on a Carnegie pension, after a service of fifty years. From 1880 to 1894 he served as dean of Amherst. More than twenty years ago he lost the sight of both eyes, but continued his work as professor. Dr. Crowell was a graduate of Amherst in 1853, and in 1859 was licensed as a Congregational preacher. He began teaching at Williston Seminary, Easthampton, Mass., in 1853, and soon after joined the Amherst faculty. He was editor of a large number of Latin text-books, and became known as one of the leading men in his branch in the country.

Science

Under the Open Sky: Being a Year with Nature. By Samuel Christian Schmucker. With illustrations by Katherine Elizabeth Schmucker. Philadelphia: J. B. Lippincott Co. $1.50 net.

Birds of the Loch and Mountain. By Seton P. Gordon. New York: Cassell & Co.

The style of Mr. Schmucker's book is usually direct and not without a certain literary grace, while his descriptions generally are lucid and sometimes really graphic. The slight flaws in his literary technique are, indeed, easily forgiven in the evidence that he is not only a sincere lover of nature, but an accurate and thoughtful observer. He seems to appreciate, too, the difference between the merely curious and the significant. For example, the description of the mole is a capital bit of natural history writing in a popular vein. Again, in his second chapter, The Great Spring Rush, Mr. Schmucker discusses in a manner which is bound to hold the attention that most interesting natural process, the flow of the sap; the limitations of our knowledge prompt him to say that "not any, nor all of these [theories] put together, seem enough to account for this work of bearing the life-giving stream up the stem," and that "we are still waiting for the master mind who shall fathom the forces which work so silently." He has also expressed clearly and well that remarkable botanical hypothesis—apparently as plausible as poetic—that our dearly-loved arbutus is a cousin (if not a nearer relative) of the very similar Japanese plant; that they had a common ancestor in the northern parts of Asia and America, and that they were separated, during the glacial period, by the great ice-cap which forced one branch of the ancestral plant down through Eastern Asia and the other through Eastern North America, whence, having become somewhat varied from the parent stock by different surroundings, the plants are now moving slowly northward again, apparently with no fear of the "yellow peril" in the heart of the American flower.

It is a little surprising that so good an observer as Mr. Schmucker should say, in discussing the blackbird's peculiarity of walking, that "most of our common birds that fly well, walk indifferently, and are apt to hop along the ground, lifting both feet at once," inasmuch as the crow, the red-winged blackbird, the cow-bird, the starling (now virtually Americanized), the meadow-lark, the oven-bird, the water-thrush, and the Louisiana water-thrush (not to mention the herons), all of them good fliers, are also good *walkers;* while perhaps our best-known bird, the robin, a strong and skilful flier, neither walks nor hops, but *runs.* We must take issue, also, with the author when he characterizes the woodchuck as "stupid"; he is far from that, as is proved by the mere fact of his continued existence even when he is hemmed in on all sides and at short range by his mortal enemy, man; and it may fairly be doubted also whether squirrels actually make very effective use of their bushy tails in guiding their leaps from tree to tree.

On the other hand, there are accurate observation and correct deduction in the account of that wonderful little creature, the humming-bird; and many other subjects (taken up with a charming disregard for the relation of one to another, excepting a purely seasonal one), such as the development of the "June-bug," the growth and nature of the strawberry, and the "run of the shad," receive intelligent and readable discussion.

The illustrations should not get off scot-free. The frontispiece is an incorrectly colored picture of a meadow lark in quite impossible surroundings, and the full-page drawings are almost equally at fault, especially those of the blackbird, the Baltimore oriole, the wood pewee (which is wholly unrecognizable), and the kingfisher. Unfavorable impressions are greatly lessened, however, by the graceful marginal illustrations—

jack-in-the-pulpit, the skunk-cabbage, apple blossoms, white clover, etc.

Mr. Gordon's "Birds of the Loch and Mountain" is a well-written book about the birds of a part of Scotland. It includes the golden eagle, red grouse, capercailzie, ptarmigan, woodcock, goosander, golden plover, curlew, sandpiper, redshank, oyster catcher, common tern, common and black-headed gulls, water ousel, bullfinch, meadow pipit, willow warbler, and peregrine falcon. The text shows that the author is a careful and sympathetic observer; it contains much first-rate ornithology which will interest the student of bird-life, even though he has no personal knowledge of the birds described. The account of the ptarmigan is especially interesting because of the opportunity it gives for comparing that bird's habits and appearance with those of its American analogues, of which there appear to be four distinct species. The Scotch bird apparently is as prompt and as prudent as the American about changing its clothes (from ground colors in the summer months to nearly pure white when its mountain haunts are snow-clad); some of these costumes Mr. Gordon shows by skilful photographs. Evidently, however, he has not succeeded in catching the bird in its white plumage, as J. Alden Loring contrived to do in Alaska in 1901, when he procured a picture of a white ptarmigan on bare ground, which reveals in a striking manner the fact that even in such surroundings the bird's plumage gives it considerable protection by reflecting the ground tints, and thus partly concealing nearly half of its body. Many of Mr. Gordon's other photographs (there are ninety-odd) are noteworthy additions to nature photography, the picture of the bullfinch brooding being remarkably lifelike.

A Congress of Technology, which will give in the papers to be presented a record of the place and practical achievements of science in modern life, will be held in the buildings of the Massachusetts Institute of Technology in Boston on April 10 and 11. The sessions will be open to the public.

To his fascinating "Astronomy With an Opera Glass," his delightful "Pleasures of the Telescope," his by no means dry "Other Worlds," his untechnical "Moon," and his captivating "Curiosities of the Sky," Garrett P. Serviss has now added "Round the Year With the Stars" (Harper), in which he sets forth the chief beauties of the heavens as seen with the naked eye. His advice is practical, and the charts are well adapted to the beginner's needs, having plain instructions how to use them to advantage. The patient reader soon finds that less effort is needed in acquiring familiarity with the aspects of the sky than in attaining the fundamentals of geology, botany, or other natural sciences. Mr. Serviss commends highly the use of a mirror and study of the asterisms by reflection. Certainly it is an important convenience in studying circumzenith constellations, and is the same in principle as the little, but very comfortable device of the Vatican Palace for the study of the pictures by Michael Angelo on the ceiling of the Sistine Chapel. The rubricated constellation names seem to us a mistake, because in yellowish artificial light they are almost impossible to decipher; a tissue interleaf would have been much better, with no names whatever on the charts proper.

Edward W. Branigan, professor of clinical dentistry, and acting dean of Tufts College Dental School, died a week ago at the Charlesgate Hospital in Boston, aged fifty-three. Last year he was president of the National Association of Dental Faculties; he was the author of many works on dental subjects.

Dr. Edward F. Ashley, the bacteriological expert on the quarantine staff of Dr. Alvah H. Doty, health officer of the port of New York, died last week in the hospital on Swinburne Island, of malignant spinal meningitis, which he had contracted in the course of his work against that disease. Dr. Ashley was thirty-five years of age. He was a graduate of Yale, and of the College of Physicians and Surgeons of this city, and practised several years in the City Hospital. He thought that there was a greater future in bacteriology than in any other branch of his profession, and did not take up general practice.

Drama

The Doctor's Dilemma, Getting Married, and The Shewing-up of Blanco Posnet. By Bernard Shaw. New York: Brentano's. $1.50 net.

Disraeli's phrase, "A sophistical rhetorician intoxicated with the exuberance of his own verbosity"—no more than an insolent gibe when flung at Mr. Gladstone—acquires the force of a scientific definition when applied to Bernard Shaw, the author of this bulky, pretentious, and exasperating book. Mr. Shaw, of course, is much more than a mere rhetorician. He is an extraordinarily clever and highly accomplished man, plentifully endowed with wit and a rare mastery of grotesque humor, and a literary facility which enables him to exhibit his varied acquirements in glittering and attractive form, but his intellectual powers are made virtually inoperative by his congenital incapacity for or deliberate rejection of logical thought, and the monstrous egotism which leads him to seek notoriety by the means of paradox and audacious misrepresentation. It is a melancholy thing to see such gifts, which might have constituted the full equipment of a great and inspiring satirist, employed for ignoble or futile purpose. There is almost always a residuum of fact at the bottom of his most frothy and disingenuous deliverances, and it is this that might make them mischievous if they were more widely circulated. To the intelligent reader, who goes to them for mere entertainment, they will long be a source of rich and comparatively harmless enjoyment.

All his characteristic literary vices and shortcomings are illustrated copiously in this present volume, made up of three plays—which are negligible so far as any actual dramatic value in them is concerned—and sundry prefaces of inordinate length which are supposed, presumably, to be entire justifications of the conditions, theories, and personages exploited in the dramas. "The Doctor's Dilemma"—the nature of the dilemma need not be specified here—is one long tirade against the medical profession. The supposed indictment is fortified by reckless misstatement, gross exaggeration, unscrupulous special pleading, suppression of the truth, malicious suggestion, and dogmatic assertion. Occasional instances of maltreatment are quoted as general examples. A quasi-scientific gloss is imparted to fluent nonsense by the use of technical phraseology. In his preface he coolly writes: "I deal with the subject as an economist, a politician, and a citizen, exercising my common sense," common sense being the one quality of which his fallacious illustrations are conspicuously devoid. He does not explain why an economist or a politician should be an infallible judge of medical ethics, practice, and ability. Never were methods more unscientific than those which he employs. Unfortunately the adroitness of his whimsical humor often distracts attention from his own malpractice. He does not always talk pernicious rubbish. His advocacy of sunshine and soap, for instance, as sanitary agents, is perfectly sound. But his wise edicts are mere platitudes. Some of his conclusions are indisputable, but when he points out the way to reform he shatters his pretence of being an economist. He ruins his case by his unjust perversity, dishonesty, and egotism. But his humorous caricatures of different types of physicians and surgeons are delicious, as is his possibly unintended exposure of the humbug of the so-called "artistic temperament" in the person of the fascinating rascal Dubedat. Mr. Shaw knows something about shams.

There is much clever characterization, too, together with some that is impossible and inhuman, in his "Getting Married," which proceeds from comedy to farce and from farce to sheer burlesque. It is amusing and often brilliant in its insincere way, but nothing need be said about the story, which is absurd and dramatically worthless. With its voluminous preface it embodies Mr. Shaw's various notions about the estate of matrimony and the iniquity of British laws concerning it. The subject is one that is daily exacting more and more public attention and offers many opportunities for effective at-

tack. But here again Mr. Shaw ruins his case by his violence, his exaggerations, his cheap cynicism, and his substantial ignorance. He would reform the institution, apparently, by abolishing it altogether, although he admits that wise folk must endure it for the present. The average married man he describes—in what society he formed his ideas is a mystery—as a monster of selfish and brutal sexual depravity, and compares him with a balloon that has lost the lifting power of gas. Evidently he himself has escaped, as yet, that calamity. He admits that his speculations on the aspect of domestic life are necessarily unsupported by evidence, but does not suspect, seemingly, that their value may be affected by this coincidence. In pouring contempt upon the motives of marriage he flouts nature as well as law. Divorce, he maintains, should be had for the asking, and for any cause rather than that of infidelity. The religious side of marriage naturally excites his fiercest scorn, which betrays him into confusing the principles of Christianity with dogmas of the early and mediæval churches. In conclusion —by way of putting the cap on the pinnacle of his wisdom—he remarks that the remedy for all the social evils which he has been depicting is perfectly simple, being nothing more nor less than the provision of the means of independent livelihood for women. This is a sample of his grasp of economic problems. Of course, he does not offer any solution of this one.

He devotes seventy-five pages to an account of his adventures with the Lord Chamberlain's office in connection with the refusal of a license for the public presentation of his play, "The Shewing-up of Blanco Posnet." Somewhat too much space in the press has been devoted already to that incident. On reading this piece a cynic might be tempted to suspect that Mr. Shaw—who has often shown himself keenly alive to all the advantages of advertisement—deliberately inserted certain passages to make the refusal of a license absolutely certain. However this may be, the British stage has lost nothing by the suppression of this crude specimen of alternately coarse and sentimental frontier melodrama. The piece belongs to no higher dramatic category. Its incidents, its characters, and its atmosphere are all equally theatrical and untrue. The dialogue, of course, is enlivened occasionally by flashes of the author's peculiar smartness, which, however, are generally inappropriate to the scene. But no consideration of this kind influences Mr. Shaw, who rarely permits reason, probability, or fact to interfere with the exercise of his sardonic humor, his irresponsible wit, or his faculty for distortion. The result is that he has produced a bulky volume which is worthless except as a demonstration of the futility of genius when it is not allied with sanity.

English Dramatic Companies, 1558-1642. By John Tucker Murray, 2 vols. Boston: Houghton Mifflin Co. $7.50.

Fleay's "History of the Stage, 1559-1642" may be said to have marked an epoch in the study of the Elizabethan drama, but, apart from the disadvantages that would naturally attach to any work in a field in which so few had labored, the book was often seriously marred by the author's tendency to rash speculation. Moreover, Fleay purposely ignored the provincial companies. There was accordingly great need of a new history, and with this Mr. Murray has supplied us in an eminently satisfactory manner. As explained in the Preface, the work was originally begun as a Harvard thesis on the provincial companies, and it is still most notable for the flood of light which it throws on their history and activity; but the writer was gradually led to embrace the London stage also, and as the final result we have the first volume devoted to the London and the second to the provincial companies. How great the number of the latter was appears for the first time in this work; the interest of Elizabethan England in the drama seems to have extended to every part of the kingdom.

Mr. Murray very wisely does not follow Fleay's plan of discussing stage history according to periods. He takes up the individual companies in succession and relates separately the whole history of each, before beginning with another. Furthermore, at the end of the history of each company a list of all recorded court performances and provincial visits of the particular company is given. In the first volume, where he traverses the ground covered by Fleay's treatise, he has the advantage of reviewing the work of his predecessor, and we may add also of a soberer judgment, so that he is able to supply corrections on almost every page. The notes of this volume are full of such corrections, while certain of Fleay's more important errors are handled in appendices. Especially notable among the appendices of this nature are those which deal with the history of the Earl of Pembroke's company, the question of the great actor Alleyn's later connection with the stage (which, contrary to Fleay's supposition, he seems not to have abandoned until 1604), and the relation of the plague to the closing of the theatres, 1558-1642. The evidence shows clearly that in the period most in dispute, namely, from about 1608 on, the theatres were closed when the weekly deaths from the plague exceeded forty. A table of deaths for the years 1563-1642 (with no breaks between 1605-1642) is included.

We have already noted the great value of this work for the history of the provincial companies. The final appendix, which makes up more than half of the second volume, is a collection of notices drawn from local histories, the publications of the Historical Manuscripts Commission, and the records themselves, especially the account books, mayors' court books, and letter-books of the various corporations, the records of Norwich proving particularly fruitful. A great number of companies are unearthed whose existence had not been previously suspected. In this connection it is singular to find the citizens of Kendal as late as 1586 still clamoring for the old Corpus Christi (miracle) plays.

As far as we have observed, the work is remarkably free from inaccuracies. The new patent, however, granted Prince Henry's players (see I, 208) was not dated (April 30), 1607, but 1606. Mr. Murray is here, no doubt, following the transcript of the Patent Roll printed in the "Shakespeare Society's Papers" (1849), but the original license with correct dating is given in the company licenses, quite recently edited for the Malone Society by E. K. Chambers and W. W. Greg. A few of the fourteen licenses printed by these scholars are new and contain details of interest for the history of individual companies. Furthermore, Mr. Murray does not seem to have been aware of the important documents relating to the Fortune and Red Bull Theatres printed by Dr. C. W. Wallace in the University of Nebraska Studies (1909). Perhaps, like the licenses, they were published too late for use in his book. As appears from them, the Red Bull Theatre was already in existence by 1605. Among other things, they contain interesting material regarding a law-suit between the actor Alleyn and a brother of the theatre-manager Henslowe, and give the only information we possess as to the compensation of the Elizabethan "gatherer" (that is, the man who took in the money at the door), which, according to Dr. Wallace, was one-eighteenth of the total receipts. In another matter, of very slight importance to be sure, Mr. Murray accepts the current view that Shakespeare and other actors followed King James in the royal procession on March 15, 1604. Ernest Law, however, in his "Shakespeare as a Groom of the Chamber" (published about the same time as the present work) has shown convincingly that the King's gift of red cloth on this occasion did not necessarily imply any such thing.

In conclusion, we recommend heartily this excellent treatise, which, we are sure, will take its place at once as the most trustworthy authority in its field.

Hauptmann's drama, "The Weavers," is

to be republished this season by B. W. Huebsch.

Granville Barker has arranged with Mitchell Kennerley for American publication of all his work; the first volume will be "Three Plays," containing "Waste," "The Marrying of Ann Leete," and "The Voysey Inheritance."

Matheson Lang and his wife, Hutin Britton, have made arrangements for a prolonged tour in South Africa.

Irene Vanbrugh has been engaged as leading lady of Frank Curzon and Gerald du Maurier for their managerial alliance at Wyndham's Theatre, London. She will play the leading female character in Haddon Chambers's new piece, "Passers-by," now ready for production. This is said to be something entirely different from any of the author's preceding plays. It is in four acts, of light texture, and tells a story of modern London life. Mr. Du Maurier has a young man's character. Miss Vanbrugh's part, on the other hand, is said to be of a different type from any that she has yet played.

At the London Lyceum Theatre on the afternoon of April 4, the eve of the poet's birthday, Elsie Fogerty's company will give a commemoration matinée performance of Swinburne's "Atalanta in Calydon" in aid of the funds of the Poetry Society. Miss Fogerty's original performance in the part of Althæa and Muriel Elliot's music have been highly praised by English critics.

The Oxford University Press (Frowde) is engaged in issuing "The Complete Works of William Shakespeare," three of the proposed nine volumes having already appeared. The general introduction, written by Swinburne, was evidently chosen for its commercial value rather than for any profit to the reader. With the panegyric of one poet by another poet no one need quarrel; it may, besides, be highly suggestive. But in this instance, mixed in with pure lyric outpourings, there are statements which pass on old errors of fact and judgment, and an individual bias of the critic which will perhaps deceive no scholar, but is likely to deceive many for whom the edition is planned. For this, we are informed in a few pages by Mr. Watts-Dunton, is designed to be an open-air Shakespeare. To make the idea seem less fanciful, we are let into a secret:

It is a singular fact in regard to the king of dramatists that, although his representations of life were written to be acted, the most delightful way of enjoying them is not to see them on the stage—where, too often, the obtrusive personality of the actor blurs or is mingled with Shakespeare's own vision of the character—nor even to study them in the closet, but to read them in the open air, along the banks of a river—the Avon, say, or the Ouse, or the Upper Thames—or under the wavering shadows of English trees, with the music of the summer birds and the distant bleat of the sheep lending an accompaniment to the music of the poet's verse.

If an open-air edition is perfect, each page will "pass into the reader's soul with no more suggestion of printer's ink than the hymn of skylark overhead." So the italics, which usually mark the stage-directions, have here been replaced by Roman letters: "the sunlight filtering through the leaves upon the page is apt to dazzle and vex the eyes by accentuating the lack of harmony between perpendicular and oblique lines." For the same reason not a note can be found, either with the text—that of the Oxford edition—or after it. Introductions excepted, among which should be mentioned preliminary notices of the individual plays by Professor Dowden, there is nothing to distract the song of soul or bird—save the publisher's advertisement of 168 books and 2 bookcases. Despite their perfection, the volumes look as though they would be pleasant to use. Vol. I contains "The Tempest," "The Two Gentlemen of Verona," "The Merry Wives of Windsor," and "Measure for Measure"; Vol. II, "The Comedy of Errors," "Much Ado About Nothing," "Love's Labour's Lost," "A Midsummer Night's Dream," and "The Merchant of Venice"; Vol. III, "As You Like It"; "The Taming of the Shrew," "All's Well that Ends Well," "Twelfth Night," and "The Winter's Tale."

The first of the series of four lectures, with histrionic illustrations, upon the development of the English drama, which Brander Matthews is delivering in the New Theatre, attracted an enormous audience. It is evident that the public interest in the theatre is deep and widespread. Mr. Matthews, of course, can only touch upon the outskirts of his subject in the brief space allotted to him. Speaking on the ancient miracle and mystery plays and the moralities which grew out of them, he briefly demonstrated their ecclesiastical origins and traced the process—of which we do not know much—by which they gradually became secularized. His explanation was as clear as it could be made in the circumstances, and was fortified by several apt illustrations, but was necessarily elementary in character. Nevertheless, it was received with eager attention by the audience, in which the student element was conspicuous. The acted examples were "Noah's Flood," one of the Chester series of mysteries, with a few interpolations from another source, and "Nice Wanton," a morality of about the middle of the sixteenth century. The first was acted in a two-storied wheeled ark, which was dragged upon the scene, the market place of old Windsor, by the performers. The stage and its appurtenances were sufficiently accurate, and in many respects the conditions of the time were reproduced faithfully, but it was possible to question some features of the performance. For instance, the face, hair, and beard of the actor who played Dominus were gilded. The effect was ingenious and striking, but it is doubtful whether such an expedient would be within the resources of the poorer strollers. The whole equipment of the actors, indeed, seemed too new and prosperous. Another point to be raised lies in the disparity between the players themselves, the artistic dignity and the elocutionary power and skill displayed by the Dominus and the Noah, and the frankly bucolic extravagances indulged in by Noah's wife and other comic characters. The fact is that we do not and cannot know just how these pieces were presented. For "Nice Wanton" the actors built their stage upon trestles. The piece is of small account, but the performance was excellent and carried more of illusion than might have been expected. This was because the individual players were more in earnest. On the whole, the New Theatre is to be congratulated upon the success of its experiment.

Music

"ARIANE AND BLUE BEARD."

Either the attitude of the public has changed, or that astute Maurice Grau was wrong in holding that it does not pay to produce new operas in New York or in the other cities of this country. Andreas Dippel has found in Chicago and Philadelphia a strong desire for operatic novelties, and within the last few weeks he has also given New Yorkers a chance to hear two new scores—Victor Herbert's "Natoma" and Wolf-Ferrari's "Le Secret de Suzanne"—both of which were favorably received. Next Tuesday he will produce still another work never heard here, Jean Nougues's "Quo Vadis," based on Sienkiewicz's famous novel; and this, it is promised, is to be the most elaborate operatic spectacle ever witnessed in a New York opera house. Mr. Gatti-Casazza, on his part, has staged Puccini's "Girl of the Golden West" and Humperdinck's "Königskinder," each of which will have had nearly, if not quite, a dozen representations by the end of the season—a record exceeded only once before, when Emma Calvé first came over to act and sing "Carmen," which she sang fourteen times in one "stagione."

To the works of Puccini and Humperdinck the manager of the Metropolitan has now added Paul Dukas's "Ariane et Barbe-Bleue." This, however, though new to America, is not, like the two operas just referred to, an absolute novelty, having been produced in Paris, at the Opéra-Comique on May 10, 1907. The prima donna, on that occasion, was Mme. Leblanc, the wife of Maeterlinck, of whose play this opera is a setting; she did not, according to common report, make the most of her opportunities; but the scenic attire was beautiful and the play and music appealed to the thousands of admirers of Maeterlinck's mystic conceptions, wherefore the opera was pronounced a success. It was also produced in Brussels and in Vienna. The story of Blue Beard has been repeatedly set to music by Grétry (in his "Raoul"), Offenbach, who burlesqued the story, and several others. In Maeterlinck's play, Blue Beard is not the monster of the original French legend, who murdered five wives in succession for the reason that, in his absence, they had used the golden key to open the forbidden chamber of horrors, while the seventh wife was saved at the critical moment by her brothers, who slay Blue Beard. In the latest Parisian version, Blue Beard gives each of his five successive wives seven keys, one golden, the others silver, with permission to use only the silver keys. They all disobey, sooner or later, and disappear mysteriously. Rumors of murder are current among the peasants, whose voices, when the curtain parts, are heard warning

Ariane, the sixth bride, just arriving in a carriage, not to enter the dangerous castle. What the audience beholds is a scene in the interior of the castle, a large hall, semi-circular in form, with three small doors with silver locks on each side. Ariane, with her nurse, enters the hall; she has in her hand the seven keys; the one of gold alone interests her; the others she throws away. The nurse picks them up, and unlocks the first door—whereupon a cascade of amethysts falls upon the floor—rings, bracelets, diadems, and other ornaments. The same results follow the unlocking of the other doors, except that the jewels are different—sapphires next, followed by pearls, emeralds, rubies, diamonds. Though dazzled by all this splendor, Ariane continues to search for the golden lock; at last she finds it, inserts her key, and, when the door opens, a stifled distant chant comes up from the depths —the chant of the five imprisoned wives. At this moment Blue Beard enters and tries to drag Ariane away. The cries of the nurse attract the peasants; she draws the bolts and they come tumbling in. Blue Beard draws his sword, but Ariane sends the peasants away with the words: "What do you want? He has not harmed me."

The scene of the second act is one of the dark underground halls dear to Maeterlinck. Ariane and the nurse descend, lamps in hand. They come across the discarded wives, huddled together. Ariane embraces them, and urges them to follow her out of the dungeon to the sunlight and flowers above. A pale green light serves as guide; it comes through a glass skylight which the five wives think keeps out the sea water; but Ariane takes a stone, and smashes the glass, whereupon they emerge joyously into the garden bordering on the sea. In the last act we see the rescued wives in the semi-circular hall, where the jewels are still sparkling on the floor. Encouraged and instructed by Ariane, they adorn themselves so as to show off each one's peculiar beauty to best advantage. The nurse creates alarm by announcing that Blue Beard is returning. But the peasants, armed, are watching for him; there is a fight; they bring him in, bound, and place him on the sofa. Ariane bids them go back to the village and dress their wounds. When she turns her head she sees the five wives on their knees gazing on Blue Beard with adoring miens. She cuts the ropes that tie him; she bids him good-by, and asks the wives to follow her; but they refuse to leave him. His own eyes are fixed on her retreating form.

It has been surmised that Maeterlinck, noting how much more effective his "Pelléas et Melisande" is with Debussy's music than without it, deliberately wrote his "Ariane et Barbe Bleue" as a libretto. It certainly seems too slight and fantastic to be effective as a play, but for a musical setting it is admirably adapted, and it may be said at once that Paul Dukas has made good use of his opportunities. Reports had come from Paris that he had outdone Debussy; but that is not so. There are, it is true, a number of places where the harmonic—or rather dissonantal—progressions that are now the fashion in Paris are used, but there is quite as much of Wagner in this score, and the best things in it are Dukas's own. He had previously shown in his orchestral scherzo, "The Sorcerer's Apprentice" (which has become a favorite in our concert halls) that he is a composer with a personality; and this impression is strengthened by his opera.

What distinguishes it most favorably from "Pelléas et Melisande" is that it contains real melodies and dynamic contrasts. Some of the leading themes are so individual that they impress themselves on the memory at once and become more effective with each successive hearing. One wishes that more of this melody were assigned to the singers; but in confiding it chiefly to the orchestra Dukas was simply following the example of other composers of the period. It is a fashion which must have its day; some future Bizet will end it. Ariane's diamond air is the nearest approach to the set numbers of opera as it used to be; for the rest, the vocal parts are a sort of intervallic declamation or recitative, less monotonous than Debussy's, yet seldom expanding to sustained melody. The advantage of this method of writing for the voice is that it enables the singer to enunciate distinctly; it enforces the principle, first followed by Peri and restated by Gluck and Wagner, that "the play's the thing." Its disadvantages are partly overcome by the orchestra, which in "Ariane" nearly always has something to say. There are several superb and genuinely dramatic (not merely operatic) climaxes; six of them in quick succession after the doors are opened that had hidden the jewels —each orchestral outburst being differently colored, like the jewels themselves; but the grandest of them occur where they are most needed—at the close of the different acts. The exultant strains heard when the liberated women gambol in the flower garden are among the most exhilarating things in modern opera. Of musical "atmosphere" there is an abundance throughout the opera, the most striking instance being the subdued moaning chorus of the imprisoned women in the first act after Ariane has used her golden key.

"Ariane" is almost as much of a "prima donna" opera as "Lucia," though in a different way. On Geraldine Farrar rests the chief burden of the opera so far as the stage is concerned. She is, fortunately, as accomplished an actress as she is a singer, else it would have been foolish for her to essay the part of Ariane. At the dress rehearsal, on which these comments are based, she fascinated the invited audience, winning much applause for her skill in assimilating a style of music to which she had heretofore been unaccustomed. She shared the honors with Mr. Toscanini, who demonstrated on this occasion that he can interpret a Parisian opera of the hour as sympathetically as the Wagner, Verdi, and Puccini operas that have made him famous.

After nearly forty years of secret existence, the autobiography of Richard Wagner is to be published this year by Dodd, Mead & Co. In one striking incident he relates how he was summoned from school to the bedside of his dying father, for whom he was asked to play. He did so, and the father whispered, "I wonder whether he will ever develop a talent for music."

Art

Répertoire de Reliefs Grecs et Romains. Tome Premier, "Les Ensembles." By Salomon Reinach: Paris: Ernest Leroux.

In bringing out this volume of reproductions of Greek and Roman reliefs M. Reinach has again earned the gratitude of students of ancient art. Every archæologist is familiar through constant use with Reinach's "Répertoire de la statuaire grecque et romaine" (3 volumes), and his "Répertoire des vases grecs et étrusques" (2 volumes). A work of a similar nature on Greek and Roman reliefs has been looked forward to since the promise of its publication eleven years ago. Its appearance therefore is welcome news, though this is only the first of the two volumes expected, and there seems to be no immediate prospect for the publication of the second.

The present book is entitled "Les Ensembles," that is, it contains reliefs with groups of figures which either formed part of the decorations of ancient buildings, such as metopes, friezes, and pediments, or ornamented smaller objects, such as metal vases. It is not the author's intention to reproduce all known reliefs of this nature; but a selection of the more important works is given, arranged in chronological order according to the places in which they were found. Thus, the sculptures from Delphi, from Ephesos, Assos, Phigalia, Trysa, etc., as well as the reliefs from the various arches and columns of Rome, which hitherto could only be studied in bulky, expensive editions, often difficult to obtain, are here faithfully reproduced side by side. As M. Reinach proudly says in his preface, the works published in this volume could before only be found scattered in seventy-three publications,

costing about $600. Of course, the reproductions in M. Reinach's book do not pretend in any way to have artistic merit. They are mere records in black and white of the compositions of the groups, without any indication of detailed work, but for reference they will be invaluable. The text which accompanies them is reduced to a minimum; there is no attempt at general descriptions or artistic appreciations, but the essential parts of the history are stated in a clear and concise manner, and references to the chief publications are duly given.

Altogether, the author deserves the highest praise for bringing before us this valuable material, particularly as it was a work which, while it required infinite patience and exactitude, was unrelieved by the stimulus of original research or the building up of theories, so dear to the hearts of most archæologists.

"A, B, C of Old English China" was announced by George W. Jacobs & Co., and not, as we stated, by John Lane Co.

Hutchinson & Co. include in their spring list "John Opie and his Circle," by Ada Earland, author of "Ruskin and his Circle." An appendix will contain a list of Opie's pictures.

The German archæologist and assistant director of the Royal Museum at Berlin, Prof. Otto Puchstein, died recently at the age of fifty-four. He made a careful study of the sculptures at Pergamon, and published several works. He wrote: "Reisen in Kleinasien und Nordsyrien." with Humann; "Pseudohethitische Kunst," "Beschreibung der Skulpturen aus Pergamon," and "Die griechische Bühne."

Henry A. Ferguson, the landscape artist, died last week at his home in New York city. He was born in Glens Falls, N. Y., about sixty years ago, and was educated at Trinity College. When he left college he travelled extensively, and set up his easel in Egypt, Italy, Mexico, and South America. In recent years Mr. Ferguson had devoted a great deal of his time to the restoration of paintings, a work in which he achieved great success. He was an associate member of the National Academy of Design.

Finance

TRYING TQ READ THE FUTURE.

On Friday of last week, total transactions on the New York Stock Exchange fell to the smallest aggregate of any full business day since July, 1908, when the after-panic inertia seemed to have reached its climax. On Monday of this present week transactions touched a still smaller figure; the day's whole business being 150,000 shares, as compared with one day, almost exactly a month ago, when nearly a million shares changed hands, and with a daily average of upwards of half a million only a few weeks ago. Under such circumstances, "dulness" has itself become the principal topic of conversation in the Wall Street offices. It is plain enough that the outside investing public, taken as a whole, is neither buying nor selling stocks; that foreign markets are not dealing actively in our shares; that the large banking houses are taking no aggressive attitude, and that therefore even the professional speculators on the floor of the Exchange are unable to discover any continuing tendency. Even as regards prices, it is possible to say that, at this week's opening, the half-dozen most active stocks hardly varied half a point apiece from their prices of March 1. At such times the question follows, What does this complete financial hesitation mean?

At the moment, it is probably true that the business community is divided between two main opinions—one, that American industry, having finished the work of drastic readjustment, is awaiting the signal for another forward movement; the other, that it is pausing on the brink of renewed and even more general reaction. The basis for the first opinion is the country's unvarying experience with the severe industrial setbacks of the past ten years. The basis for the second is the experience of other generations. Seasons of trade depression such as 1904 and 1908 were largely completed in the compass of a year, and the halt after twelve months' liquidation we now know to have signified, not the inertia of exhaustion, but the massing of tangible resources in advance of another "boom." But seasons of depression such as followed 1876 or 1890, for example, were the affair of years; they embodied not only radical and permanent revision of staple prices, of wages, and of cost of living, but thorough change in methods of doing business.

Now it is true, the teaching of all history is that the kind of prosperity that is marked by violent speculation and by intense industrial activity, goes by long upward and downward swings which cover a stretch of years. When the sensational chapter of 1869 and 1870 had been closed, no other chapter like it was opened in this country until 1899 and 1901. Furthermore, it may be admitted without the slightest hesitation that the general trend, from that point of view, has been downward ever since 1901. Such a receding movement is never continuous and unbroken; each relapse is followed, just as it was before, by another upward surge. But the boom of 1906 was a very much smaller thing than that of five years before, and it is not at all improbable that the next forward movement, even if more substantial than the illusory boom of 1909, will be still less spectacular than 1906. But that is not the same thing as saying that the country is in the sweep of a movement of prolonged depression. On the contrary, it is possible to argue that progress on conservative and stable lines, even if the speculators and promoters find their energies shackled by circumstances, is in the long run an infinitely more wholesome condition than the crazy delirium of a decade ago.

As for the notion of an impending plunge into a gulf of black depression, there is one simple fact to which people may as well pin their faith. This is the same United States as that of a decade ago—stronger because of its increase in population, its development of resources, its expansion of facilities, its recent study of economics in production, and, not least of all, because of its gradual escape from a false and mischievous system of industrial exploitation of which the fundamental ideas were the wasting of natural resources and the perfectly unscrupulous dissipation of capital.

Most other nations, after passing through such an experience and learning its necessary consequences, would have found that the horse was gone some time before the owner had got to the stable door, and some of them would have proceeded to burn the stable down. But the American people were more fortunate. Having reached a thorough comprehension of what had been going on, they have busied themselves with fitting bolts and bars. It is quite in keeping with the programme that this procedure should have started an outcry that we were putting a quietus on all future booms and were strangling that prosperity which, but for this sudden stupidity of people, law-makers, and courts, might have gone on forever on the scale of 1901. The probability is, however, that the nation itself has reached the conclusion that it has had quite enough of that brand of prosperity to last for a generation.

Bergson's Creative Evolution

Authorized translation by ARTHUR MITCHELL, revised by the author. 407 pp. 8vo. $2.50 net.

The late WILLIAM JAMES, reviewing the French edition said: "Bergson's resources in the way of erudition are remarkable, and in the way of expression they are simply phenomenal. Open Bergson, and new horizons open on every page you read. It tells of reality itself. Nothing in Bergson is shopworn or at second-hand."

W. J. Henderson's Some Forerunners of Italian Opera

By the musical critic of the "Sun," author of "Richard Wagner, His Life and Dramas," "Modern Musical Drift," etc. A notable book on the Mediaeval lyric dramas before Peri and Caccini. Several chapters are devoted to a vivid account of Polizeano's "Orfeo," and its performance. 243 pp. 16mo. $1.25 *net.*

Household Administration in the Higher Education of Women

QUICKSANDS

A NOVEL

By Fannie Heaslip Lea

12*mo. Illustrated.* $1.20 *net.*

Brilliant dialogue, a subtle sense of the comic and the tragic, a graphic touch in the portrayal of an attractive group of people and their environment, and, in general, a fine artistry, characterize this novel, which presents a recurring problem—a wife out of love with her husband and deep in love with another. How she contrives to save something of honor and happiness from shipwreck is the theme of this engrossing story.

BOOKS WHICH CONCERN
THE BUSINESS WORLD OF TO-DAY

The Standard of Living

By FRANK H. STREIGHTOFF. In his study of the life of the industrial classes in America, the author shows that unemployment is one of the greatest burdens of the laborer, and that in many cases the family income is below the minimum necessary for efficiency, as evidenced by the facts that housing conditions are widely unsatisfactory, that nearly one-third of the industrial families are insufficiently nourished, and that saving is extremely difficult. $1.00 *net*. Postpaid $1.10.

Industrial Accidents and Their Compensation

By GILBERT L. CAMPBELL. "The directness and conciseness of the essay will commend it as an introduction to the study of one of the most important governmental problems of the time."—*Springfield Republican.* "Every thoughtful man, and especially every employer of labor, should buy and read Mr. Campbell's book."—*Wall Street Journal.* $1.00 *net*. Postpaid $1.10.

Federal Regulation of Railway Rates

By ALBERT N. MERRITT. "Its arrangement and use of facts are sufficiently free from technicalities to make it valuable for any intelligent person who is interested in the important subject of which it treats."—*New York Sun.* $1.00 *net*. Postpaid $1.10.

Ship Subsidies

By WALTER T. DUNMORE. "A book to be read with profit by all who are interested in the revival of American shipping"—*Chicago News.* $1.00 *net*. Postpaid $1.10.

Socialism

By OSCAR D. SKELTON. "This critical analysis is a distinct contribution to the understanding of a much-discussed and befogged subject."—*Boston Transcript.* $1.50 *net*. Postpaid $1.65.

The Cause and Extent of the Recent Industrial Progress of Germany

By EARL DEAN HOWARD. "Mr. Howard's is a most interesting and enlightening review of conditions in Germany, full of suggestiveness to students of social economics in America."—*Milwaukee Free Press.* $1.00 *net*. Postpaid $1.10.

The Causes of the Panic of '93

By WILLIAM JETT LAUCK. "One of the best studies that has yet appeared of one of the most serious of these panics."—*Providence Journal.* $1.00 *net*. Postpaid $1.10.

Industrial Education

By HARLOW STAFFORD PERSON. "Young men anticipating a business life cannot be too thoroughly acquainted with the methods here discussed."—*Westminster.* $1.00 *net*. *Postpaid* $1.10.

Origin and Growth of the American Constitution

By HANNIS TAYLOR. Mr. Taylor's earlier widely-known book on the English Constitution, his recent discovery of the Pelatiah Webster pamphlet,—undoubtedly the source of our own constitution,—and his long experience as an international lawyer and diplomat, make especially important and authoritative this volume. $4.00 *net*. Postpaid $4.25.

Public Ownership of Telephones

By ARTHUR N. HOLCOMBE. "It is eminently sane, eminently fair, eminently honest. No student of the economic and political aspects of public utilities, and no practical telephone man, can afford to disregard this important book."—*Chicago Record-Herald.* $2.00 *net*. Postpaid $2.17.

TWO IMPORTANT BOOKS

PRAGMATISM AND ITS CRITICS

By ADDISON W. MOORE. 294 pages, 12mo, cloth; postpaid $1.36

This is the clearest and most satisfactory summing up of the controversy that has yet appeared. Even the most technical matters are presented in such a way as to be intelligible to anyone who is genuinely interested in the movement. The book covers all the important points at issue, but special emphasis is laid on: (1) The historical development of the pragmatic movement; (2) Its relation to the conception of evolution; (3) The social character of pragmatic doctrines.
The treatment is sympathetic and incisive.

THE MEANING of SOCIAL SCIENCE

By ALBION W. SMALL. 320 pages, 12mo, cloth; postpaid $1.62

Outlines a plan of co-operation among the various types of specialists in social science. Its keynote is the proposition that the main business of social science is to be the agent of all men in finding out the meaning of life, including in particular the means by which men may most surely progress toward the largest realizations of life.

Important New Macmillan Books

JUST READY

Mrs. Alfred Ely's *new book*
The Practical Flower Garden

By the author of "A Woman's Hardy Garden" and "Another Hardy Garden Book." Among the special charms of the volume are its chapters on caring for "some green things of the earth," trees, shrubs, and lawns, and on the possibilities of "the wild garden."

Ready this week. $2.00 net; by mail, $2.15

THE BEST NEW NOVELS, ETC.

Mrs. Roger A. Pryor's *new novel*
The Colonel's Story

Full of that appeal of a vanished charm, that atmosphere of the true old south, which so distinguishes Mrs. Pryor's "My Day" and "Reminiscences of Peace and War" *Cloth, $1.20 net; by mail, $1.32*

F. Marion Crawford's *uncanny*
Wandering Ghosts

It is curiously fitting that the last volume to be added to the long shelf of Mr. Crawford's novels should come so close as this does to making one actually *feel* the supernatural. *Cloth, $1.25 net; by mail, $1.35*

Gustav Frenssen's *great novel*
Klaus Hinrich Baas

"A big, strong, meaty novel, rich in mature thought, and with a life-size portrait of a real man in it."—*Chicago Record-Herald.* *Cloth, $1.50*

Jack London's *new novel*
Adventure

The book is vividly imaginative; one feels the strain of tropic heat and the tension with which white men hold the mastery of the Southern Seas, as keenly as one felt in "Burning Daylight" or "The Call of the Wild" the iron grip of the Arctic cold. *Cloth, $1.50*

Mrs. Hubert Barclay's *charming novel*
Trevor Lordship

Appeals to those sensitive to the finer emotions and hidden beauties of life. *$1.20 net; by mail, $1.25*

The Justice of the King
By Hamilton Drummond

Colorful, exciting, altogether charming in its atmosphere of adventure, song, youth, and tender love-making. *Cloth, $1.20 net; by mail, $1.32*

The Book of Love

Introduction by MADISON CAWEIN.

Decorations by W. T. Benda. Bits of literature touching life's greatest emotion, gathered into a form like that of "The Book of Friendship," etc.

A new volume in "The Friendly Library." Cloth, $1.25 net; limp leather, $1.75 net

Professor **Irving Fisher's** *new book*
The Purchasing Power of Money

An explanation of the causes of the increase in the cost of living and the fluctuations of prices between 1896 and 1909. *Cloth, 8vo, $3.00 net; by mail, $3.20*

Professor **Edwin R. A. Seligman's** *new book*
The Income Tax

The author, one of the most competent judges in the country, makes it evident that an income tax is bound to come, and prepares the way for a practical program of adoption which should be the means of preventing costly errors in experimental legislation.

Cloth, 8vo, $3.00 net; by mail, $3.20

Henry Osborn Taylor's *illuminating book on*
The Mediaeval Mind

By the author of "Ancient Ideals." It presents from original sources the emotional and intellectual development underlying the literature, philosophy and illustrative phases of life in the Middle Ages.

Two volumes. $5.00 net; carriage extra.

Professor **Patten's** *new book*
The Social Basis of Religion

By SIMON N. PATTEN, Ph.D., LL.D., Professor of Political Economy, University of Pennsylvania, author of "The New Basis of Civilization," etc.

Cloth, 12mo, $1.25 net; by mail, $1.35

Dr. **Charles E. Jefferson's** *new book*
The Building of the Church

"Within the limits of my own knowledge and recollection of the Yale Lectures on Preaching this course of Dr. Jefferson's is the most valuable since 1877, when Phillips Brooks was lecturer."—OLIN A. CURTIS in *The New York Christian Advocate.*

Cloth, $1.25 net; by mail, $1.35

Professor **William Lyon Phelps's**
Essays on Russian Novelists

By the author of "Essays on Modern Novelists," the work, as the *Baltimore Sun* expresses it, of "an academic critic without academic superstitions."

Cloth, 12mo, $1.50 net; by mail, $1.62

Professor **Richard G. Moulton's** *new book*
World Literature

Exceptionally valuable as showing in perspective the unity of all literature from the point of view of English-speaking people. By the author of "Shakespeare as a Dramatic Artist."

Cloth, 12mo, gilt top, $1.75 net; by mail, $1.87

Professor **L. H. Bailey's** *new book*
The Country Life Movement

The problem discussed is not the movement from the city "back to the land," but of advance in the genuine permanent conditions of country life.

Cloth, $1.25 net; by mail, $1.35

Published by THE MACMILLAN COMPANY 64-66 Fifth Ave. N. Y.

The Nation

NEW YORK, THURSDAY, APRIL 6, 1911.

The Week

An excellent beginning was made by the House Democrats at Washington in their caucus on Saturday. The saving of $200,000 in the annual pay-roll of the House may not be in itself a matter of tremendous consequence to the Treasury of the United States, but the spirit indicated in it is of the most vital importance. The very point where economy pinches, in the mind of the average Congressman, is in the cutting out of places which he has a chance to parcel out as political favors; if the Democratic Representatives have been able to resist the temptation of keeping these "jobs" open for their hangers-on, it ought to be easy for them to put the knife in deep where the cutting does not come so near home. The efficient leadership which must have gone to bringing this about seems also to have been displayed in a number of other directions. A sense of responsibility for the success of the Democratic conduct of the House at a time at once so auspicious and so critical as the present is evidently felt by the new majority, and is shown in taking hold vigorously of such questions as that of the organization of the House, the improvement of the new rules of procedure, etc.

The harmony and definiteness of purpose that were manifested give promise of a record for the Democrats in the extra session which will greatly strengthen the party before the country and have a most important influence on the Presidential campaign of 1912. In committing the party to the Canadian reciprocity agreement, the caucus follows up the good record made in Congress on that subject in the last session, and points to a still more united front upon it in the session which has now begun. By this support of President Taft's measure the Democrats will procure for themselves the lion's share of the credit for the achievement of this forward step in national policy, upon which the Republicans made a sorry showing in the Sixty-first Congress. It is perhaps too much to hope that the party will be piloted through the shoals and narrows of tariff revision without some trouble and mortification, but it looks at present as though a clear-cut and intelligent programme would be kept to the front and on the whole faithfully followed. In giving to the election of United States Senators by direct vote of the people the first place in the party's programme, the caucus has recognized the all but unanimous desire of the nation for this reform; and we trust that it also recognizes the virtual necessity of avoiding the purely factitious difficulties which were permitted to bring about its defeat in the last session of Congress. Perhaps most significant of all, the alleged impossibility of making the House organization work except through the autocratic rule of a czar-like Speaker has been manfully grappled with.

Tariff for revenue, with incidental and reasonable protection—this about sums up the position of Representative Underwood of Alabama, who is to be chairman of the Committee on Ways and Means in the Democratic House of Representatives. Mr. Underwood's method of testing the propriety of certain tariff schedules, as to their conformity with this principle, is interesting both from a logical and from a practical standpoint. When importations constitute only an insignificant percentage of our total annual supply of a given class of goods, he regards this as proof that the duty is unjustifiably high—this on the double ground that it is not a true revenue-producer and that it rules out competition. The first point is self-evident; in the second the case is perhaps not so obviously clear, since the absence of importations may be due to our own advantages rather than to the prohibitiveness of the tariff. But Mr. Underwood would doubtless answer that if the non-importation is due to our advantages in the way of cheap production, then there can be no harm in cutting down the duty, which is supposed—in so far as it is protective—to be laid on to counterbalance disadvantages, not to confirm advantages.

On the whole, while this test of a tariff tax, upon the vague principle of a revenue tariff with incidental protection, is of course not an instrument of scientific precision, there is a great deal to be said for it as against the modern Republican expedient of determining the difference of cost of production by special research. This latter method is certainly difficult of application and will unquestionably leave room for a vast amount of difference of opinion; whereas Mr. Underwood's plan, which goes on the maxim that the proof of the pudding is in the eating, has the merit of simplicity at least. Call a tariff prohibitive when it works like one is the idea—and it is not so bad, as far as it goes. If we were to add the further requirement that when the tariff *rate* is on its face unreasonable—whether prohibitive or not—it must be cut down to a reasonable figure, the two things together would go far toward constituting a satisfactory guide to practical tariff reform.

Monday's decision by the Supreme Court considerably limits the scope of the so-called "commodities clause decision" of 1909. It declares, in effect, that stock ownership by the railway in the producing company may not be so employed as to continue the absolute control of the transportation company over such production. As the Chief Justice puts the matter, even this stock ownership cannot entitle the railway "to do by indirection that which the commodities clause prohibits"—something which would plainly be done "by the unnecessary commingling of the affairs of the producing company with its own so as to cause them to be one and inseparable." Apparently, therefore, a railway may lawfully hold control of the stock of producing companies along its line, but may not exercise such control. This further interpretation of the law may have been foreseen by one of the railways concerned in the original suit, the Lackawanna, which organized, after the decision of 1909, a $6,800,000 corporation to take over the railway company's coal-mine properties, the stock of the new company being offered pro rata to Lackawanna shareholders, and the officers and directors of the coal company not duplicating those of the railway company.

The Department of Agriculture an-

nounces that it is ready to begin operations looking to the purchase of land by the National Forest Reservation Commission created under the Weeks Law. The law was passed with special reference to the creation of national forests in the Appalachian and the White Mountains, and under it the Secretary of Agriculture is to examine, locate, and recommend for purchase such lands as in his judgment may be necessary for regulating the flow of navigable streams. These purchases are not restricted to particular regions, except that they may be made only in States whose legislatures have consented to such acquisition. New Hampshire is one of these, and the first lands to be examined will be those which the law was particularly aimed to reach. Although the area in need of protection is much larger than the Government can purchase, the Department hopes that careful selection will do much for the permanent improvement of the watersheds. Since high prices cannot be paid, it is probable that little land having a heavy stand of merchantable timber can be bought, nor will good agricultural districts be considered. Owners may reserve the right to remove valuable mineral deposits which are known to exist, and Secretary Wilson hopes for the display of such public spirit as will result in procuring lands at moderate or even nominal prices. The lands acquired will be protected from fire, and the growth of the timber will be improved as much as possible. They will not be game preserves, but will continue to be open to the public for hunting and fishing in accordance with the State laws.

Fire destruction in the Capitol at Albany being only partial, it is to be taken for granted that the building will be "restored." Even so, the cost to the State will be, it is estimated, $4,000,000 or more. And although the entire appropriation may not have to be made by the present Legislature, it is evident that this unexpected disaster, with its consequent large outlay, will pretty surely make it impossible for Gov. Dix to keep his promise to reduce the annual budget. That he could have cut as much as $4,000,000 from last year's appropriations was, in any event, highly improbable. The large expense which the State is regularly under for public buildings—prisons, asylums, hospitals, and so on—is one of the main reasons why the budget has gone on increasing. All this work of construction is paid for directly out of current revenues. In the city of New York, bonds are issued for such building, and so nothing but the interest charges at once made a yearly liability. Gov. Hughes more than once dwelt upon the different way in which the State does its building, with the inevitable result that higher taxes go with the policy of paying as you go. If the Capitol had been entirely destroyed, so that an outlay of $15,000,000 or $20,000,000 for a new structure had to be faced, it is altogether likely that some way of borrowing the money would have been proposed.

It is highly probable that the so-called "Gaynor Charter" for New York city will not even be taken up seriously by the Legislature, in the urgency of other business after the recess. This will tend to prevent anything like full discussion for the present. The new document contains several excellent proposals. One is to reduce the enormous bulk and clear up the ambiguities of the existing Charter. There will be opposition, however, to the plan of cutting down extensively the powers of the elective Controller, and transferring many of them to the appointive Chamberlain. With the latter official to-day what he is known to be, the suggestion seems almost jocose. Nor do we think that the soundest opinion will be with the Mayor in his proposal to replace the present Board of Education with a salaried Board of seven members. That the existing membership of more than forty is unwieldy and ought to be reduced to ten or fifteen, we believe that most authorities on education agree. But the idea that the smaller body will need to be paid for their services seems to us mistaken. We are confident that competent men and women can be found who will be glad to do this work for the city without a money reward. And if the notion is to get seven educational experts who ought to be paid for their time, that, too, is to go on the wrong track. There should be, as there are, high experts in the department, but they should remain under the direction of the Board of Education, and not enter its membership. For the best service there, we need men and women of large intelligence and entire devotion to the best interests of the public schools, who will pass upon plans and determine policies, not with technical expertness, but in a spirit of wise general administration.

Nearly six hundred different persons contributed a total somewhat above $57,000, in amounts ranging from $10,000 to one cent, to the campaign of Professor Merriam in Chicago. Names and amounts have been published in a sworn statement. As the Merriam primary campaign cost $40,000, here is a grand total of virtually $100,000 spent in the effort to elect a Mayor. The largest contributor gave $8,000 to the primary campaign, and $10,000 to the present one. What the two contests have cost Harrison is uncertain, as his list of contributions is admittedly incomplete. His unsworn statement of his personal receipts contains items of sums from ten cents to $4,000, and totals $17,000. The largest item of the Merriam expenditures was $15,000, which went for advertising. For salaries and expense of headquarters $9,000 was paid out, while ward headquarters and organization cost above $6,000. It is not just, however, to saddle these amounts upon the Mayoralty campaign alone, as the ward contests must have been aided by them. The ordinary voter does not begrudge the dollar which a rough calculation may indicate as his share of the preliminary outlay, so long as he can trace its expenditure and knows it to be honest. He may, however, feel chagrined over the results. Despite the outlay of money, Carter H. Harrison has been elected Mayor, for the fifth time, by a plurality of nearly 18,000.

A gleam of hope for the fitting recognition of art in New York is given by the action of the National Academy of Design in adopting a new plan to procure an adequate building for exhibition purposes. The scheme is to bring about a union of all the principal art organizations of the city, and to seek to house them under one roof. It seems to be the expectation that this larger project will appeal to wealthy men, who are notoriously fond of combinations, and might produce the necessary funds, if not for an Academy, then for an Art Trust. Be this as it may, everybody must hope that in some way and soon the reproach may be taken away from

New York that it is more inhospitable to artists than is Philadelphia or Baltimore or Pittsburgh, not to mention scores of European cities.

San Francisco's lost opportunity in the matter of housing conditions is pointed out by the secretary of the Housing Association of that city in the *Survey*. Here was a city built on the hills, swept clean by fire. "Surely the builders would grasp their unrivalled opportunity." But to-day, instead of a city of homes, it is a city of tenements. The primary reason for this condition is found in the necessity, following the fire, for shelter, the kind being less important than the promptness with which it was provided. The result was that in less than a year the city was face to face with a housing problem which there was no law to keep from growing worse and more formidable. A tenement-house ordinance, however, was passed, not without difficulty, based upon the New York law, with its requirements for light and air. Even these restrictions were soon evaded, and the ordinance itself bitterly opposed by speculative builders and property holders. It was seen that a State law was imperative. Here again the opposition was so strong that the New York law was all that could be obtained. The latest phase of the struggle centres about the "Romeo flat," which, despite its common stairway, evades the tenement law by virtue of its separate entrances. A bill to remedy this defect is under consideration by the California Legislature, but it is unfortunate that prevention was not chosen instead of cure, and a great calamity thus turned, in part, into a blessing.

The celebration of the Bible tercentenary is being made the occasion for earnest demonstrations in behalf of international arbitration. We take it that this is more than our human fondness for tying up subjects that happen to be to the fore in the day's news. That Mr. Taft's proposals for a comprehensive British-American arbitration treaty should have come just in the three hundredth year of the English Bible, as we know it to-day, is a coincidence; but it is one of the dramatic coincidences that impose themselves upon the popular imagination because of their extraordinary aptness. In a very real sense the Bible has been, to use Mr. Taft's words, the precious tie that has bound together the Old and New Worlds. The book has been not merely a common heritage for the two peoples; it has played a most important rôle in the actual peopling of the new continent from the old. It was because men in the seventeenth century read their Bibles differently that New England was founded. To-day the tendency is to pick out in the Bible what all men can agree on. Its actual history has been that of a beneficently disruptive and a beneficently unifying force.

Diaz's message to the Mexican Congress makes the mistake of yielding but not yielding enough. The promises held out by the aged President would have been sufficient to bring appeasement a year ago. But it is idle to suppose that after putting the erstwhile dictator on the defensive, the revolutionary leaders will be content with a policy of shutting their eyes and opening their mouths and seeing what happens to them. For a shrewd man of affairs the Mexican President has latterly been peculiarly blind to his own best interests, in the highest sense. Of earthly power he has surely had more than enough. In the course of nature he must have been prepared to pass from the scene in a few years at most. Had he chosen to retire with good grace, he might not only have had the nominating of his successor, but would have gone into private life amidst the plaudits of his countrymen, his faults forgotten, his services freely acknowledged. Diaz at eighty, unsatisfied with forty years of sovereignty, playing the dog in the manger, is surely less imposing a figure than Diaz the great President emeritus would have been.

Within less than three months from the time of his arrest, the London murderer, Morrison, has been tried, found guilty, had his appeal passed upon, and been handed over to his fate. Coming closely after the courts' procedure in the Crippen case, this affirmation of the law in England as being law and not a game, throws our own system into shameful relief. Consider what is now going on at Cincinnati in the case of one George B. Cox. This most vicious example of the political boss has at last been haled within sight of the reward that has come to Abe Ruef. To escape this fate George B. Cox has been fighting in the courts, not to prove his innocence, but to prevent his case from going before a judge whom he fears. Hence we have just had the following beautiful example of the functioning of our judicial machine: By the vote of two judges against one judge, it has been decided to issue a mandamus against a fourth judge, ordering him to pass on the question why George B. Cox should not be tried before a fifth judge —the one he is afraid of. Why blame the Socialists for railing at our courts? It would be more than human to omit the opportunity.

The German Chancellor admitted a week ago that by the principle of unrestricted arbitration two nations like Great Britain and the United States could dispose of all matters of controversy at present in sight; but if new questions arose arbitration might prove inadequate. Now, at first sight it may appear to be very practical and very statesmanlike to scan the future for objections to a scheme that is eminently desirable in the present. But actually there are occasions when burrowing into the future is only borrowing trouble. Especially is this true of an innovation like international courts of arbitration against which not even the most ardent opponent can say that it will do harm. The worst that can happen to a system of universal arbitration is that it may fail. To go on constructing hypothetical situations in which arbitration would not work is to argue in a truly undergraduate manner. What human institution is there that does not on occasion break down? If the German Chancellor were working for the legalization of monogamy by the Reichstag, he could point to our modern flourishing divorce courts as proving that contingencies must arise when marriage is a failure. The German Chancellor is probably not in favor of abolishing all courts of criminal justice and reënacting the law of fist and claw. Yet phenomena like the Higher Law and thriving alienists eloquently attest the very frequent breaking down of the laws against murder. To reject universal arbitration because it won't create heaven on earth, is childish. The point is whether arbitration cannot do something to make earth a bit more inhabitable than it now is.

LABOR UNIONS AND EFFICIENCY.

Mr. Frank B. Gilbreth, the building contractor who has worked out a system of scientific brick-laying, has a strike on his hands at Glens Falls, N. Y., where he sought to put the new method into effect in erecting a large mill. The case is a good concrete illustration of the general difficulty of getting labor unions and experts in efficient management to bring their minds together. On its face, and looking solely at the question of visible results, the matter seems to be simplicity itself. Mr. Gilbreth proposed to cut down the hours of the bricklayers from eight to seven and one-half, and to increase their pay from 55 cents an hour to 75. This great gain to labor he was able to offer by means of his mechanical and other devices to make the process of brick-laying simpler and more rapid. But the plan involved keeping a close tally on each man's work, the bonus being paid for actual number of bricks laid, and the tendency being, of course, to put a premium on first-class work, and gradually to weed out inferior workmen. It was on the latter account, mainly, that the men struck. Their union would not consent that any of its members who, for age or other reason, were not up to a high standard of efficiency, should be discriminated against. They demand a rate per hour alike for all, with no watch upon the output of the individual bricklayer.

We must not be too hasty in denouncing this and a similar attitude on the part of many labor unions as the height of unreason. Something is to be said for their point of view. With much in it that is short-sighted, selfish, obstructive to progress, and even tyrannical, it has an element of human nature in it and often of humanity that cannot be overlooked. It will not do to scoff at the fraternal feeling which leads laboring men to think of their fellows who are too old or too feeble physically to endure the extreme of competitive conditions. Nor can we dismiss without a hearing the plea that a man should not be treated exactly as if he were a lever or a cog in a machine, to be speeded to the limit and thrown away when worn out. This is, of course, a grossly distorted view of what scientific management aims at, but it is one which thousands of workingmen have firmly got in their heads, and it has to be reckoned with in the long work of conciliation and adjustment which will be necessary before the gospel of efficiency is accepted. The new processes are bound to be adopted. No one can doubt that who believes that knowledge is certain to expel ignorance, and skill vanquish blundering. But there will first have to be a great deal of delay and friction and tentative experimenting. Before there can be full success there must be a clarifying of men's minds regarding the fundamental principles involved.

The labor organizations number many able and tenacious men among their leaders; and they must be made to see that the unions cannot afford to place their huge bulk across the track of advancing industrial efficiency. Such objections as they have to the new methods must not be stated so as to make it appear that they stand for waste instead of saving, or that they are going to fall again into the old fallacies of hostility to labor-saving machinery. There is too much of the latter in the attitude of some representatives of organized labor —as evidenced, for example, in the persistent opposition to the introduction of power presses in the Bureau of Engraving at Washington—and there is also too plain a feeling on the part of many unions that the thing for laboring men to do is to "make work." So far as this is at the bottom of antagonism to the new plans for efficient management, it puts organized labor into a position wholly indefensible. Civilization has advanced by eliminating work, not making it, and the laws of progress will in this respect remain unchanged in the future. But hope lies in the fact that few labor leaders can be found to-day openly opposing the use of improved machinery, even though it temporarily throws some men out of work, or avowing the doctrine that the interest of workingmen is to have the world's manufacturing and building done on the scheme of "ca'canny"—that is, as slowly and awkwardly as possible. There is thus no acknowledged radical difference in principle between the unions and the efficiency engineers, so that, in time, it ought to be feasible to arrive at a working agreement between the two.

This should come along the lines of a common understanding that a great gain is to be won by scientific management, and that then the fair share of workingmen in that gain is to be reasonably determined. That is where the labor unions will come in with their power to make collective bargains. There is no reason why they could not function as well under the new conditions as under the present. But they cannot even exist, they will be destroyed, if they set themselves unyieldingly against the application of science to industry. Trained minds and observant intelligence are being directed to-day in many trades to the question how to reduce human effort to the minimum, and to heighten production with lessened exertion. That can mean only a vast good, and any man or organization that withstands it must be thought of as an enemy of human progress. The questions how to use that good, how to divide it, how best to make it the basis of social content and further advance, will press for reasonable decision later. But on the main issue, the previous question, of scientific management—which means the enlargement of knowledge, the economy of muscle, and the freeing of man from useless labor—there can be no serious debate. The new principle is seizing upon men's minds in all countries, and the industrial democracy that refuses to admit it and act upon it is in danger of perishing. The man or union who resists the great innovation is in a fair way to commit what Doctor Johnson called "civil suicide."

THE SENATORIAL OUTCOME.

To Judge O'Gorman it is due that his qualifications for the New York Senatorship should be examined to-day just as if he had been brought forward and elected on January 17. In that case one would have had to say, as now, that he has the reputation of being a good lawyer and an able and honest judge. But one would also have had to say that he had long been identified with Tammany, was on friendly terms with Murphy, whose rule he had never questioned or opposed, and that his election to the Senate would be a distinct triumph for Tammany and its boss. All this is in no wise dimmed by the fact that Senator Roosevelt declares that Judge O'Gorman would have been from the first acceptable to the insurgents, or that Mr. Stetson, as long ago as February 7, mentioned O'Gorman's name as among those to whom there would be no objection. We must look at things

as they are. It is true that Murphy was not able to force the election of Sheehan, whom he did not really want, or of Cohalan, whom he did want, or of his second or third or fourth preference, but that, nevertheless, the final naming of the Senator was done by him. Judge O'Gorman's views on public questions were absolutely unknown. After his election, he put forth a statement of them which is fairly satisfactory. But what a howling absurdity it is first to elect a man and then find out who he is and what he thinks! It is not surprising that the advocates of the direct election of Senators at Washington are already seizing upon the manner of Judge O'Gorman's election as the clinching argument for their cause.

In any fair summing up of the long struggle at Albany we must "consider our mercies," and first among these we reckon the defeat of the plot to elect Mr. Sheehan. We write without a particle of personal animosity against him, but it is impossible to be blind to the fact that his election would have been an incalculable public misfortune. This we assert partly on account of the way in which his nomination by the caucus was originally procured. No one denies —he himself has virtually admitted —that the thing was done by his being able to bring to bear upon Murphy forces too powerful for the boss to resist. And that these forces were as abhorrent as they were secret, nobody has had the hardihood to question. But behind this ugly fact, of itself enough to damn any candidate, lay the early and unforgettable political record of Mr. Sheehan. Now, on that subject there has been a good deal of mushy talk. It is said that we ought not to fling old political misdeeds in a man's face. Agreed, in all that relates to him personally and in a private capacity, provided he is striving to rise on his dead past to better things. But publicly, it is of the highest importance neither to forget nor to forgive a career such as Mr. Sheehan ran in the eyes of all the people of this State. It is not only right, it is desirable and essential, that it should pursue him like a remorseless Nemesis to the end of his days. For consider what the example of his success would have meant to observant youth. They would have read in it warrant for practising the basest arts of politics, for defying public sentiment, for outraging the best feeling of one's own party, all in the belief that such things would be condoned when the time was ripe to strike for high office. From that demoralizing lesson the young men of New York have been preserved; and in the frustration of Mr. Sheehan's ambition they will see the wholesome moral that such acts as he was notoriously guilty of are ever afterwards his fatal shadows.

This great and useful moral demonstration could not have been made had it not been that enough Democratic members of the Legislature were found with sufficient principle and courage to defy and nullify all the trickery and tyranny of the caucus. To the insurgents in the Democratic ranks at Albany we must make our acknowledgments for the pluck and determination with which they have stood together, despite the most tremendous pressure, and saved the State and their party from Sheehan. They have been spoken of as disrupters of the party, and more responsible than anybody else for the spectacle of Democratic quarrelling and futility. But they have been really the men to give honest folk some heart of grace for the future. If there had been no dissent, no open revolt, we might well have despaired of the Democratic party in New York. If everybody had lain down under the decree of Murphy, as meekly as the Republicans all those years permitted Platt to set his foot upon their necks, it might have been said that there was no hope. But the bold fight of the Democratic insurgents, which some have deplored, was the cheering sign that life and conscience were not extinct, that manhood had not wholly gone out of the party, and that a spirit had been roused which would leave the Tammany boss in no doubt that men would always hereafter be found to despise his swords. And we are confident that those who to-day are hailing and thanking Senator Roosevelt and the men who so gallantly stood with him all these weary weeks, are but anticipating the verdict of the political historian when they say that these men performed the greatest service to their party.

In rejoicing, however, at the good fight that has been fought against the powers of evil, we must not forget how great those powers are or how menacing they remain. Say what we will about what we have escaped, what we still have to face is appalling enough. Murphy's strength, even when clipped and crippled, is the startling and terrible thing. That he was ready to use it unscrupulously, and without a single thought for the good of his party and the welfare of the State, we knew; but few could have expected the malign exhibition which he has given, with its resultant disgrace to the Democracy of New York. If such a leadership as his is now known to be is not challenged and broken, then there is no limit to the outrages and insults which honest Democrats will endure.

THE NEW JERSEY ELECTIONS LAW.

While the direct primary which both parties in New York promised hangs fire, the reform of New Jersey's primary and election laws is nearly consummated. The so-called Geran bill has passed the Assembly and is expected to go through the Senate with only slight changes. This measure, which it is admitted by all would have had no chance of enactment but for Gov. Wilson's vigorous advocacy, contains some novel features, and is in general so thoroughgoing as fairly to revolutionize the practice in New Jersey. That State has long been in crying need of some such improvement. Its ballot laws, in particular, have been very loose and open to abuses. The whole question is dealt with comprehensively in the Geran bill, which, with its forty-four folio pages, is a somewhat formidable document.

To begin with the novelties, we note a striking new departure in the method provided for appointing the officials who make up the boards of registry and election. These officials are almost everywhere named by party bosses or committees. Their positions are among the petty rewards for party workers; and it often happens that incompetent or positively dishonest men are selected. Under the proposed statute, however, these appointments are to be made only after examination and in accordance with civil-service rules. The offices are to be divided equally between the parties, as is proper, but the nominees are to be tested as to eyesight, the ability to add and subtract correctly, and to write a legible hand, good health, etc.; and an eligible list is thus to be created from which appointments shall be made by lot. All this involves, of course, a good deal of machinery, but the end aimed at is certainly worth attaining. If the pri-

mary system is to be extended and safeguarded, and if the spread of independent voting is to make the need of accurate and trustworthy election clerks more imperative, the law-makers are justified in taking the necessary steps.

Another unique provision of the New Jersey law is for the election of delegates to National Conventions by a direct primary, nominations in a given district to be made by petition of not less than one hundred members of any political party. The Secretary of State is to certify such nominations to county clerks, who will proceed to print the names on the official ballots for the primary. The bill provides that candidates for the position of delegates to National Conventions may be grouped together, and that they may have placed opposite their names the candidate for President whom they favor, under the caption "Choice for President." This is something new in our politics. It furnishes an opportunity to the voters to express their wishes in regard to the Presidency much more directly and emphatically than has been the case in the past. Everything, to be sure, will depend upon the zeal and spirit which are brought to the new device, but it is clear that it offers an excellent means of preventing a party boss from "swinging" the delegation of the State in a National Convention away from the Presidential candidate really desired by the majority of the party.

Into the minute details of the conduct of the direct primary in the various divisions of the State, with the careful provisions for a correct registry list, and the full opportunity of putting names on the primary ballot by petition, we cannot here go. Suffice it to say that the Geran bill sets out to do in complete fashion what public opinion in New Jersey has long been demanding—that is, to provide the means by which the electors may, if they choose, exercise complete control over party nominations and conventions. As regards the election of United States Senators, an approach toward direct election is made, though not as close as that adopted in Oregon. Candidates for the Assembly or the State Senate may sign either one of two statements, the first promising to vote for the candidate for the United States Senate who has received the highest vote in his party primary; or the second, declaring that he will regard the primary vote as only a recommendation which he is at liberty to disregard. Here, again, the people can, if they will, not only indicate their choice for Senator, but compel the Legislature to adopt it.

In the matter of ballot reform New Jersey has lagged behind most of the other States. Each party has had its official ballot, which, moreover, could be freely distributed by party workers. Now that is all to be changed. There is to be but one blanket ballot, with the names of all candidates for any office grouped under it—a party designation being printed after each name—and the giving out of an official ballot is made a misdemeanor. A provision is made, however, that sample ballots, like the official ballot in everything except the color of paper, are to be mailed to every registered voter. Such sample ballots are, of course, purely for information, and cannot under any circumstances be voted. If the Geran bill contained no other improvement than this, it would warrant the hard fight which Gov. Wilson and his supporters in the Legislature have made to pass it.

THE SMALL BANK ACCOUNT.

There has of late arisen a somewhat animated discussion, especially in families of moderate means who keep small bank accounts upon which to draw checks for household payments, over the intimation by their banks that the account cannot be continued unless the deposit is maintained at a stated amount. Sometimes the intimation comes in the form of refusal to open the account unless such a stipulated minimum can be assured. More often it takes the shape of a notice that the average deposit account is too small, and that unless it is maintained at or above a specified figure, a monthly charge will be imposed for carrying it. In some of these notifications which have come to our attention, the bank declared its purpose of charging a dollar a month for carrying deposit accounts which averaged below $200. This, in the eyes of most people, would be equivalent to notice of withdrawal; for the proposal that a depositor shall pay 6 per cent. on his own deposit, for the privilege of having it carried, is financially preposterous.

Now such banks as may have taken this action had their reasons, and they did not do it merely because they dislike to have small depositors on their list. One hundred separate deposits of $200 each produce a loanable fund of $20,000, and no banking institution is indifferent to even so relatively small a sum for money market uses. The position of the banks as we understand it, however, is that the bookkeeping, the clearing and collection of checks, and the other incidental expenses of the office are as applicable to a small account as to a large one, and that where (as in most household accounts) the number of separate checks drawn on the account bears exceptionally high proportion to the average credit standing at the bank, the performing of these functions may cost more than the bank could possibly earn by lending out the deposit.

The case, thus stated, is unquestionably strong, but it omits some other considerations. If a bank had no deposit accounts except such as have been described, it certainly could not go on doing business. But if the question concerns a bank the bulk of whose accounts are commercially profitable, but which also carries some small deposits which are not remunerative, the matter wears a slightly different aspect. The late Frederic D. Tappen, one of the shrewdest judges of banking practice in his day, took ground very strongly in defence of accepting small deposits. There was then, as now, a disposition to figure up statistically whether such an account insured a profit to the bank or not, and if not, then to refuse to open it. Mr. Tappen criticised this conclusion on two grounds—one, that a small deposit account to-day might be a large one next year or some years later, and that the business of a bank was to look for customers; the other, that the use of a given bank's checks, in the payments even of a small depositor, was the best of all advertisements for that bank, and the cheapest also. The bank may make no profit from the account on which are drawn the checks to settle butchers' or bakers' bills, but it may, in the course of time, get the butcher or baker himself as a depositor.

We would not push this second argument too far; it would apply to a small bank in the residential district where it would hardly apply at all to a powerful Wall Street institution; but it is after all to these smaller banks that the matter at issue has most reference. Deposit banks doing business of

that nature have a peculiar field, which cannot be cultivated altogether on the ideas accepted elsewhere. We have in mind the case of a small bank in an uptown district of this city, and of the safety of a household account in which a certain business man was feeling doubt, because of the Robin incidents. His account, as it happened, varied considerably; on the average it was neither large nor small, as such things go. It had been low, however, during several months; which inspired the bank to notify him that unless he at once increased it, the charge of a dollar a month would be imposed. One may imagine what the depositor's face expressed when the notice reached him. It is possible that in that case the loss of this one account, which naturally occurred forthwith, was followed by loss of other and much more profitable balances.

There are obviously two sides to the question, neither of which can be confidently measured by extreme cases. There is undoubtedly a tendency among depositors, in these days of competition between trust companies, savings institutions, and deposit banks for obtaining accounts which will rest for a reasonable period undisturbed, to leave the bulk of a credit fund where it will draw some interest, and to cut down to the smallest convenient size the deposit account which gets no interest, and on which household checks are drawn. It is not unreasonable for a bank, under such conditions, to point out to a depositor that it must have at least a working margin in a given deposit, if it is to be expected to do the work involved in facilitating transaction of affairs by check. We imagine that most small depositors, thus appealed to, would see the justice of the position. But pressure in such directions may easily be applied unwisely and too far, and the bank rather than the depositor be the sufferer in the long run.

THE OLDEST LIVING RULER.

Ninety years of age, beloved of his people over whom he has ruled with kingly power since June 13, 1886, but only a prince—such is the Regent Luitpold of Bavaria. He wears no kingly crown, because King Otto still lives, without a vestige of reason, in a castle where little of royal dignity surrounds him, and because there is nothing in the Bavarian Constitution to permit the deposition of the sovereign. But if he lacks the crown and title, it has long been Prince Luitpold's fortune to possess in rare degree the affection of his subjects. For the Regent embodies the rugged virtues of his people. They have thought of him as of one of themselves, though far above them, and a father to them all. They have known, through innumerable instances, of his kindness of heart and the generous simplicity of his nature. His love of hunting, persistent even in age, appeals to them; pictures of him in simple mountaineer's costume, with his gun in his hand, are in every village tavern, and they have heard stories without end of his unaffected comradeship not only with his own old friends, but even with his trusted servants and guides. They remember that he fought well for Bavaria, as inspector-general of its army, against the French, when no one believed that he would head the state in place of the handsome young sovereign who met his death in Starnberg Lake.

Prince Luitpold was sixty-five years old when he assumed the regency—an age at which a man's character seldom undergoes further changes. This explains, perhaps, why the simplicity of his ways was unaltered and why his policies were readily foreseen. The very geniality and kindliness of his nature made him a man to seek no strife, but to endeavor to procure harmony by compromise and by unceasing efforts to reconcile the warring. The great desire of his life has been peace and quiet, and it must be admitted that in some respects Bavaria has suffered thereby. Even in one of the subordinate German monarchies, it is highly desirable that the ruler should have a fighting edge, since the forces of reaction are sleepless. So in Bavaria it is undeniable that, while the Prince Regent has taken but little interest in politics, the ultramontane leaders, on the contrary, lost no time in getting more and more control of the government. There was a genuine reason for calling Bavaria a "minister-republic" in the early eighties and for some time after the death of King Ludwig, for the government was actually then a moderate-liberal one. Luitpold's government has run on smoothly enough; there have been no great issues to face and no complicated problems of state to solve. Yet the Centre has gained so steadily as to be to-day the dominating power. It is undeniable, too, that the Regent has had no little suspicion of the Liberals. But with it all he has reigned as a Constitutional monarch, and strengthened the ties of friendship and of government with the Empire, so that even the Liberal press speaks well of him to-day, attributing his political shortcomings to age and lack of political skill rather than to any deliberate attempt to turn Bavaria over to the Clericals.

When it comes to what Luitpold has done as patron of the arts and crafts, as part moulder of the Munich of to-day, there are no dissenting opinions. The simplicity of his nature forbade his posing as a great art critic or connoisseur, but his interest in everything relating to the art world has been unceasing and unmarred by any particular fads or special crazes. All through his regency, the capital of Bavaria has grown richer and richer as an art centre, just as it has grown from one of the poorest of the European cities to one of the most prosperous and advanced. Munich's debt to him is great indeed, and it is interesting to note that his last large public gift was devoted to art and artists. It is also characteristic of him that, refusing any costly and elaborate celebration of his ninetieth birthday, he expressed only one wish—that when it came, on the 12th of last month, the public should, if it pleased, establish a charitable fund the income of which should be used for the common welfare and for philanthropic purposes.

He has truly shown, as has recently been pointed out by the Berlin press, that if the kings of the minor German states are excluded by the Empire from participation in the politics of the world, there is none the less a great field for most useful activity and leadership within their own domain. An honest, simple, straightforward, upright man in whom there is nothing that is bad or false; an economical administrator who keeps his affairs in a condition wholly beyond criticism—this is the verdict to-day even of the press politically opposed to Luitpold. And all over Germany people are quoting the speech he made but a day or two before his birthday, when he declared that among all the emotions crowding upon him his dominant feeling was for the German Empire, to the welfare of which

he had conscientiously devoted all of his thought and all his actions. Twenty years ago or so the Kaiser wrote in the Golden Book in the Munich town hall: *Suprema lex regis voluntas.* Some years later the Prince Regent wrote in the same book his guiding motto: *Salus publica suprema lex.* That he has truly lived up to this his popularity attests, and the Kaiser exaggerated but little when he described the oldest living sovereign on his birthday as "the incarnation and model of all the princely virtues."

THE QUESTION OF EDWIN DROOD.

LONDON, March 22.

Two strange little new books have enlisted the curiosity of a public not, indeed, numerically large, but intellectually respectable. The first is "About Edwin Drood" (Cambridge University Press), and is from the classic pen of Dr. Henry Jackson, regius professor of Greek in the University of Cambridge. Five or six years ago, when I published "The Puzzle of Dickens's Last Plot," another very distinguished Cambridge scholar reviewed it. He said that as to "The Mystery of Edwin Drood," most people on the Cam were indifferent, while many asked "Who *was* Edwin Drood?"

Many persons, but among them, I think, no lawyers, have attempted to discover the way in which Dickens meant to solve his mystery. The late Mr. Proctor, a scientific character, argued in favor of the survival of Edwin. Jasper was not to succeed in murdering his nephew, though he believed that he had succeeded, and Edwin was to "come up smiling" in the last round. Mr. Cuming Walters, on the other hand, argued that Jasper did murder his nephew, and that the mysterious amateur detective, Datchery, was a very young Eurasian girl, Helena Landless, disguised in a white wig, a blue *surtout*, and gray trousers. If this was Dickens's intention, he was *felix opportunitate mortis.*

Dr. Jackson began by doing what no other student had done, and what a scholar would naturally do. He consulted Dickens's manuscript of the story at the Victoria and Albert Museum: with the story are "plans." They are written on a broad sheet of paper; on the right hand are the chapter headings, much as they appear in the published book, with very brief notes of the contents. On the left hand are other notes, not numbered, and these, or some of them, appear to me, under correction, to be earlier than the notes beneath the chapter headings. In the notes on the right hand, Dickens put questions to himself, such as "continue the opium woman?" of the first chapter. He answers "no," and twice, to these notes on the left hand, he adds the words "done already." Chapter xix is headed, on the right hand, "Divers Flights," which Forster (after Dickens's death and before the chapter was published) changed into "A Flight." The chapter is concerned solely with the flight of Rosa from Cloisterham to her guardian in London. On the left hand (the earlier, I think), Dickens had written "Disappearance of Drood. THE MYSTERY," and later had written "Done already"—namely, in chapter xvi. His original idea seems to have been to make Edwin and Rosa disappear almost simultaneously. Moreover, Dickens had originally meant to put chapter xviii—"A Settler in Cloisterham" (the appearance of the detective Datchery)—after the chapter which now follows it, in which Jasper proposes to and terrifies Rosa, and causes her flight to London.

Now, Dr. Jackson, believing that Miss Landless is Datchery, and seeing that she could not set out in her disguise till after chapter xxii, thinks that Dickens, had he lived, would have placed the chapter introducing Datchery after the present chapter xxii. In that case it would be chronologically possible for Datchery to be Helena. As matters stand, Dickens's reputation for taste and sense is safe: Helena cannot be Datchery. On the other hand, when Dickens wrote these "plans" (at whatever moment he did so), I think that he meant the murder to be successfully achieved. But, to judge from certain indications, he may have changed his mind, and I rather lean to the opinion that he *did* change his mind. He had committed himself to nothing, and the question of his final decision is insoluble; my own opinion is wavering.

Another curious problem is raised by a little book, "The Adventure" (Macmillan), which has already been rather widely read. In 1901 the narrators, two ladies whose real names and highly respectable positions in life are well known, paid a visit on an August day, after luncheon, to *le petit Trianon.* They knew nothing about the house except that Marie Antoinette used to amuse herself there in a rural way. They went through places that no longer exist, they met persons in the costume of 1789; one of them saw, close beside her, and the other did not see, a lady who resembled a portrait of Marie Antoinette; but some days passed before each told the other that the Trianon seemed to be "haunted." Months passed before they spoke to each other freely on the subject. In January, 1902, one of them went alone to the place, heard music which was not being played, and felt as if she were the centre of an invisible but audible crowd of courtiers.

It is an infinite pity that they did not, in August, 1901, and January, 1902, write down their stories, and leave them in the hands of the Society for Psychical Research, while their memories were fresh, and while they were still ignorant of the local topography of the Trianon as it was in 1789, and of the costumes then worn by the gardeners and people about the court. In place of doing that, they have been making researches in old maps and old royal account books, and find that what they saw was what in 1789 they would have seen. This affords to the skeptic an opportunity of saying that their later acquired information has unconsciously colored their memories of their adventures. Their first statements, in each case, are followed by the date "November, 1901," but no date of the day of writing is given in either case. By the account of the lady who gives the first account, it did not occur to her that she had seen anything out of the common till several days after her visit to the Trianon. Even now, nothing is told us about the costume of one man, who, if the narrative is absolutely correct, was not a man of mortal mould, and must, if a shadow of 1789, have worn a dress that could not but excite attention and surprise. Yet he was, at the moment, accepted as a servant of the year 1901. One lady felt deeply depressed; the other felt as if she were walking in a kind of dream, "dissociated," as psychologists say. There was all the more room for errors of impression and of memory.

A book of very great interest to scholars is Alexander Shewan's "Lay of Dolon" (Macmillan). Mr. Shewan is a student of Homer, and of everything that has been written about Homer in Germany, America, France, Italy, England, and modern Greece. He takes as his text the tenth book of the "Iliad," the "Doloneia," at which every passing higher critic throws his stone, finding the language, versification, and general matter late and spurious. Mr. Shewan proves that the faults objected to—the vocabulary, metre, grammar, the use or non-use of the digamma, in fact, all the grounds of objection—are just as common in the supposed most ancient books of the "Iliad" as in the tenth book. He defends the archæology; he "rages like a fire," as Homer says, among the hosts of the adverse critics; showing up their logic, their statistics, their inconsistencies, with ruthless patience and very great erudition. Probably they will take no notice of a work so terribly damaging, an impeachment so humorously severe of the doctrines termed "scientific." Happily, in Germany and in Holland there are old scholars and young scholars who have shaken off, or have never yielded to, the glamour of Wolf and his successors.

ANDREW LANG.

SWISS NOTES.

NEUCHÂTEL, March 25.

At the coming international exposition in Rome the Swiss intend to display some interesting archæological specimens to illustrate the former relations between Helvetia and the imperial capital. While it is impossible to transfer to Rome the valuable collections of Zürich, Avenches, Lyon, and other Swiss towns, the Swiss national museum has been charged by the government with the task of making the exhibition as complete as it can well be made. The idea of the directors of the museum is to show what the Roman Helvetia was. This is to be done, however, by means of photographs, plaster casts, and copies.

Previous to his departure for Constantinople, John Mott addressed large audiences in the principal Swiss towns. At Geneva the meetings were held under the auspices of the university faculty, and the hearers were chiefly students representing almost every civilized country. Mr. Mott spoke in English, but was aided by an interpreter. Among other things he said:

> You have here many Russian students, and this puts you with Tokio, Paris, and Oxford. You have many Orientals, and you can reach by your influence, besides the Turkish and Slavic, the neo-Latin nations, and through them those of South America.

At the last meeting Mr. Mott was introduced by Dr. Werner, the new professor of philosophy at Geneva, who spoke of Christianity as "the most important flight of idealism which has raised man to a higher plane."

Like Athens, Geneva is always eager to hear or to tell some new thing. Nevertheless, it gave a cold reception to Madame de Polozow, a Russian lady who came to address her compatriots in the university with regard to political conditions in their native land. After making a sort of apology for the faults of Russian administration, she attacked those Russians who go to foreign lands in order to engage in a revolutionary propaganda. The large Slavic population of Geneva is by no means in sympathy with such conservative sentiments, and a number of Russian students, both male and female, left the hall to show their disapproval of this *vox clamantis*.

A posthumous work of J.-J. Gourd, formerly professor of philosophy at Geneva, is entitled "Philosophie de la Religion." It has been published at Paris, with an introduction by Emile Boutroux. During his lifetime Gourd had considerable success as a teacher. It is doubtful whether this book will be much admired by students of either religion or philosophy. He divorces religion from science to such an extent that it is hard to see how there can be a philosophy of religion unless philosophy is unscientific.

Definite action has been taken at Berne to establish a "bureau of languages." A committee has been formed with M. Frey, a former federal councillor, as president, and Karl Schneeberger as secretary. Among the members is Professor Ostwald of Leipzig. A memoir has been addressed to the Swiss Federal Council requesting it to invite the governments of all civilized states to take part in a conference which shall study the question of adopting "a universal auxiliary language."

The arrest at Berlin of Mario Segantini, accused of selling paintings of his own to which he had forged his father's name, recalls a singular and almost tragic family history. Giovanni Segantini had two sons. He was himself a successful artist who lived for many years in the picturesque Grisons region in Switzerland. His eldest son gained a strange sort of fame by his eccentric and morbid art, and died by his own hand. The younger son, who has been arrested, is notorious both in Europe and in America. Among the mountains of his Swiss canton he qualified as Alpine guide. He is a good horseman and an accomplished boxer. In Central America he acquired fame as a yachtsman. He studied art at Milan and Vienna. At the Palais des Beaux Arts at Milan he exhibited a painting which was much admired and for which an offer was made; but for some reason he destroyed the picture, saying that it did not satisfy him. He then attempted to imitate the paintings of his clever father. When a connoisseur in Berlin declared that the young man had no talent, Mario made a wager that he would "rouler" the critic. He not only imitated the work of his father, but forged the latter's signature, writing the "G" so that it might have been mistaken for another initial.

Rossel's "Histoire de la littérature suisse," which has already been referred to in the *Nation*, has given rise to much idle debate. M. Rossel has a high reputation here as jurist and statesman. His book, although very complete and thorough, is an encyclopædia rather than an appreciative and critical review of the subject. Swiss men of letters are still discussing the question whether there is a Swiss literature independent of the literature of adjacent nations. There seems to be not much more than a war of words. Was the French Calvin a Swiss or a Frenchman? Was the Swiss Rousseau a Frenchman or a Swiss? When Eduard Zeller wrote at Zürich before going to Tübingen and Berlin, was he Swiss or German? Is Rod to be reckoned a Frenchman because he knew his Paris, or as a Swiss because he knew the Vaudois peasantry so well? A Tessinois who writes in Italian may be Swiss, but his work is a contribution to Italian literature. It is plainly the language of the author, and not his race, which determines his place in literary history. Longfellow and Cooper were not North American Indians; and Booker Washington's admirable writings belong to English literature. But Rossel would insulate the literature of Switzerland and ask the writers of his country to put a barricade about themselves to protect them from foreign influences.

A very elaborate treatise on the science of education has just been published at Geneva. It it entitled, "Le Problème pédagogique, essai sur la position du problème et la recherche de ses solutions." It is an ambitious volume of nearly six hundred pages. The author is Dr. Jules Dubois, a graduate of the University of Lausanne, who has had years of experience in the Swiss high schools. His book gives a brief history of pedagogy, followed by an exposition of the author's educational theory. His discussion is divided as follows: the philosophical problem or question of the ideal, the technical problem or question of the programme, the scientific problem or question of the method, the pedagogic problem or question of the educator. He writes from the "voluntarist" point of view, as the following passage from his book will show:

> In spite of all theories of integral education that may be elaborated, in spite of efforts made to give to instruction a more practical character, the official education of our European countries has become, and remains, overweighted with intellectualism. The idea that the more one knows the more social value one has, the idea that one cannot be a so-called cultivated man without going through a series of scholastic cycles, each of which represents a programme wider and more detailed than the preceding one, is not this to-day in many minds a pedagogic dogma which cannot be attacked without incurring the condemnation of many intelligent people?

To this it might be answered that no one can ever know too much, and that practice of whatever sort does not depend altogether on the teacher.

NEWS FOR BIBLIOPHILES.

The price paid in the Ashburnham sale for the Gutenberg Bible was £4,000, not £2,000, as was stated in this column last week.

A list of the Incunabula included in the first Hoe sale arranged by countries and cities is printed, filling four pages, at the end of the catalogue. Among other important books from German presses, after the great Bible, are the "Epistolæ et tractatus" of St. Jerome, printed by Peter Schoeffer at Mainz in 1470, and on vellum; the "Catholicon" of Balbus de Janua, printed at Strassburg by the "R" printer, now identified as Adolph Rusch, son-in-law of Mentelin, to whose press these books used to be ascribed; the first edition of Richard de Bury's "Philobiblon," printed at Cologne in 1473 by a printer not certainly

identified; and the first edition of the "Imitatio Christi," printed by Günther Zainer at Augsburg about 1471. The long list of early books from Italian presses begins with the Lactantius of 1465, from the first press in Italy, that set up by Sweynheim and Pannartz at the Monastery of Suhlaco, and the Apuleius of 1469, by the same printers, after their removal to Rome. Among twenty books from Venice presses before 1500 are: "De Civitate Dei," printed by John and Wendelin of Speier in 1470, and on vellum; the Pliny of 1472 from Jenson's press, and also on vellum; the first edition of Euclid (1482), printed by Ratdolt, and eight books from the press of Aldus Manutius, among them being his most famous book, the first edition of the "Hypnerotomachia Poliphili." The first edition of Homer, printed at Florence in 1488 by Lorenzo Rossi, and "De Claris Mulieribus," with many woodcuts, printed at Ferrara in 1497, are other notable Italian books. Among French incunabula we may note "La Mer de l'Histoire," Paris, 1488; and "La Rommant de la Rose," undated, but about 1497. Three books from three presses at Basle, Switzerland; two books from Gouda and Haarlem presses in Holland; Boccaccio's "De la Ruyne des Nobles Hommes et Femmes," printed at Bruges by Colard Mansion in 1476 and the first book from his press with a date, are Continental incunabula.

Besides "Le Morte d'Arthur," from Caxton's press already noted, this first portion of the library includes the first edition of the "Book of St. Albans" (1486), one of two perfect copies known; the first printed collection of English statutes, from the press of William Machlinia about 1482, and one or two other books printed in England before 1500. The superb copy of "The History of the Noble Helyas Knyght of the Swanne," from Wynkyn de Worde's press, is of later date (1512), but is one of the most valuable of early English printed books. Besides being the only known copy of the book, it is printed upon vellum, and is said to be the only book so printed by Wynken de Worde. From this copy the Grolier Club made a facsimile reprint in 1901.

An Index to the books remarkable for their bindings has also been added to the Catalogue. This shows the peculiar richness of the Hoe library in Armorial bindings, especially those of French origin. In this part alone are described no less than four books from the library of Jean Grolier, including Heliodorus's "Æthiopicæ Historiæ" (Basle, 1552), preserved in a morocco case, under glass, and considered one of the finest known specimens of bindings done for this famous early hook-collector. There are books from the libraries of Francis I, Henry II and Diane de Poitiers, Henry III, Louis XIII, Louis XIV, Charles X, Catherine de' Medici, Marie de' Medici, Marguerite de Valois, Anne of Austria, Madame de Pompadour, Count Hoym, Jacques Auguste de Thou, and many other notables. The list of English hindings is not so long, hut royal copies, formerly in the libraries of Henry VIII, Queen Elizabeth, Charles I, Charles II, James II, Queen Anne, George I, and George III, are included.

There are also two "chained books" and several specimens of silver bindings of Dutch, German, English, and Russian workmanship.

Mr. Hoe never collected Americana systematically nor with much enthusiasm, although the library contains a large number of the rarest and most-sought-for hooks relating to America. From the N. Q. Pope library he selected a few first-class rarities, among them the uncut, large-paper copy of Smith's "History of New York" (1757), the New York Charter of 1719, John Norton's "Redeemed Captive" (1747), Mason's "Brief History of the Pequot War" (1736), and Simcoe's "Journal of the Operations of the Queen's Rangers" (1787), all of which are included in this first sale; but the larger portion of the rare Americana came to him at the piecemeal dispersal of the collection of the late Charles H. Kalbfleisch. From the latter source he procured the uncut copy of Denton's "Brief Description of the Province of New York" (1670), Winthrop's "Declaration of Former Passages and Proceedings betwixt the English and the Narrowgansets" (Cambridge: Stephen Daye, 1645), and Champlain's "Des Sauvages" (1603), the three most valuable American items (prohably) in this first sale.

The Columbus letters are not included here, nor is the very rare Vespuccius "Lettera di Amerigo Vespucci delle Isole nuouamente trouate in quattro suoi viaggi" (n. d. but about 1506), of which the Kalbfleisch-Hoe copy is the only one in this country. Three of the earlier printed accounts of Vespuccius's third voyage are included, one printed at Paris hy Jehan Lambert, a second without name or place of printing, and a third (dated 1605) from the Strassburg press of Mathias Hupfuff. All three are exceedingly rare. Richard Eden's translation and enlargement of Peter Martyr's "Decades" (1555), the first collection of voyages printed in the English language, is always a notable book, though not of extreme rarity. The same may generally be said of Hakluyt's great collection of Voyages (1598-1600), hut Mr. Hoe's copy contains the rare genuine map lacking in almost all copies.

Among pamphlets on early Virginia we may note the "Nova Britannia" (1609) and "The New Life of Virginia" (1612), hoth ascribed to Rohert Johnson; Hamor's "Present Estate of Virginia" (1615), and Copland's "Virginia's God be Thanked" (1622). But few early New England tracts appear in this sale. Besides the Winthrop noted ahove, there are Wood's "New England's Prospect," the second edition (1635); Gorges's "America Painted to the Life" (1659), and Hubbard's "Narratives of the Troubles with the Indians in New England" (1677). There are several very rare New York pamphlets, both Dutch and English. Among the former are the first edition of Van der Donck's "Beschryvinge van Nieuw-Nederlandt" (1655), Vrics's "Korte Historlende Journaels" (1655), and the anonymous but important "Breeden Raedt" (1649), and "Kort Verhael Van Nieuw Nederlants" (1662). Wooley's "Two Years Journal in New York" (1701), and Colden's "History of the Five Indian Nations depending on the Province of New York" (1727) are, after the Denton, among the most valuable English books on the Colony. The first Directory of the City of New York (1786) is another very notable New York item. No copy has been sold at auction since 1886, when Morreli's copy (now in the library of Columhia University) brought $100. A copy has since been sold privately for ten times this sum.

Correspondence

A NOTE ON BOTTOM THE WEAVER.

To the Editor of The Nation:

Sir: Nick Bottom and his "crew of patches, rude mechanicals," are acknowledged representatives of the English artisan of Shakespeare's time. Prof. C. W. Wallace has shown that Shakespeare resided with an artisan, Christopher Mountjoy, wigmaker. What is more natural than that Shakespeare should depict the artisan whom he best knew, and that he should make him chief of the mechanicals, disguised as "the weaver"? Bottom shows, for a weaver, strange familiarity with heards:

> I will discharge it in either your straw-colour beard, your orange-tawny beard, your purple-in-grain heard, or your French crown colour beard, your perfect yellow. (I, ii, 95.)

Who, save a wig-maker, would rattle off glibly such trade terms as "orange-tawny," or "purple-in-grain"? They have the sound of a catalogue of Mountjoy's stock-in-trade. It is Bottom also who arranges that Snug's head shall appear through the lion's mask, and who instructs the others to "Get good strings to your beards." (IV, ii, 35.) Perhaps Shakespeare is ridiculing a tendency of Mountjoy to assume, among his fellow-artisans, a knowledge of stage-craft, because, forsooth, an actor and playwright resides in his house.

This assumption involves one difficulty: the commonly accepted date of this play is 1593-95, and there is no proof that Shakespeare lived with the Mountjoys before 1598. To admit the assumption we must have a later date for the play, or an earlier date for his residence at this place. The latter presents little difficulty, for the statement of Shakespeare which sets the date 1598 refers to his acquaintance with both Mountjoy and the apprentice Bellott, who came to Mountjoy in 1598. Nothing is said, naturally, of any earlier acquaintance between Shakespeare and Mountjoy; therefore it is certainly as fair to assume an earlier acquaintance as to deny it. Any identification of Bottom as Mountjoy would tend to establish Shakespeare's residence with Mountjoy hefore 1598.

T. G. Wright.

Yale University, March 25.

"LE FAKIR."

To the Editor of The Nation:

Sir: There lics on my tahle, as I write, an eighteenth century French pamphlet, gray with age, and still in its original cover of light brown paper. It is not of the greatest importance, but it has relations to an extraordinary character and is in itself a document of some interest in the history of comparative literature. The title page reads:

> Le Fakir, conte . . . Tantæne animis cœlestihus iræ! Virg. Æneid, Lih. I, vers. 15. Prix Douze sols. [Monogram] A Constantinople, de l'Imprimerie du Muphti. M.DCC.LXXX. 8vo, pp. 24.

On the half-title of my copy is written "De la Part de L'Editeur," followed by an elahorate letter or monogram of fantastic interlacings intended to represent the initials—or some of them—of Alexandre Balthazar Laurent Grimod de la Reynière. In the

"advertisement" we are told that the author was a young officer in the army, and that it was published without his knowledge, a MS. copy having been communicated by a friend to a Parisian man of letters. The "Editeur" also announces his intention of issuing three other works, one of which is the "Réflexions sur le Plaisir, par un Célibataire," *i. e.*, by Grimod de la Reynière.

The story has nothing in common with Voltaire's well-known conte except the title. The theme is thus expressed in the opening verses:

> Coupable orgueil, source de tous nos maux,
> Toi qui perdis notre commune mère,
> Que de forfaits, que de crimes nouveaux
> Tu fais encore éclore sur la terre!

The Fakir, who has lived in the desert for more than a generation and has become renowned for sanctity and austerities is tempted by the devil to incontinence, kills the victim of his lust in order to conceal his first crime, and when detected agrees to worship the devil if he will rescue him from death. The devil agrees, but the Fakir when he has thus blasphemed his own religion, is left to the executioner. The writer cites as his source "un Auteur Tartare."

This story of the Santon Barsisa appears earlier in English as No. 148 of the *Guardian*, probably written by Sir Richard Steele. He professes to have found it in the "Turkish Tales," by which Sir William Ouseley thinks is meant an English translation from the collection by Petis de la Croix. The story can be traced back to Saadi and Zacaria Cazvini. (See Trans. Royal Society of Literature, I, Pt. ii, pp. 14 and 21.) The tale of the hermit deceived by the devil was known in Europe in the Middle Ages, and four variants of it are cited by Legrand in his account of the mediæval fabliaux. It has also been suggested that "Monk" Lewis found in it the idea of his once famous romance.

"Le Fakir" has been attributed to Etienne François de Lantier, but Gaston de Flotte in the biography prefixed to the "Œuvres Completes" (Paris, 1837, p. v.) denies that he was the author. De Flotte avows his ignorance of the real authorship. Lantier wrote his own epitaph:

> Dans cette tombe protectrice
> Repose un mortel peu connu:
> Il vécut libre, il abhorrait le vice,
> Il aimait la vertu.

There is no doubt that Grimod de la Reynière was the "publisher" of this story, and whether that elastic term might not imply authorship also may be a matter of doubt. The grotesque character of Alexandre Balthazar Laurent Grimod de la Reynière is well known to the loiterers in the byways of French literature. The great apostle of cookery was the grandson of a *fermier-général*, devoted to the "pleasures of the table," who died with a serviette round his neck, choked by that cruel dish, a pâté de foie gras. His father was rich, his mother was a sister of Malesherbes, and a niece of a bishop of Orleans not famous for sanctity. Grimod, their only son, born in 1758, was malformed from birth, as his arms terminated in fin-like appendages. Hands made like that of Goetz von Berlichingen—of iron but covered with gloves of white skin supplied the place of the missing members. He was otherwise good-looking, and was well-educated, but too fond of making fun of his mother's aristocratic airs and pretentions, and of aristocrats generally. He did not fall in with the plans of his parents for his advancement in life, and on their side they successfully opposed what might have been a happy marriage. The unhappy lover became a happy gourmand, and his dinners were soon the talk of Paris alike for their splendor and for the eccentricities of the host. His gallantries, his duels, his suppers in which coffins and funeral ceremonies mingled with the costly wines and elaborate dishes, were the theme of court and city alike. When the elder Grimod stopped the supplies, the son turned coachman, and charged for carrying passengers in the family carriage! Later he turned merchant, if that is the right word, and went from fair to fair with a bazaar. He continued his literary efforts, and while the Revolution was uprooting all the old social landmarks he used the influence which his former opposition to the aristocrats had given him, on behalf of his parent. He did not approve of the Revolution, and had a special grievance against it, for he declared that in all its disastrous years not one fine turbot had reached the market! In 1803 he began the work that has made him famous, the *Almanach des Gourmands*. It continued until 1811, and has given Grimod de la Reynière his special niche in the French Panthéon. His later years were passed at his chateau de Villers-sur-Orge, where his guests were often subjected to strange experiences, rendered possible by secret passages and machines which, however useful in a theatre, are, happily, not usual in a home. In his pleasant retreat in the Department of Seine-et-Oise death made his call upon Grimod de la Reynière and guided him to a place where there is neither feasting nor the giving of feasts—after the fashion of Grimod de la Reynière.

WILLIAM E. A. AXON.

Manchester, England, March 20.

AN INSTANCE OF WORD-MAKING.

TO THE EDITOR OF THE NATION:

SIR: The other day a little girl came up on my porch to play with the baby. By some accident, in tossing down his mother-of-pearl tooth-ring, he contrived to lodge it on one of her outstretched fingers. Then she called out, "See, he has hung the ring on my finger." Then this child of eight put out her two first fingers and said, "Here are my hangers." It struck me as a particularly vivid instance of word-making, of the fashioning of a momentaneous word to suit a passing need. If the word-maker had been a grown person I should have thought no more of it, but for a child to call a finger a hanger, to suit a single occasion, indicated the extent to which language works in us.

The incident set me to thinking about our word for *hand* which the etymological lexica of importance treat with great caution. The strongest statement that they venture is to the effect that some connect *hand* with the Gothic verb *hinthan*, "to seize." This makes hand mean "the seizer, grasper." On the—shall I call it—mechanical side, there is no obstacle to this conclusion. Every single sound in the word *hand* is legitimately accounted for by the derivation from the root of the Gothic verb in question. Why, then, do the lexica shrink from this etymology?

Truly, the etymologists are a curious folk, if I may be permitted, who am an etymologist *ex-professo*, to criticise my own kind, without becoming liable to a charge of arrogance. They are like those other curious ones that strained at a gnat, but swallowed camels.

To begin with, when Gothic *handus* is cited alongside of English *hand*, the etymologists and the readers of dictionaries think that they are giving or learning the etymology of *hand*, while the only conclusion the comparison warrants is as to the great age of the word *hand;* it can be traced to the pre-Germanic period—and no further. The comparison is valuable for word-history, but the only tenable suggestion that seeks to show us the origin of the word is that it is a derivative meaning "the seizer," and cognate with the root of Gothic *hinthan*.

Now, "seizer" is, as such matters go, an absolutely adequate description of the hand, as the momentaneous description of a *finger* as a *hanger* was not adequately descriptive of the finger. So far from stumbling, then, over the definition (which means the etymology) of *hand* as the "seizer," I shall seek to justify it. In Vienna they have the formal word *hand*, identical as it happens with our own, but they say on the streets *Greiferl* "little seizer," in place of *hand*. The adequacy of this affectionate diminutive of the streets, in point of descriptiveness, is reflected in the formal language of science, for, in noting the distinctions between man and his ape progenitor, it becomes necessary to say that both possess a *Greif-hand*, but that in man the *Greif-fusz* has almost totally disappeared. Science has developed the word *Greif-hand* explicitly to describe the function of the hand. But science is not more likely to have given an accurate functional description than our pre-Germanic ancestors. And my little girl, with her "hangers," was, for the nonce and for her need, as accurate as either. Her description, too, however inadequate, was as inclusive as a large portion of the descriptions that have become crystallized into names. A name is often most partially descriptive, witness the *tie* (on my neck), the *ties* (on my feet, on the roadbed of a railway, about a cotton bale).

EDWIN W. FAY.

Austin, Tex., March 29.

AN OLD SONG.

TO THE EDITOR OF THE NATION:

SIR: I wish, if possible, to recover the words of a song which I read in my youth, and parts of which still haunt my memory. The writer's name I never knew. It is a beautiful specimen of a lost type, as will be seen from one stanza, which I subjoin:

> In their caverned, cool recesses
> Songs for thee the fountains frame;
> Whatsoe'er the wave caresses
> Lisps thy name.
> Greener verdure, brighter blossom,
> Whersoe'er thy footsteps stray
> O'er the earth's enamoured bosom,
> Live alway.

WM. HAND BROWNE.

Rider P. O., Md., March 27.

Literature

STUDIES OF TRANSPORTATION.

Railroad Traffic and Rates. By Emory R. Johnson and Grover G. Huebner. 2 volumes. New York: D. Appleton & Co. $5 net.

Our Home Railways. How They Began and How They Are Worked. By W. J. Gordon. 2 volumes. New York: Frederick Warne & Co. $4.50 net.

The two attractive volumes by Professor Johnson and Dr. Huebner have the active railway man primarily in mind. They are evidently designed to give to the ordinary clerk or even subordinate official of a great railway system, who knows little or nothing beyond his appointed task of the industry that he serves, a broader knowledge of railway operations as a whole. The first volume is devoted to the freight service, the second to passengers, mail, and express. The method of treatment is to describe the organization and management of each kind of service, and the documents used, and to follow this with an account of classifications and rate-making. Experts in the railway field have read and criticised the various chapters, and in consequence the material presented may be accepted as authoritative. The matter is well arranged and set forth with great clearness. Being abundantly illustrated with facsimiles of forms and documents, the books should serve as a valuable guide, so far as they go, to traffic operations.

It is a question, however, whether they contain what the young railway man wants, or at any rate what he ought to have. With the exception of the sections on rate-making, which are largely taken from the work of McPherson, Ripley, and others—for which generous acknowledgment is made—the chapters are almost wholly descriptive. They are merely surface accounts of the methods employed and the forms used, with scarcely a reference to underlying problems; this despite the fact that almost every item printed in a railway blank form is the outcome of a struggle—the solution of some problem, however unimportant, in railway operation. Take for example the subject of the uniform bill of lading. A careful description is given of its provisions, a facsimile is presented, but there is no reference to the long controversy between shippers and carriers of which this document is the result; it can be of little value to a railway clerk to be told that the original of an "order bill of lading" is printed on yellow and the shipping order on blue paper—bits of information which he can pick up by himself after a few days of office practice.

A second criticism relates to the sources of information from which the illustrative matter is drawn. In view of the fact that railways still vary so widely in their methods, far too many references are made to the procedure of one particular railway corporation. It was doubtless more convenient for the authors, but it does not give one confidence that the railway practice of the country has been studied and summarized.

Mr. Gordon's two volumes embody the history and description of the important railway systems of England and Scotland. The illustrations with which the books are generously provided, and which include every form of construction and equipment, will prove of more interest to American readers than the text, for the descriptive matter consists largely of technical and mechanical details which can have only local interest. There is only an occasional reference to traffic and rates, and none at all to problems of regulation. It can in no way supersede Acworth's delightful "Railways of England," written in 1889. Here and there appears an item of interest to Americans. We learn for example that the first Pullmans were introduced into England in 1874 and that their smooth running was responsible for the present style of long carriage with four-wheeled bogies. That the United States is not the only country of speed and hustle is shown by the fact that the Great Northern runs a train without stop from Paddington to Plymouth, a distance of 225¾ miles, in 247 minutes, and that one of the "tubes" is operating trains during the rush hours at intervals of eighty seconds.

A characteristic difference between freight service here and there is revealed by the following description:

> In the old days of leisurely delivery, the orders were large in order that a stock might be kept by the dealers. Nowadays, the railways have so improved their services that goods collected at night are delivered next morning, with almost the certainty of letters. The result is that whereas the dealer used to order in tons, he is now contented with hundredweights, and the packages that have to be handled and booked are twenty times as many. The men behind the scenes in railway work have to be more numerous every year; and the net profit suffers. It is the penalty of efficiency.

Transportation in Europe. By Logan G. McPherson. New York: Henry Holt & Co. $1.50 net.

We have had much experience with the book on American conditions embodying the impressions of the European traveller after a brief sojourn with us. Its frequent misinterpretations, its hasty generalizations, its omniscience, arouse suspicion as to its accuracy and resentment as to its conclusions. It was pardonable, therefore, if we approached with no very eager expectations a book treating of transportation in all the leading countries of Europe, by one who had devoted but six months to study on the ground. The book proves, however, to have genuine merit; it is the outcome of careful and thorough investigation, its conclusions are thoughtful and considerate, and in the main seem sound, its tone is judicial, giving almost no evidence of bias; in a word, it presents a most satisfactory picture of existing transportation conditions in Europe. The author was peculiarly well fitted by training and circumstance to gain every advantage from his stay abroad. After a long practical experience in the industry, and more recently a three-year study of the rate situation in the United States, he was attached as expert to the National Waterways Commission, and had every facility granted him for procuring information.

In the opening chapters a concise history is given of highways, waterways, and railways, in which the situation in each country is brought up to date. In the discussion of present-day relations between the railways and the government clearness is sometimes sacrificed to brevity, so that while the reader gains a good idea of the historical development, he is left with a somewhat indistinct impression of existing conditions. Passenger traffic, freight traffic, government control, and the comparative usefulness of water and railway transportation are discussed in separate chapters. One gathers the general impression that European railways charge higher rates, and that their efficiency is in most respects inferior to that of the railways of the United States. This the author would attribute in part to remediable conditions of operation, in part to the fundamental and perhaps unalterable conditions under which the business is done, in part directly to government management and operation. Yet he grasps fully the difficulties of accurate comparison and is generous in his allowance for differing conditions. For example, in the discussion of German freight rates, after remarking that "freight classifications in Germany are not so pliant as those in the United States," and that "German officials admit that on the whole their freight rates are higher," he says, "In a country where the greatest continuous rail distance is less than 1,000 miles . . . the German system of rates fairly meets the needs of existing traffic."

In view of the recent nationalization of Swiss railways it is of interest to note that the Swiss experience coincides with that of other democratic countries that have made similar experiments. The quality of administration has been impaired by reductions in salaries in the higher grades of the service; rates have been lowered and at the same time the wages of the rank

and file increased, with the inevitable result of a deficit in operation. That water transportation flourishes in all European countries in marked contrast to the situation here, is explained by the fact that the various governments do not permit railway rates to be fixed so low as to endanger water traffic.

One of the most interesting chapters in the book is that on International Rail Traffic, in which is described the effort thus far made toward the removal of restrictions and the development of traffic across national boundaries. In this form of traffic lies the possibility of the application of American methods. A final chapter is given to transportation in England, concerning which the author concludes that the conditions are so different that the problems of interior transportation in England and in the United States are virtually without parallel.

CURRENT FICTION.

Klaus Hinrich Baas. By Gustav Frenssen. Authorized translation from the German by Esther Everett Lape and Elizabeth Fisher Read. New York: The Macmillan Co.

Upon the whole the life of Klaus Hinrich Baas from his birth in the hut of impoverished Holstein peasants to his setting sail for China as head of a large commercial concern in Hamburg varies little from that of a boy born under similar circumstances in any other country and rising from obscurity and poverty to prominence and wealth. But in his manner of working up and in the details of his life the story differs widely from that of a boy of Anglo-Saxon stock. In his essential traits this hero bears an unmistakable family resemblance to Jörn Uhl. But his transplanting from the native acres of his fathers to the cold and alien pavement of the city gives the author opportunity to strike some new notes. He portrays city dwellers of varied social caste and moral calibre, presents a picture of the life within the walls of ancient wholesale houses engaged in foreign trade, and gives us a glimpse of the homes of the merchant aristocracy which in the Hansetowns formed a caste of truly patrician ideals and habits. But as the younger generation of these merchant princes departs from the staid and careful business policies of its forefathers and from their comparatively simple standards of living, the traits transmitted through many generations begin to be held less sacred and the character of the old families is undergoing a change. When the author marries Klaus Hinrich Baas to Sanna Eschen one cannot help feeling that by this infusion of the strong, thick peasant blood he hopes to save a race that has nearly exhausted its vitality. Thus Frenssen can indulge in touching problems dear to his heart; but to a much greater degree than in "Jörn Uhl" and "Hilligenlei," he controls the temptation to preach. Re-reading the book in English confirms the impression which one had in reading the original, that in the delineation of his characters Frenssen has in this work reached his high-water mark. Antje Baas, the hero's mother, who feels so keenly the inherent weakness of the Baas character that she sets out with dogged determination to curb it in her children, is a figure of strong outline, and Kalli Dau, the product of Hamburg's slums, is a remarkably forcible creation.

The translators have bravely struggled with the very difficult task of rendering into English the language of Frenssen, charged with provincialisms where the scene is the country, with the vernacular of the wharves and the gutter where it is Hamburg, yet have not wholly succeeded. The translation contains passages which fail to convey the meaning of the original. Thus when Kalli Dau says of his family "Mit meiner Familie ist nichts los," he does not mean "There's nothing the matter with my family" (p. 28), but "My family is good for nothing." When he says that his stepfather "sitzt im Buddel," he means far more than that he is "a regular bum"; he alludes to his being locked up. His forceful characterization of his mother, who instead of cooking proper meals goes "Schuldern und Schandiren," is also very poorly rendered by "Cheating and nastiness are what she lives on" (p. 47), instead of "She slouches and loafs about the street."

Robert Kimberly. By Frank H. Spearman. New York: Charles Scribner's Sons.

That story-writing should now have become so popular a trade with us entails certain disadvantages and even perils. A citizen may begin the business quite honestly and innocently, aiming to turn out a maximum of marketable stories, short or long, by a given date, as, in another "line," he would be turning out shoes or cotton cloth. He has no illusions about his work: it is an output, a commodity, and that is all. If he can sell it, it is worth making. He does not worry about the quarter in which his market may be found. He is not a pearl-merchant—he frankly grows turnips for his swine—the fair thing from the swinish point of view.

But the tale-wright is seldom permitted to remain in this simple and virtuous state. His neighbors take to calling him "Author Jones"; his publisher asserts that his fiction is art of a high order; and he is lost. He ceases the growing of honest turnips, and begins the manufacture of sham pearls. His purpose is an honest one, but the product is a thing of slight value.

No careful reader of current American fiction—let us say of the current novel—would doubt that it "means business" in the highest as well as the lowest sense that may be attached to the phrase. Hundreds of writers are trying their best to produce work which shall be acceptable to the gods (nameless as yet) of current art, as well as the gods of the marketplace. The result is a glut of self-made novelists. To this number the author of "Robert Kimberly" belongs. He has won success as a writer of short stories, and now aspires to work upon the larger scale. There are some real types in this book, if not living persons. The promise of the opening chapters—the promise of a mere tale of domestic scandal in the haunts of the multi-millionaire—is agreeably falsified. The plane of action shifts by degrees from ambition and intrigue to religious emotion. The conclusion ought to be powerful; but it is marred by spectacular accessories. This is a study toward a novel, rather than a novel. The writer has put all his muscle into the effort; but the creaking of bootstraps is distinctly audible.

Keeping up with Lizzie. By Irving Bacheller. New York: Harper & Bros.

Mr. Bacheller's fancy deals habitually with a blend of rustic humor and unabashed melodrama—that formula of "The Old Homestead," "Shore Acres," and like dramas, which so doth take our Lizas and our Jims. The central figure in his present scene is a country lawyer, one of those professionally dry and droll rustic philosophers who can trace their American ancestry much farther back than a David Harum or a Hosea Biglow. This one is a man of cultivation who loves the vernacular, so that his wit has a double edge. He is, one sees at first glance, the good genius of his community, has his finger in every pie, for the good of the pie. Particularly in need of his care are two young should-be lovers. Lizzie is the daughter of a prosperous grocer who in an unlucky moment begins to aspire for his child. Fine clothing, a fashionable school, and association with the children of the rich bring new and increasing burdens on the luckless Mr. Henshaw. Lizzie becomes a symbol of the American spirit. As Soc. Potter, the lawyer-oracle, puts it, "The odor of gasolene is in the path of the eagle. Our thoughts are between earth and heaven; our prices have followed our aspirations in the upward flight." The grocer charges more because he has to make more—taxes the community for the luxuries of his offspring. And presently the whole community is following in her steps—"keeping up with Lizzie" to the best of its ability. Mortgages and motors become equally common among the natives: fashion invades households of the humblest villagers. The idea is sufficiently humorous. It is, of course, the function of Lawyer Potter to save

the situation by reforming Lizzie and presenting her to her deserving but outdistanced adorer. Nothing remains for the community but to keep up with Lizzie by reforming itself. An obvious and rather perfunctory touch of sentiment is added in a marriage arrangement for the Hon. Socrates Potter, who is unmistakably leading man in this rural comedy.

The Imprudence of Prue. By Sophie Fisher. Indianapolis: The Bobbs-Merrill Co.

In the days of Queen Anne, it appears, a wife's debts were buried in her husband's coffin. It occurs to a feather-brained fair one of the court, Lady Prudence Brooke, to take advantage of this legal provision and cheat the creditors who threaten her with "the Fleet" by marrying on a Friday a highwayman condemned to die on Monday. The highwayman, however, exerts himself to remain alive—a betrayal of trust which neither the lady nor the reader could possibly have condoned, had he not been immediately converted from the notorious outlaw Robin Freemantle into Robert Gregory de Cliffe, Jacobite agent and political exile. Even so, it requires a whole series of precarious interviews interspersed with final partings and mutual rescues, before the scrupulous gentleman feels himself entitled to carry his wife off to France and the court of King James.

The author is fairly conversant with the period in which she deals—its laws, literature, manners, court intrigues, and fashions in attire. The latest witticisms of Mr. Prior and Mr. Pope are quoted; we see something of a masked ball at Marlborough House, hear some little talk of "Mrs. Freeman and her poor, faithful Mrs. Morley" from the tyrannical mistress of the robes; and disguises are freely improvised out of periwigs, plumed hats, and chairmen's liveries. In her treatment of human nature she is rather less versatile; outside of the rôles assigned them, the characters would be scarcely more distinguishable than uncostumed lay figures.

THE AMERICAN REVOLUTION.

The Beginnings of the American Revolution. Based on Contemporary Letters, Diaries, and other Documents. By Ellen Chase. 3 volumes. New York: The Baker & Taylor Co. $7.50 net.

We doubt if the reader will be prepared for the limited interpretation which Miss Chase has put upon her subject or for the curiously unformed and inartistic way in which she has assembled much of her evidence. In scope her field is Boston and vicinity; in form she has published a kind of glorified scrap-book. All that concerns other aspects of her subject than New England is a negligible quantity, as far as historical value is concerned. Her point of view is always that of Massachusetts, "the wronged province," and her way of approach is always through that which is personal and anecdotal. With the larger problems, the real causes and beginnings of the Revolution, she has nothing to do, and with the actual operation of the British constitutional and administrative systems she has no familiarity. She can speak of a "Secretary of the Treasury" and a "Secretary of War" in England as unconsciously as she can spell Haldimand "Haldiman," Carleton "Carlton," Germain "Germaine," or turn to Thackeray for her knowledge of the Georges or to the tea-tax debates in Parliament for the last word on British policy.

Two volumes are devoted to the events of a single year, 1774-1775, and a volume and a quarter to the incidents and issues of a single day, April 19, 1775. Fifty pages are given over to the Boston Tea Party and twelve lines to the burning of the Peggy Stewart in Maryland. A similar perversion of the historic sense appears in the secondary authorities upon which Miss Chase has depended for her information and from which she quotes with delightful ease and abandon. She can refer to books for children, such as those of Tappan, Tomlinson, Blaisdell, and Channing with the same assurance as to Force's "American Archives," and she seems to know no other general histories than those of Gordon, Morse, Botta, Spencer, Goodrich, and Murray, with the single exception of Bryant and Gay's popular work; while Lossing's "Our Country" and Niles's "Principles and Acts of the Revolution" are virtually eviscerated. Magazine articles, newspaper communications, and public orations are used without doubt or criticism. On the other hand, Miss Chase has brought together a notable collection of primary authorities both in print and manuscript. In one part or another of her volumes will be found the greater part of Andrews' "Letters," Rowe's "Diary," Hutchinson's "Diary," and the contemporary writings of Newell, Stiles, Quincy, Tudor, Bernard, and others. Many extracts are taken from newspapers of the day, from unprinted archives, and town records.

The valuable portions of Miss Chase's volumes are those that present, with somewhat the fidelity of a moving picture, the leading incidents of Boston's history from 1765 to 1775. She has made a real contribution to our knowledge of such events as the burning of Hutchinson's house, the conflicts with the soldiers and the Boston Massacre, the Boston Tea Party, and particularly the march to Lexington and Concord, the retreat of the British troops, and the rousing of the countryside. She has gathered what we must confidently believe is a complete array of evidence bearing on these events; drawing together scores of scattered stories which lingered on in town and county records and in family tradition. These details are arranged in chronological and topical order and in a few of the chapters, notably those on the Massacre and the Tea Party, rise to a high level of description.

All things considered, Miss Chase is impartial, although her sympathies are unmistakably patriotic. Of the Massacre, she can say that "the provocation came about equally from either side," and of the conduct of the soldiery in general, she is inclined to think that the troops showed much patience. She is sparing of comments and expressions of opinion, preferring to let the evidence tell its own story. The very minuteness of her narration dissipates the mists of hero-worship, and we see the insurgent colonials, brave men, indeed, but possessed of the weaknesses to which all flesh and blood is heir.

Studies in Chinese Religion. By E. H. Parker, professor of Chinese at the Victoria University of Manchester. New York: E. P. Dutton & Co. $3 net.

Professor Parker writes in his preface: "The contents of this book may be described, in the main, as the original studies from which a summary was made and a popular work published in 1905, called 'China and Religion.'" That work was not cumbered with "too many references, proper names, and 'intensive' matter generally," and the present volume supplies the lack, giving "vouchers for previous statements of fact made in general terms for popular consumption." But our expectation of a scientific treatise is disappointed. It is true that there is no lack of "references," etc., but the data for the verification of statements are almost wholly wanting, the mass of Chinese names in the text by no means supplying the want. Our belief in the argument rests as before on our general confidence in the author, a confidence which, on the whole, is well deserved. For the rest, there is an absence of scientific method, and the book has been thrown together in haphazard fashion, from the author's collection of studies, and without re-editing. The amount of repetition is extraordinary and annoying; indeed, one does not understand how the proof-reader can have failed to call the author's attention to this persistent defect. Besides, some of the chapters were manifestly prepared for "popular consumption" and are put in to fill out the required number of pages. How else shall we account for a statement like the following?—

> At the Imperial capital Confucius had interviews with the keeper of the Imperial archives, a morose, hermit-philosopher named Lao-tsz, who founded a rival doc-

trine or system of mystics called Taoism, but, as Confucius himself said that he was unable to comprehend those misty teachings, and the very existence of this Taoist philosopher is held by some to be a matter of conjecture, we need not dwell further upon the incident.

This, on p. 204, and more than one hundred of the preceding pages are devoted to Lao-tsz (or better Laocius, as Mr. Parker often writes it, after the Latinized forms, Confucius, Mencius), with an analysis of these "misty teachings," a determined effort to prove the actual existence of the "morose, hermit-philosopher," and an admirable translation of the Tao-teh, the classic which Parker maintains is undoubtedly his production. Finally, in way of adverse criticism, our author is a very matter-of-fact person, with little interest in any form of religion and no pretence of insight into things metaphysical or mystical.

Nevertheless, the book has its value. Nowhere else can one who has no opportunity to study the original Chinese authorities find so good a statement of the points at issue in the controversy over Tao-ism and its founder, or so impartial and complete a summary of all which has been written upon it by European scholars, or so clear and comprehensible a translation of the Tao-teh. Incidentally the reader gets an excellent view of the sources on which Chinese history rests, with the persuasion confirmed that at least a thousand years of the time put down as historic in the standard works on China is legendary.

International Arbitral Law and Procedure. By Jackson H. Ralston. Boston: Ginn & Co. $2.

Within the last one hundred years a body of law and procedure has grown up relating to the functions and operations of international arbitrations. The precedents creating it are scattered in digests in the reports of arbitrations, many of which have never been fully reported, and some of which have been printed in such limited numbers that they are virtually inaccessible.

The author has collected these precedents under appropriate headings and has included the views of arbitrators upon questions arising under the law of nations. The principle of *stare decisis* is not recognized by international commissions, and as to nearly every point of substantive law there is an irreconcilable conflict. This will continue as long as the various nations make use of the faculty given them by Article 42 of the Hague Peace Conference of 1907 to institute special tribunals instead of submitting the dispute to the Permanent Court of Arbitration.

The decisions of the commissions can therefore not be regarded as constituting a body of law, yet they are interesting because they embody the views of some of the greatest authorities on international law, not only on the subjects which are treated at length by text-book writers, but also on points of which no full discussion can elsewhere be found. An instance of this occurs in the disputes growing out of the so-called Calvo clause in concessions. This Calvo doctrine, which takes its name from the well-known South American statesman, absolutely condemns diplomatic as well as armed intervention as legitimate methods of enforcing any or all private claims of a purely pecuniary nature, at least such as are based upon contract or are the result of civil war, insurrection, or mob violence. The great Powers have generally refused to accept this theory in their dealings with South American states. The attempt has been made to incorporate this doctrine in the concession itself by providing that questions arising from the contract shall be decided by the law of the country granting the concession and by its tribunals, and shall not be considered as a motive for international arbitration. It has been held in some cases that such a clause prevented the consideration of the claims by an international commission. The better opinion, however, which is sustained by numerous decisions, seems to be that a subject cannot contract away the right of the sovereign to enter into agreements to submit all claims to arbitration. It is well said by the author that "in this branch of legal science, as has often been the case in other branches, tribunals in their conclusions are in advance of the speculations of the scholars."

Land Problems and National Welfare. By Christopher Turnor. New York: John Lane Co. $2.50.

A more trenchant indictment of the English land system than this has not been penned by any Radical or Socialist reformer. Mr. Turnor is an aristocrat—a member of an old landed family closely allied with the peerage. He is also a Conservative, and he imagines himself an Anti-Socialist. Yet he approves the Fabian Society, all but its Socialist label. He places Mr. and Mrs. Sidney Webb on a high level as thinkers and administrators, and gives high praise to the minority report of the Poor Law Commission, which was largely their joint work. He wishes to see an end of great estates and a fairer division of the land among small holders—either as owners or tenants, with some leaning to tenancy rather than to ownership so long as the tenure is secure—and he is emphatic in his condemnation of the present waste of land and destruction of crops through the devotion of its owners to sport. Mr. Turnor is also opposed to the holding of land in large farms. "In the interest of the agricultural industry as a whole," he writes, "no land-owner should own more than 20,000 acres (of average agricultural land) at the outside, and on the other hand it would be well if it were impossible for a tenant to hold more than 1,000 acres." The absentee farmer Mr. Turnor regards as an injury to agriculture. A man can get the best possible returns from a farm of 500 acres, but if he adds another farm of 500 acres, and puts in a foreman, he has not the same incentive to do his best by it. He may make a net profit of £100 a year by the second farm, and this may be all that he cares to do; but it is not putting the land to its fullest use, as every acre of land in England should be put. What is needed for England is intensive culture, and hundreds of thousands of small farmers, well educated and trained in agricultural colleges and with an active Agricultural Department behind them ready to give aid and instruction. These small farmers should enjoy security of tenure and freedom from the vexatious restrictions concerning cropping and the breaking up of grass land which so many land-owners impose upon their tenants.

It is the land-owners, however, rather than the farmers, who come in for the most severe criticism at the hands of Mr. Turnor. If a land-owner expects a return from the capital locked up in land, at all commensurate with the return on capital invested in manufacturing or commerce, he must regard land-owning as a business. Love of sport, indifference to the real welfare of the country, and inefficient and incapable management of their too huge estates, are in Mr. Turnor's opinion the chief reasons for the present unpopularity of English land-owners. "The great point to keep in mind," he writes, "is that about 80 per cent. of the population has little or no sympathy with the land-owner; in fact, any feeling there is may be looked upon rather as one of hostility." Intelligent artisans, he adds, are, so far as his experience goes, "all very much against the present system of landlordism, and feel it wrong that so much of the land of England should be in the hands of so few men."

These landlords, on whom so much of the welfare of England depends, do not exceed five thousand. The number includes all who have above one thousand acres each: together, they own just about one-half of Great Britain. Instead of entering upon their estates with thorough preparation for a most important and onerous life-work, most land-owners entrust their possessions to a firm of non-resident agents, or, worse still, to a firm of solicitors entirely untrained in farming or estate management. The only interest of the owner is to receive his income and to enjoy the fullest opportunities for sport, and moreover he frequently turns over to

his agents all poor and needy relatives who may be lacking employment. "This is bad economy," remarks Mr. Turnor dryly; "it would be more economical to pension them."

A return to protection is strongly advocated by Mr. Turnor—a return to duties amounting to at least fifteen per cent. on wheat and food stuffs. He has a theory that such duties would tend to eliminate the middleman, and that while prices would be higher, most of the tax would come out of the middleman's profits. He acknowledges that there is nothing now in the way of the organization of farmers in coöperative societies which should do away with middlemen's profits; but he apparently believes that if prices were raised by means of a protective tariff and the farmers were enjoying greater prosperity, the middlemen would kindly consent to be eliminated in order that the consumers might not be too severely mulcted by the duties. There are several other difficulties in the way of a return to protection for which Mr. Turnor fails to indicate any solution. If duties were reimposed on both foreign and colonial foodstuffs, as he advocates, before any of the reforms which he pronounces to be essential had been obtained, the effect even according to his own showing would be to raise the value of land, to swell the rent roll of the present owners, and to increase the tenacity of their hold upon their estates; to make the present slip-shod methods of agriculture of a large proportion of the tenant farmers fairly remunerative at the expense of the population at large, and to remove the incentive to improvement which is furnished by the keen competition they now have to meet.

Notes

The Appletons have in the press the late David Graham Phillips's, "The Grain of Dust," and "The Man with an Honest Face," by Paul Wells.

The first issue of the *American Economic Review*, published by the American Economic Association, has just appeared. This new quarterly, which takes the place of the *Economic Bulletin* and the monographs previously published, contains four leading articles: "Some Unsettled Problems of Irrigation," by Prof. Katharine Coman; "How Tariffs Should Not Be Made," by Prof. F. W. Taussig; "Seasonal Variations in the New York Money Market," by Prof. E. W. Kemmerer, and "Promotion of Trade with South America," by Prof. David Kinley. The managing editor is Prof. Davis R. Dewey of the Massachusetts Institute of Technology.

G. W. Dillingham & Co., who have moved to No. 12 East Twenty-second Street, announce: "The First Law," by Gilson Willets, and "The Man Without a Face," by Albert Bosslère, translated from the French by Florence Crewe-Jones.

Owing to the recent destruction of the New York State Library, the New England Historic Genealogical Society of Boston desires to make public its own great need of a fireproof building; it has the largest and most comprehensive genealogical collections in this country.

The American Philosophical Society, held at Philadelphia, for promoting useful knowledge and founded in 1743, will meet April 20-22.

Andrew Lang has written a book, called "Sir Walter Scott and the Border Minstrelsy" (Longmans), of which the main purpose is to prove that Scott was not dishonest. He does not, of course, address the general public, which has never been seriously concerned about the veracity of the sheriff of Selkirkshire. He aims only to enlighten the austere modern students of balladry who have severely censured the editorial methods of their great predecessor. If what they say is true, argues Mr. Lang, then Scott was a downright liar—no less. The defence is in part a reply to Col. Fitzwilliam Elliott's "The Trustworthiness of Border Ballads," and is occupied largely with "Auld Maitland," "The Ballad of Otterburne," "Jamie Telfer," and "Kinmont Willie." With some show of new evidence, and considerable ingenuity, Mr. Lang, while admitting a liberty larger than current laws allow, insists that Scott did not deliberately attempt to deceive the public. His case as a whole is not entirely convincing, nor at the best does he clear his client of "criminal carelessness" in statement. Ballad specialists will be interested in the three imitation ballads which he presents, with a challenge to Professor Kittredge to point out the infallible signs of their modernity.

Edward Thomas's "Feminine Influence on the Poets" (John Lane) belongs on the shelf with the works of the industrious Mr. Gribble. We have seen of late so many flies tracking from this honey-pot, so much book-making of this seductively facile character, that we know about what to expect under a title like Mr. Thomas's—a loosely organized mass of pretty trite biographical detail, a lush passage here and there, and a grand dearth of ideas. It is a pity that so rich a theme finds no competent historian, no writer of philosophical and historical grasp enabling him to illustrate with the loves of the poets the development of taste and the progress of civilization. A few years ago M. R. De Maulde La Clavière did, indeed, accomplish something of the sort in "Les Femmes de la Renaissance"—a work not without historical purpose and significance. Mr. Thomas unhappily handles his material in the spirit of the dilettante and the gossip.

In the Oxford Editions of Standard Authors Series, Henry Frowde has reissued in two volumes, at two shillings each, William Stebbing's work, formerly published under the title of "The Poets: Geoffrey Chaucer to Alfred Tennyson." In its revised form, the work is called "Five Centuries of English Verse." The first volume extends from Chaucer to Burns; the second, from Wordsworth to Tennyson. Mr. Stebbing has followed the perhaps unfortunately old-fashioned spirit and method of Lamb in dealing with the Elizabethan dramatists. After a life spent with the poets, he has made his own Golden Treasury, consisting of excerpts from seventy-one authors set into the history of his poetical enthusiasms. Books of this character always contain many disputable matters, but, when well written, as this one is, offer excellent browsing.

Sir Norman Lockyer met Lord Tennyson in the sixties, and they were soon drawn together by a common interest in the heavenly bodies as seen through a six-inch telescope in the former's garden. The astronomer was much impressed by the breadth and keenness of the poet's curiosity in scientific matters, and by the accuracy of the scientific figures and allusions in his works. He has now compiled, with Winifred L. Lockyer, a collection of passages from the poems illustrating in a rather special sense the Wordsworthian dictum that poetry is "the impassioned expression which is in the countenance of all science." The volume is entitled "Tennyson as a Student and Poet of Nature," and is published by the Macmillans.

"Essays on Russian Novelists" (Macmillan), by Prof. W. L. Phelps, is a volume of cheerful criticism of gloomy literature, from an enthusiastically appreciative and yet a frankly American point of view. Professor Phelps states (p. 231) that "Russian novelists are a thorn in the side of complacent optimism," but he does not let the "thorn" cause him the least personal irritation. The book, despite a few slips of detail, is thoroughly sane and helpful, and makes the reader wish to turn to the novelists themselves. The essays on the great figures of Russian fiction, Gogol, Turgenev, Dostoevski, and Tolstoy, are superior both in matter and manner to those on their successors, Gorki, Chekhov, Artsybashev, Andreev, and Kuprin. A good "list of publications," by Andrew Keogh of the Yale Library, adds to the usefulness of the volume.

Charles Francis Adams continues his military study of the American Revolution in the Proceedings of the Massachusetts Historical Society (see *Nation*, November 3, 1910, p. 423), by describing the campaign of 1777. If the capture of Philadelphia was the object of Howe, a land march would have placed him before the city in a few days, in spite of any efforts of Washington to prevent it. If he intended to aid Burgoyne, now coming from Canada, his proper course was up the Hudson to meet him. Instead of doing either, Howe put his army on transports and departed on a voyage of some weeks' duration, in which he was entirely outside of active operations, either in aid of Burgoyne or in offensive operations against Washington. Blundering as Howe's manœuvre was, that of Washington was, according to Mr. Adams, equally so, and involved serious dangers. He stripped his army to reinforce Gates, and in that condition he marched against the stronger and better equipped army of Howe, inviting the inevitable defeat at Brandywine. Then, failing to defend the forts on the Delaware, he found himself without power to act. Mr. Adams holds that, occupying a position of vantage, and acting upon interior lines, Washington, as soon as Howe sailed from New York for the South, should have marched his army to the North, crushed Burgoyne, and returning with the combined army, flushed with victory, he could have met Howe on equal terms, with every chance of success, and brought an end to the

war. It is impossible to do more than suggest the subject of this elaborate paper. The vigorous tone of criticism and questioning gives a wholesome challenge to what has come to be accepted as good historical writing.

The Rev. Dr. George Brown, "pioneer missionary and explorer," whose acquaintance with Pacific Islands extends over nearly fifty years, has now brought together his observations in a stout volume, entitled "Melanesians and Polynesians" (Macmillan). He deals especially with New Britain (now New Pomerania), New Ireland (New Mecklenburg), and the Duke of York group (New Lauenburg), in the northwest, and with Samoa in the centre. All these are at present under German control, the northwestern group being renamed Bismarck Archipel. While Dr. Brown's observations are always valuable, his chief contribution to Melanesian sociology is his description of customs on New Britain, on which island there was no white man living when he landed in 1875. His remarks on Samoa and adjacent islands give material in addition to what is found in Turner and other writers; but it is on New Britain life that he goes into greatest detail. Besides the usual features of Melanesian social constitution (class exogamy, cult of spirits, and germinal forms of gods, prayer, taboo, loose political organizations), he describes fully the cannibal habit, the great variety of methods of burial (adjacent districts therein differing notably), commercial customs, secret societies, and ideas concerning the future life. Cannibalism, he thinks, is not due to scarcity of food, and cannibals are not ferocious; some cannibals that he knew were "very nice people." The Dukduk and Iniat Societies have severe ceremonies of initiation, and wield enormous power. The former has a couple of woman members; the latter has images of supernatural beings. Totemic restrictions of food do not exist. There is a regular system of borrowing and lending at interest (shell money is used), and a custom that is nearly identical with the potlatch of our Northwest Pacific Coast: a young man calls together his friends and neighbors, and divides among them all his property and all that he has been able to borrow. After a while they give him greater amounts, and he is enriched (a sort of system of investment). Prices vary according to the relation between supply and demand. The artistic excellence of carved figures in New Ireland (as also in New Guinea and the Solomon Islands) is remarkable. The belief in the existence of mermaids and tailed men brings the native near mediæval Europe in culture. The souls of the dead are invoked for aid, but are not sacrificed to; there are punishments in the other world for niggardliness, theft, and breaches of etiquette. The snake-bridge of Normanby Island (which lies off the southeast coast of New Guinea) recalls the Persian Cinvat bridge: the great warrior passes over in safety; the deformed or ugly is precipitated into the chasm. Altogether, Dr. Brown's volume sets before us a very interesting picture of a nascent Melanesian civilization, apparently indigenous. For what he says of the Melanesian languages he has had help from Codrington and others. Other parts of his work, relating to Polynesia, would have been better if he had been better acquainted with general Polynesian history.

Christopher Hare's "Romance of a Medici Warrior" (Scribner) concerns the brief but adventurous life of Giovanni delle Bande Nere, the son of the still more famous Caterina Sforza, the Lady of Forlì. It is a popular book, of that class which has sprung up and flourished during the last few years, and is seemingly written for the sake of its illustrations. Although less exciting than a Dumas novel, it is usually readable, and it contains a sufficient ballast of documented facts to warrant its being catalogued as history. Mr. Hare devotes the last third of his volume to the life of Giovanni's son, Cosimo I, who is chiefly remembered now as the consort of Bianca Capello. Italian proper names elude the author's proofreading.

The volume on Ceylon, lately published by H. Parker and already reviewed in the *Nation*, has been closely followed by "Village Folk-tales of Ceylon," by the same author (Luzac & Co.). By way of introduction, Mr. Parker gives a realistic description of village life in Ceylon, including accounts of flora and fauna, the life of the farmers, tricks of the snake-charmers, etc., together with a short statement regarding the sources of the seventy-five folk-tales which the volume contains. They are the genuine stories of the Sinhalese, being almost entirely free from foreign influence, and were collected by Mr. Parker himself during his long residence in Ceylon as head of the Irrigation Department. A number of them come from the lowest castes, from whom hitherto nothing literary, even of the simplest sort, has been gleaned. Many of the circumstances alluded to are of social interest, and even of historical importance, as when "Vaedda kings" appear in the stories. As in all collections of folk-tales, there are innumerable points connecting these stories with those of other lands. The author thinks that very few reflect Buddhistic influence. Notes appended to the stories give parallel tales from the Punjab, Kashmir, etc. Other folk-lorists will be able to add a good deal from a wider circle. The author promises to supplement this volume with another shortly.

Wilhelm Ostwald's "Die Forderung des Tages" (Leipzig: Akademische Verlagsgesellschaft) is made up of a large number of addresses, lectures, and essays, on a great variety of subjects, held together by a thread of autobiographical narrative. Its delightful bits of reminiscences are a contribution to the psychology of the scholar of to-day, wide awake and interested in everything that goes on in the world of action and thought, whether it has anything to do with his own specialty or not. To be called a dilettante does not disturb him. Ostwald says, in the preface to another of his recent books, "Energetische Grundlagen der Kulturwissenschaft," that, in the interest of the cause, he has conquered the fear of entering another field as a dilettante, seeing that he on one occasion had been of assistance to the anthropologist Friedrich Ratzel, in offering him through the theory of energetics "ein bequemes und ausreichendes Denkmittel." And this theory, whose bearing on the humanities as well as on the natural sciences Ostwald himself rediscovered, is the *leitmotif* of his latest book. The title of the book the author took, as he tells in the introduction, from Goethe's "Maximen und Reflektionen": "Wie kann man sich selbst best kennen lernen? Durch Betrachten niemals, wohl aber durch Handeln. Versuche, deine Pflicht zu tun, und du weisst sogleich was an dir ist. Was aber ist deine Pflicht? Die Forderung des Tages." During his whole life as teacher, first as young *Dozent* in Dorpat, afterwards as professor, first in the Polytechnicum in Riga, then at the University of Leipzig, each day was always filled with its own demands. Now, though relieved from the daily duties of the university teacher, he still finds the day too short, so many are the causes which he has made his own. The first paper in the volume before us, "Zur modernen Energetik," serves as a guide to the thought that underlies the whole book. This theory, which he has expressed most concisely in the words: "die Energie ist unsere Welt," is related to pragmatism, and is, as Ostwald expressly states in the current number of the *Annalen der Naturphilosophie*, not a "general and sufficient principle for the understanding of the universe," but a method by which to explain phenomena. The contents of the volume fall into the following six groups, besides the introduction and the conclusion: Allgemeine Energetik, Methodik, Psychologie und Biographie, Allgemeine Kulturprobleme, Die Internationale Hilfssprache, Unterrichtswesen. The history of civilization is "the history of the subjection of energy by man," he says in the study of "Energetik und Kulturgeschichte." The aim of it all is "the delivery of humanity from suffering and the increase of its pleasure." But it is not a question of a superficial utilitarianism or hedonism. In "Der Fall Wangel" he tells of a well-known actress who left a successful career on the stage to join the Salvation Army, and who there, in the unselfish work for her fellowbeings, found the highest "increase of her pleasure." As a theory of human life and work, energetics might be called the theory of efficiency. Encourage everything that makes for efficiency, for the display of your fullest power, combat everything that produces a disproportionate amount of waste. What waste, for instance, it is that each people on the earth has its own language and that members of different nationalities who wish to communicate with one another must learn all these languages, which, besides, are made up according to no scientific or logical rules. Therefore, there is need of an auxiliary language. It should seem that here is, according to Ostwald, the greatest obstacle to the fullest efficiency; at least, he gave a substantial part of the Nobel prize to this cause.

Sir J. D. Rees, the author of "Modern India" (London: George Allen & Sons), has had a long and honorable career as an administrator in England's Eastern empire, having been at one time a member of the Council of the Governor-General of India; at present he has retired from active service and is a member of the British Parliament. His new volume is one of a series which aims to present a trustworthy description of British interests, resources, and life throughout the empire, and has been preceded by "Yesterday and To-day in Canada" by the Duke of Argyll, and "South Africa," by the Hon. J. X. Merriman. It is manifestly impossible within the scope of one small volume to discuss in even a mod-

erately exhaustive manner such fundamental questions as the ethnology, the caste system, and the religions of India; the foundation of British rule, the development of the Indian administrative machinery, the economic, political, and social results of British rule, and the manifold complexity of the present political situation. Nevertheless, the author has achieved his avowed purpose of touching upon most of the important issues and of adding something new to our knowledge of them. He effectively deals with such questions as the so-called economic "drain" of Indian resources by England, the participation of Indians in the government of the country, and the stock criticisms so often uttered by the professional critic of the British. In short, the book will give the thoughtful reader an intelligent and comprehensive outlook on the Indian situation.

"Das junge Deutschland und Goethe," by A. C. von Noé, was accepted by the faculty of the University of Chicago as a doctor's dissertation in 1905, but has only recently been published, the author having projected a larger treatise in which he hoped to incorporate it. After a brief survey of the literature already published on the subject, and a list of his own references, the author outlines the æsthetic programme of the movement known in literary history as Young Germany. He then takes up the writers of the movement and discusses their various relations to Goethe, backing up each statement made by quotations from the author concerned. Because of their outspoken partisanship, it goes without saying that their judgment of Goethe and his significance for Germany was not unanimous, and could not be expected to settle the question of what the Germans should make of their greatest poet. Menzel hated him violently all his life, ascribing to him talent, but no genius. Börne accused him of cowardice, servility, and weakness of character, but had words of praise for his lyric poetry. Heine's attitude toward him varied with his own state of health and personal or political affiliations, and may have been somewhat influenced by a feeling of jealousy; but as he grew in years he grew also in appreciation of Goethe. Wienbarg showed from the beginning a clearer grasp of Goethe's life and work, and was far more objective in his portrayal of the poet's relation to his age, even calling him the spiritual liberator of Germany. The other writers of the school represented combinations and variations of the tendencies of the three already mentioned. Goethe was such a dominating figure in the life and thought of his nation that if agitators could not use him for their purpose they felt they must seek to destroy his influence. Von Noé's study is interesting, not only in its results, but also in that the material collected illustrates the extreme opposite of the overzealous Goethe cult, of which so much has been said and written. It should seem as though Goethe had first to die and be vehemently maligned before he could become a permanent positive influence in the progress of his race.

The death, a year ago, of Prof. William Graham Sumner, and the tributes to his memory and work which came from a multitude of sources, brought to the public attention the fact, hardly recognized even by many of his warm friends and admirers, that the latter years of his life were devoted to studies more arduous, profound, and significant than those of his earlier manhood. The opinion had become somewhat general that when Professor Sumner swung over from the field of economics into sociology his creative work was mainly over. The error of this idea, however, was impressed upon all who read his last volume, entitled "Folkways," which appeared in 1907, and has just been reprinted (Ginn & Co.). This book was intended to be introductory to his treatise on the "Science of Society," upon which he had been working for eight years, but which he never completed. It contains in condensed form much of the richest and ripest of his individual thinking, and stands as a permanent contribution to the knowledge of social facts. As the sub-title indicates, it is "a study of the sociological importance of usages, manners, customs, mores, and morals." The greatest value of the book lies in the illumining discussion of the nature of the mores—a word which he used in its broadest sense—their method of growth, and their influence on human life and society. He strips society of all shams, and shows its true character with great clarity. The new printing contains only occasional slight changes in the text; it has, as frontispiece, a portrait of the author, and an introductory note by Prof. Albert G. Keller, the closest of his academic associates. Of special interest are the announcement by the Yale University Press of a memorial volume of collected essays, written by Professor Sumner, but not hitherto published in book form, and the tentative promise of the "Science of Society."

Chief Engineer Edward Biddle Latch, who died on Monday in his seventy-eighth year, and who had the rank of commander on the retired list of the navy, was the author of "A Review of the Holy Bible" and of a series of "Indications" dealing with the books of Job, Genesis, Exodus, Romans, Revelation, Leviticus, and Numbers.

The Rev. Thomas Samuel Hastings, D.D., former president of the Union Theological Seminary, died suddenly on Sunday, in his eighty-fourth year. He graduated from Hamilton College in 1848 and from the Union Theological Seminary in 1851. He received the D.D. from New York University, the LL.D. from Princeton, and from Hamilton College the L.H.D.

Science

Intracellular Pangenesis. By Hugo de Vries. Translated by C. Stuart Gager. Chicago: The Open Court Publishing Co. $3 net.

Near the end of the second volume of his treatise on "Animals and Plants under Domestication," Charles Darwin says that he was led, or rather forced, to form an hypothesis which connects the large classes of facts bearing on variation in organisms. He calls it "merely a provisional hypothesis or speculation; but until a better one be advanced, it will serve to bring together a multitude of facts which are at present left disconnected by any efficient cause. . . . Under this point of view, I venture to advance the hypothesis of Pangenesis, which implies that every separate part of the whole organization reproduces itself." In a foot-note, he candidly presents the most important objections which numerous critics raised against the hypothesis, and with unfeigned and characteristic modesty admits their force. In an early letter to Prof. Asa Gray, he wrote: "The chapter on what I call Pangenesis will be called a mad dream, . . . but, at the bottom of my own mind, I think it contains a great truth." In a letter, written a little later, to Sir Joseph Hooker, and quoted by the translator of the present work, he wrote: " I feel *sure* if Pangenesis is now stillborn, it will, thank God, at some future time reappear, begotten by some other father, and christened by some other name." Among the few who discerned the value of the hypothesis, was Hugo de Vries of Amsterdam. He saw that by a slight change in terminology and by an essential modification in one of the characters of the mechanism assumed by the hypothesis, a part of the serious objection could be removed. He suggested the substitution of the term *pangen* for the term *gemmule*, and he assumed that these material particles, which are the bearers of individual hereditary characters need not be transported, as Darwin suggested, throughout the whole organism, nor even from one cell of the organism to another, but may carry on their efficient work within the individual cell. Thus Darwin's hypothesis of pangenesis became De Vries's hypothesis of intracellular pangenesis. The revised hypothesis has now seen more than a score of years, without having received, before this, so far as we are aware, an adequate introduction to the English-reading public. The work in its original forms has been well known to scientific students, but even so, it has hardly received the attention which its merits deserved.

The whole question of heredity is engaging the energy of hundreds of investigators at the present time, and each one of these investigators is confronted by questions as to the mechanics of inheritance. Take, for instance, a Red Oak. In each of its forming seeds, there is a microscopic granule of living-matter which has been impregnated. This microscopic granule is endowed with powers of development which will, sooner or later, bring into full stature the oak tree. Moreover, it will bring out of the past and give to the mature oak, all the characteristic features of its immediate ancestors, and confer upon its flowers the power of transmitting these features to countless generations. Here then is the problem. What material entity within so small a compass can receive and transmit all the features of a race? The

physicist is obliged to postulate for his studies the existence of an ether, which cannot be demonstrated; the biologist endeavors to assume the existence of equally undemonstrable material particles. The ingenious manner in which the pangens are made to account for many of the activities of the organism will be of interest to a wide circle of readers whose pursuits lie outside the fields of biology. Every reader will find Professor Gager's translation remarkably free from involved sentences. The work is enriched by an admirable chapter on Fertilization and Hybridization, in which certain peculiar views of de Vries are well stated.

In a revision of his popular book, "Familiar Trees and Their Leaves" (D. Appleton), F. Schuyler Mathews tries a very interesting experiment on his readers. He is an accurate delineator of plants, whose services have long been in request by authors desirous of precise drawings. Now, in a revised edition of one of his own most popular works, he has reproduced his charming sketches in black and white, all of which are characterized by exactness, and then he has added good reproductions of a dozen impressionist water-color paintings. Of these last, he says, "My sketches in water-color were intentionally impressionistic. I avoided all those petty details which the camera could have given with minute fidelity, and aimed for color and effect, for mass and character." In these water-colors we have "lilac shadows, purple tree trunks, emerald foliage, cobalt sky, and the warm pink tone of the atmosphere" of an artist's day, of which the camera can make no record. He speaks of "the colored fire of cloud and sky, and the soft emerald of the meadow broken by the lilac-blue shadow" of the elm, and asks what camera can tell of these. In short, an artist, recognized as an accurate delineator in black and white, now presents these paintings which seem to him to be essentially truthful, and yet has purposely avoided all detail. Our readers will find a study of these sketches of much interest. The text has here and there received some emendation, always for the better.

Mrs. Ellen Henrietta Richards, for twenty-five years instructor of sanitary chemistry in the Massachusetts Institute of Technology, died last week at her home in Boston, aged sixty-eight. She graduated from Vassar College in 1870. Her writings include: "Chemistry of Cooking and Cleaning," "Food Materials and Their Adulterations," "The Cost of Living," "The Cost of Shelter," "The Art of Right Living," and "The Cost of Cleanness."

Dr. Simon M. Brainin of New York city died last Friday. He was born at Riga, Livonia, Russia, in 1854, and studied medicine in Dorpat and Berlin. He was appointed physician to the Jewish Community in Riga, and in the early nineties was its director. Dr. Brainin was a delegate to the Rabbinical conference in St. Petersburg in 1892, and a member of the Society for the Promotion of Culture Among the Jews of Russia. He came to this city in 1895. His books include "Sanitation and Hygiene" in Hebrew, and "Medical Guide" in Russian.

Drama

THE BOSS ON THE STAGE.

Paul Bourget's latest play, with politics for its subject, has failed in Paris. Its fate leads one earnest critic to ask why politicians on the stage are almost aways an artistic failure. With us the politician, in the British sense, is not so popular among dramatists as the boss. And with good reason. If the drama is to consist in a conflict of wills, what possible opportunity is there for Congressmen or members of the Legislature who notoriously have no will of their own? Power with us emanates from the boss, and in him, too, abides that picturesqueness of character which is indispensable to the playwright. Yet with all his initial advantages it must be confessed that the boss has scarcely been made a more effective figure on our stage than the parliamentarian or Cabinet Minister across the water. The type, as the playwrights have built it up, has become classic. The boss is a fat, unscrupulous person, with an inexhaustible fund of ready humor, and a fondness for roustabouts and little children. Like the inhabitants of a certain cannibal island discovered by the young English naval lieutenant and described in a brief cable to the Admiralty Office, his morals are none and his manners are beastly. In the end he does succumb to virtue as embodied in the honest young district attorney who is in love with his youngest daughter. But we are left with the impression that the defeat of the boss is a concession to the sentiment of the audience rather than to the inevitable march of events.

In Bourget's play the author is held not to have proved his thesis because the conflict he has depicted is not between the politician and the state, but between the politician who is a doting father and the state. In other words, he fights and loses not as a man of politics, but as any one might fight and lose, whether butcher or baker or Prime Minister, or boss. As a matter of fact, there are almost as many types of boss as there are bosses. In point of physique it is not essential that his chin should be double and his complexion unhealthy. Abe Ruef does not resemble Charles F. Murphy, and Matt Quay did not look like George B. Cox of Cincinnati. To show that their methods are frequently the same does not justify the creation of a type. Even their life history may be greatly alike in its progress from humble circumstances to the manipulation of millions of votes and dollars, and yet lay no basis for the development of a type. Grocers and dry-goods merchants make use of very much the same methods in their respective trades, but the type of the grocer or the merchant holds little dramatic promise. As a comic type the boss has his possibilities. George Ade has shown that in his "County Chairman." But precisely because the boss has become the daily food of the newspaper caricaturist and the newspaper paragrapher, he has become difficult of use on the stage. What the playwright has actually done is to give bodily presentment to the boss as the cartoonist has developed him.

On the mere ground of effective portrayal, the boss hardly lends himself to the purposes of the stage. The playwright sets out to depict a man of infinite resource and sagacity, like Kipling's mariner, and most often makes him act like a child. The mere notion of wire-pulling is hostile to the broad, coarse action of the stage. Plots nurtured during weeks of husky whisperings must be formulated on the stage in five minutes. Legislators who fight off temptation for years must succumb within the brief space of a single interview. It is precisely the same difficulty that confronts the playwright who attempts a great orator or a great musician or a great wit. In the very nature of things, the playwright's oratory, musicianship, or wit is bound to fall below the requirement; we are not living in Shakespeare's time. The mechanics of business life are too complicated for the stage. The captains of finance who have lately been inundating the stage in plays of the hour are a sorry lot, mentally. The ease with which they eliminate their enemies involves the suspicion of contributory negligence on the part of the latter. We may take the best of the plays of business life—Mirbeau's "Business is Business." The extraordinarily vivid figure of Lechat, the pirate-captain of industry, is depicted not in what he does but in what he says. We are shown a man who is a brute in his home, and we find it easy to imagine what he must be in his office. The only business scene in the play, the episode near the end where Lechat outwits the two rascally "promoters," is not very impressive. One of the two men is a fool and the other is a coward, and Lechat has only to yell at them for a minute or two in order to confound them. How infantile does this situation on the stage appear when compared with the record of one day's transactions in the history of the Carnegie Trust Company! Lechat the beast of prey is an impressive figure; Lechat the man of business is convincing only by reflected light.

But the fundamental fallacy lies in assuming that there can be a typical boss on the stage. For the approximate uses of every-day conversation we may speak of the typical boss or the typical business man or the typical artist. But when we speak of types on the stage we mean figures impressed with the stamp of universality. Tartuffe is a type, and Hamlet is a type, and Don Quixote and

Falstaff and Joe Sedley and Mrs. Jellyby are types, for the reason that in every one of us abides the capacity for hypocrisy, or ailment of the will, or ideal delusion, or the gross joys of life, or selfishness, or slovenliness. But it is quite evident that not all of us can be bosses or captains of industry or woman-suffrage leaders. A true type is made by the soul within. Occupations and professions are only accidents. There may be types of elevator boys and "salesladies" and commissioners of water, gas, and electricity; but such are sufficient only for the purposes of the comic artist and the vaudeville comedian, not for the stage.

Grace Isabel Colbron has made an English translation of Björnstjerne Björnson's two-act play, "A Lesson in Marriage" (Brandus). It narrates the troubles of a young husband, whose wife had been the spoiled child of doting parents, and who resented the proposal that she should leave the home in which she had so long been paramount. Her parents also regard his wish to have his wife to himself as a manifestation of heartless selfishness. But he stands upon his rights, and finally—with the assistance of a female ally, who awakens the wife's conscience by means of a parabolical story—procures his own and everybody else's happiness. The little play exhibits humor and observation, and makes pleasant reading, but is too artificial and didactic for stage representation. Moreover, it has no real dramatic interest, as the happy ending is never in doubt, and the emotional tempests are of tea-cup dimensions.

Mrs. Fiske is generally regarded as an exponent of the intellectual drama, but "Mrs. Bumpstead-Leigh," the "new comedy," by Harry James Smith, which she presented in the Lyceum Theatre on Monday evening, is a piece of no distinction either in manner or matter. The intent of it, which is to ridicule the democratic desire for aristocratic connections, and the absurdities of false family pride, is sound enough, but the illustrations are so crude and extravagant as to be inadmissible, except in farce or burlesque. The work of a novice's hand is betrayed by the long passages of narrative, the old stage types, the transparency of the devices, the arbitrary arrangement of convenient incident, and the utter conventionality of the means by which the desired ending is ultimately procured. If the piece had not offered a part generally suitable to the theatrical methods of Mrs. Fiske, and one that promised to keep her well in the limelight, it is not at all likely that it would have been produced in its present shape. The part is that of a social adventuress, a vulgar variant of the Becky Sharp type, who pushes her own way to the front and converts threatened defeat into victory by conduct which reduces her almost to the level of the common blackmailer. It is not pleasant in itself, and it is not notable for originality, veracity, or brilliancy of delineation, but it fits fairly well the theatrical personality of Mrs. Fiske, who plays it with her usual restless vivacity and abundant assurance. She was generously applauded—for she has a large body of faithful followers—but she is making no advancement as an actress, and her speech is becoming less and less articulate.

A performance of Marlowe's "Doctor Faustus" was given recently at Essen, Germany. For the occasion the text of 1604 had been translated by Morsbach and Repp; the staging was in the Elizabethan manner.

Sir Herbert Tree has decided to end the run of "Henry VIII" at His Majesty's Theatre, in London, on the 15th inst. He will then revive "A Midsummer Night's Dream," in which Arthur Bourchier will be the Bottom. New dresses and much new scenery have been prepared. The production of "Macbeth" has been once more postpoued, until the beginniug of next season.

It is probable that the new play which Walter Frith has written for Laurence Irviug will be produced in London before the end of the present year. Mr. Frith has also finished a new three-act piece, which has been procured by Lyn Harding. The leading part is that of a Welsh poet-farmer. Owing to the lack of a suitable London theatre, this play will have its earliest production in the provinces.

Herr Reinhardt has just given his spectacular production of the second part of "Faust" iu the Deutsches Theater, Berlin. A correspondent of a London journal says:

The numerous changes of scene—nearly twenty in number—succeeded each other with admirable precision, and the 8,000 lines of the text had been so shortened that it was hardly possible for the pageant to drag. The scenic effects, which included an elephaut and a centaur, were extraordinarily effective aud ingenious. . . . Considered as a pageant, and not as a tragedy, still less an allegory, Herr Reinhardt's production must be regarded as a brilliant success.

Edmond Rostand is at work on a translation of Goethe into Freneh; he begins with "Goetz" and "Tasso."

Paul Bourget's new play, "Le Tribun," which has just been produced in Paris, and which purported to exhibit the conflict between the principles of Socialism and the system of the family, seems to miss its mark entirely, and to be totally ineffective as a demonstration. Portal, Socialistic leader and prime minister, has discovered a system of parliamentary bribery in connection with admiralty contracts, which he expects to turn to great political account. He entrusts the evidence against the chief offenders to his son, whom he has made his confidential secretary. But the young man is desperately infatuated with a Madame Claudel, whose husband is on the verge of disgraceful bankruptcy. So he sells the evidence in his hands to the guilty persons for a huge sum of money, with which he relieves the distresses of his enchantress. When Portal learns the truth, he resolves to play the Roman father, and send his son to jail, but when the public prosecutor arrives he yields to the instinct of paternal tenderness and refuses to make any complaint. Then he resigns his office. It is clear that the issue here is in no way between Socialism and the family, but between paternal affection and official responsibility. Thus the play had little or none of the political significance which had been supposed to attach to it. But Guitry is said to have been uncommonly fine in the character of the broken statesman and wounded father.

Music

Some Commentaries on the Teaching of Pianoforte Technique. By Tobias Matthay. New York: Longmans, Green & Co. 50 cents.

Baltzell's Dictionary of Musicians. By W. J. Baltzell. Boston: Oliver Ditson Co. $1.25.

While the German-speaking peoples have given to the world most of the greatest music ever written, it is singular that as performers the Germans do not excel in the same way. Their great operatic conductors are mostly Hungarians, their singers, with a few exceptions, are not among the best, while of their pianists not one has equalled the Hungarian Liszt, the Russian Rubinstein, the Polish Chopin, Paderewski, and Hofmann. Yet Germany is now considered, as Italy used to be, a high-school of music for all the world. Professor Matthay of the Royal Academy of Music in London thinks, however, that the state of affairs when no British student felt safe unless he had finished his schooling abroad is now past history. He is glad of it, too, because we have to thank Germany, pianistically, "for much of the very worst teaching, to instance only the interminable exercise-grinding and monumental blunders of some of her 'Schools' and 'Methods'—methods which were accepted here and in America as undeniable gospel."

Eight years ago Professor Matthay gave to the world a book entitled "The Act of Touch," in which he tried to show that touch in pianoforte playing is no more a gift than is the art of articulate speech itself, and that it "can be acquired by every person of average intelligence"; upon which we commented that "if this be true, it is the most important news communicated to the musical world for many years." In that book, which remains the best treatise on the subject, the author glossed over many points in order that the main issues might not be obscured. These points he has now taken in hand in this Supplement to it, which is concerned with such topics as the principle of forearm rotation, arm-vibration, pianissimo playing, the use of bad touch forms, the artificial legato element, the purpose of arm-weight, the difference between key-striking and true pianoforte touch. On this last topic the author writes with much indignation, railing at the primitive and childish doctrine still taught in Germany that touch at the piano consists of tapping *at* the key-levers by finger-action or knuckle-action alone, although Czerny long ago recommended that the finger should reach the key "without any actual blow" and that the keys "must be pressed down." Two prominent German pedagogues, Steinhausen and Breithaupt, have recently issued treatises in which, on the whole,

the true method is taught; yet, in a chapter on British piano progress, Professor Matthay does not hesitate to say that "comparing the average English piano student with the average German student, we must pronounce England to have won the day—for the present."

The question whether professional teaching aids in producing great pianists is not considered by Professor Matthay. England has not yet produced one of higher rank than Fanny Davies and Katharine Goodson, unless Harold Bauer, whose mother was English and who was born in London, be credited to that country; in which case D'Albert may be called Scotch. Add to these the Irishman John Field, the originator of the nocturne, and we get a respectable array of names. All of these, with probably some minor ones of recent fame, may be found in W. J. Baltzell's latest volume, the "Dictionary of Musicians," which aims at being quite up-to-date, although some important names, among them those of the three great operatic conductors, Campanini, Hertz, and Toscanini, have been unaccountably omitted. English critics like Newman, Baughan, and Shaw might complain that they had as much claim to being mentioned as some of the American critics included in this volume. Had this book appeared a few weeks later, Mr. Baltzell would have been able to correct the statement that "Königskinder" has not been a success; it has proved both in America and Germany the biggest success of the season. The remarks anent Liszt's literary works are very misleading and unjust; some of them were marred by the collaboration of the Princess Wittgenstein, but the pages written by Liszt are easily recognizable and they compete with Schumann's literary writings for the claim of being awarded first prize among all books on music. Apart from these points the new biographic dictionary deserves much praise. Constantin von Sternberg contributes a page on the pronunciation of Russian names, and Tchaikovsky is spelled as in England, and not, as usually in this country, in the German way, Tschaikowsky.

A musical trilogy has, it is said, been written by Gustave Charpentier, author of "Louise," each part having two acts.

Max Reger, whom his admirers call "the Bach of the twentieth century," has been appointed general musical director of the Meiningen Theatre.

Another American girl has been acclaimed in Italy as a rising opera star. Her name is Meta Reddish; she has studied abroad for two years, and a few weeks ago she made her début in Naples as Amina in "La Sonnambula."

Berlin is better supplied with opera than any other city in the world. Besides the Königliche Opernhaus there are two other theatres which give operatic performances every day, and on Sundays usually two. The cosmopolitan taste of the Berliners is illustrated by the list of operas sung on the seven days from March 12 to 18. At the Royal institution the repertory included Mozart's "Magic Flute," Humperdinck's "Königskinder," Donizetti's "Daughter of the Regiment," Wagner's "Lohengrin," Beethoven's "Fidello," Leoncavallo's "Maïa." At the Komische Oper the works performed were: Verdi's "Traviata," Offenbach's "Hoffman's Tales," Puccini's "La Bohême," and "Tosca." Mozart's "Figaro," Verdi's "Il Trovatore," Johann Strauss's "Fledermaus," D'Albert's "Tiefland." The Volksoper gave: Meyerbeer's "L'Africaine," Flotow's "Martha," Verdi's "Il Trovatore," "The Dollar Princess," Nessler's "Trumpeter of Säkkingen," Verdi's "The Masked Ball," Weber's "Der Freischütz." In all, nineteen operas and one operetta.

The last volume of Glasenapp's monumental biography of Wagner is to be published in May by Breitkopf & Härtel.

Strauss's new opera, "The Rose Cavalier," has already been sung in German, Italian, and Czech. An English version is now in preparation. The manager of the Royal Opera in Berlin evidently does not want this work, for the Straussites have twice been taken in special trains to Dresden to hear it, and now it is said that the Magdeburg Opera Company is to be engaged to give it in Berlin at the Neue Schauspielhaus.

Henry Holt & Co. have arranged with Lieut. Arthur A. Clappe for a book on "The Wind-Band and its Instruments," which will be illustrated.

Sir Edward Elgar has accompanied the Sheffield Choir across the Atlantic to conduct performances of his "Dream of Gerontius," at Montreal, on March 2; Indianapolis, April 21; Chicago, April 24, and St. Paul, April 28, and of "The Kingdom" at Cincinnati, on April 18. In addition to Sir Edward's works the repertory will comprise "Messiah," "Elijah," Verdi's "Requiem," Berlioz's "Faust," Sullivan's "Golden Legend," Parry's "Best Pair of Sirens," Bach's "Pan," as well as glees, madrigals part-songs, and choruses by British composers. Australia and South Africa are also included in this tour.

Dodd, Mead & Co., who have procured the American rights of "The Autobiography of Richard Wagner," give out the following concerning the way in which the work has for so many years been kept secret:

Between the years 1868 and 1873 Wagner compiled his memoirs from diaries and other memoranda which he had kept for thirty-five years. As these memoirs were extremely frank, and discussed not only the affairs of the author, but the affairs and characteristics of prominent people of the time who were well known to the writer. Wagner took the utmost precautions to keep his work a secret. As it was impossible at that time to secure duplicate copies by a typewriter, the book was set up by French compositors who did not understand German. Twelve copies were printed, and the type was then distributed. Of these twelve copies eight were entrusted to Frau Cosima Wagner and four copies were distributed among the author's nearest and dearest friends. The greatest care was exercised in the event of the death of any one of these five people that the closely guarded memoirs should be turned over to one of the survivors. In this way the secret was kept so closely that, although Wagner died twenty-eight years ago, very few people, even in Germany, have known his autobiography was in existence.

Art

AT THE NATIONAL GALLERY.

London, March 25.

It is too soon to pronounce definitely upon the work now being done at the National Gallery. Chaos still prevails in the old rooms: walls overcrowded, screens standing where they are least expected and least wanted, doors walled up with building or re-building going on behind them. But five new rooms and a fine basement below have been opened, and their opening and the temporary exhibition of Lord Lansdowne's Mill have brought art once more upon the town, and Trafalgar Square and Pall Mall are lined with carriages, queues form as at the door of a popular theatre, a fresh newspaper correspondence is started, and Rembrandt's name is in everybody's mouth.

But the new rooms are something more than a seven days' wonder. They give a good idea of the manner in which the work of enlargement and rearrangement is being carried out, and of its value. Of the gain already in wall space, there can be no question. Pictures now enjoy a margin and are spread out along the line instead of being hung one above the other until the highest cannot be seen without a kink in the neck and weariness to the eyes. The improvement in this respect when all the new galleries are complete can hardly be over-estimated. Four of the rooms are of fairly good size; the fifth is very large, like the Venetian, Dutch, and Umbrian Rooms. Of the decorations I must speak with more reserve. London dirt and London atmosphere are so kind to the London decorator that he is apt to take advantage of the fact and rely upon them for his effects. A great deal has been left to time in these new rooms, which will probably be pleasanter and more restful a few months from now. The walls are covered with a heavy embossed paper, highly varnished, admirable from a spring-cleaning point of view, but with a disagreeable trick when fresh of catching the light, when old of catching the dirt, on the high ridges of the pattern. The flat tone used in the basement rooms makes a much more quiet and less obtrusive background. Nor do I think the choice of the color very happy. In two of the rooms, it is a vivid, rather sharp green; in two, a dull, lifeless red; in the large room, a gold that somehow is more broken up by the pattern than either the red or the green. The walls of the old rooms covered with the same paper show that the tone given to it by time has a tendency to dinginess. The frieze and the vaultings of the ceiling throughout the new building are of pure white, in its freshness so glaring that it cries out for a coating of London dirt; the glass at the top would be no less improved by a layer of

London smoke and smuts, for, extraordinary as it may seem to say such a thing of a gallery in London, the light at certain hours is far too brilliant, more especially in the large room. This is a fault, however, that a velarium or a system of blinds could easily remedy. The most has been made of the opportunity of rearranging as many of the pictures as the new rooms will hold. The work of the Ferrarese, Parmese and Bolognese schools as now grouped in one of them, can be far better seen than ever before. The French school, filling two, is treated with greater consideration than it has hitherto received, though the gaps in it are still deplorable. Claude is shown with a trifle more dignity at last. Fantin's portrait of Mr. and Mrs. Edwin Edwards hangs on the walls, while opposite a place has been made for Corots and a Millet from the Salting collection. A fourth room is devoted to the sixteen Turners reserved for the National Gallery when the others were removed to the Tate, and here the two Claudes hang again by the two Turners, as the English painter was mistaken enough to stipulate in his will that they should. As the other Claudes are in the adjoining room, the student may further pursue and elaborate the suggested comparison. The large gallery contains a fine selection of British pictures from Dobson and Hogarth to Constable and Crome. The sense of space here is delightful, all the more so when one remembers the overladen, jumbled-up walls of the British Section as it used to be not so very long ago. No one painter is represented, even as exhaustively as he might be in Trafalgar Square, but a representative series of each has been made, and Hogarth's Shrimp Girl—not, however, enjoying the place of distinction it deserves—Reynolds's Three Graces and portrait of Two Gentlemen, Gainsborough's Mrs. Siddons, Constable's Hay Wain, Crome's Mousehold Heath, with other paintings as characteristic, now hang together. In the endeavor to show the British pictures at their best, as was never possible under the old conditions, zeal appears to have been carried too far. Surely, it is not only the result of the new and more spacious hanging, or of the hard light that has been streaming down upon them during these last bright March days of east wind, that many look so painfully fresh and clean. I do not know exactly what has been done to them, if anything; I cannot say whether or no they have, while waiting to be re-hung, passed through the restorer's or the cleaner's hands; but certainly they have an air of having been recently and thoroughly done up, though the worst shock is when one comes to Gainsborough's Market Cart, and sees the wide space of blue sky to the left of the picture shining with cleanliness as if it had been painted but yesterday, and then not by a master of color.

In the basement the hanging is provisional, so that it calls for no criticism. This is fortunate, for the walls and screens present a bewildering assortment of all schools and all periods. When more new rooms are built, or more old rooms remodelled, the disorder will right itself. It is to be hoped that then as few pictures as possible will be left downstairs. The rooms are large and spacious, but, of course, there can be no top light, and in the cross lights the paintings can with difficulty be seen; and, worse, screens upon which they are placed make a series of those little alcoves that are so irritating in many Continental galleries and that the National Gallery has hitherto been able to do without. But it will be time to criticise when the additions and alterations to the building are entirely finished.

The Mill is attracting more people to the National Gallery than even the new rooms. Lent by Lord Lansdowne for an interval before its sale, it is placed temporarily in the small room where Francia and the others of his school used to hang. The object is that the public, seeing it once more, will realize the urgent need of raising one hundred thousand pounds, to which Lord Lansdowne will generously contribute his little mite of five thousand, and so save it for the nation before it has fallen into the rapacious grasp of the inconsiderate American who has offered to buy it at the price. To expect a government, obliged to meet the bill for old age pensions and new Dreadnoughts and increased Ministerial salaries and no end of other necessities, to pay the required sum for such a luxury as another Rembrandt is out of the question. There is not much hope from the National Art Collections Fund, which, in the last emergency of the kind, only scraped through with the help of the anonymous donor who contributed forty of the seventy thousand the Duke of Norfolk demanded for his Holbein—the millionaire is rare who will give away a small fortune for any but the pictures that go into his own collection. And from the general public, as a last resource, there is no hope at all. They may crowd to gape at the painting, but that is not because of any appreciation of its beauty or admiration for Rembrandt, but simply because of the money it represents: a hundred thousand pounds' picture is not to be seen every day. And, moreover, the public are having enough nonsense talked to them to make them hesitate to put their hands in their pockets, even if they felt so inclined. They are told that Rembrandt has already delivered his message to England—though just what this means I doubt if anybody could explain—and that therefore The Mill is not essential to the happiness of the country. They are assured that it is valuable mainly as an expression of Protestantism—though heaven knows how or why—and that as this expression is found also in the landscapes of Crome and Constable, therefore the Briton may cheerfully let the Rembrandt go to convert the poor heathen American who still believes that Benjamin West and Copley are masters. Some suggest that the hundred thousand pounds would be better spent upon painters whose message has not yet been delivered to England, the "Post-Impressionists" by choice; or else on the young English geniuses who curiously happen to be the friends of those who think they should be encouraged. Royal Academicians are horrified at the waste, when they remember that the income of a hundred thousand pounds could purchase the four best pictures of the year until the end of time; enterprising editors send round circulars to people with names to ask if they think The Mill "a bargain" at the price. On the other hand, there are appeals to public patriotism—is England to see her treasures depart for other lands without a protest? There are appeals to public sentiment—think of the inestimable privilege of gazing upon the picture of the mill where Rembrandt was born and received his earliest impressions, even though the authorities say he was not born there at all. In fact, the old floodgates of Victorian sentiment have been opened.*

It is clear that the excitement within a few years over the Rokeby Venus and the Duke of Norfolk's Holbein, and now, over Lord Lansdowne's Rembrandt, has made England feel the necessity of taking some such measures as Italy has already taken, if the great masterpieces in private collections are not to be lost to the nation. Only the other day, the question came up again in the House of Commons, and indeed it may be the anticipation of the government's interference that has caused some of the owners of these masterpieces—heavily burdened as they are with death duties and new land taxes and unearned increment taxes and super-income taxes—to part with them and make an honest hundred thousand or so when they can.

N. N.

Atkinson, Mentzer & Grover announce the transfer of the publications of the Davis Press of Worcester, Mass., to their list, with the exception of the "School Art Book," which has been sold to the National Arts Publishing Company of Boston.

The new volume in the "Ars Una: Species Mille," general history of art series, "The History of Art in France," by Louis Hourticq, which is promised for May by the Scribners, is said to be modelled on Reinach's "Apollo."

---

*A dispatch dated April 3 states officially that The Mill has been sold, probably to an American.

The *Bulletin* of the Brooklyn Institute in recent weekly numbers has printed a series of articles by Prof. William H. Goodyear on the Baptistery, Leaning Tower, and Cathedral of Pisa. On the basis of his own surveys, the photographic records of which are part of the collection of the museum of the Institute, Professor Goodyear discusses leaning constructions (the Baptistery falls under this class), curves in plan and in elevation, and various calculated irregularities in building. The arguments and verbal descriptions are supported by plates of excellent clearness and adequate scale. Most of the photographs have been recently taken by a new and expeditious method of sighting across a plumb line suspended in the camera itself. Students of architecture, and for that matter working architects, will find these numbers of the *Bulletin* useful and instructive.

Important excavations have been carried on by Mr. J. Hatzidakis, ephor of antiquities in Crete, near the village of Tylisos, about six miles west of Candia and Knossos. They have resulted in the discovery of a palace with surrounding buildings which belong to the same period as the other Minoan palaces in Crete. It also was destroyed by violence and fire, and many of the movable articles seem to have been carried away; but enough remains to show the high state of civilization in which the occupants lived. Already an area of about 600 metres—that is about half the palace—has been unearthed. About six metres west of the palace was discovered a building, 25 by 15 metres in extent, divided into five apartments. The palace was two or three stories in height, as can be seen from the remains of staircases. It belongs to the late Minoan period, but traces of the Middle Minoan period have been found in a lower stratum. The objects unearthed are similar in character to those found at the palaces of Knossos and Phæstos. Most important among them are: huge bronze cauldrons and other vessels; a small bronze statuette, about twelve inches high, of beautiful execution; many fragments of pottery; several steatite vases; two large pedestals for lamps; and a fine *rhyton* of obsidian. There were also found two tablets with Cretan script, and fragments of wall-painting. A few yards' distance from the palace was discovered a pit filled with sherds of the Early and Middle Minoan periods, from which circumstance it is hoped that objects belonging to these earlier periods will also be discovered. To the north of Tylisos, near the river Gazes, a cemetery of the Middle Minoan period was discovered, and near the shore a settlement of the Minoan period. These will be explored later.

To the "General History of Art" (Scribner), which is issued in five languages simultaneously, has been added Corrado Ricci's "Art in Northern Italy." The record in painting, sculpture, and architecture, has been carried down to recent times, and an extraordinary amount of information has been packed within the covers of this pocket volume with its hundreds of small illustrations. Naturally condensation is the rule. Such artists as Titian and Correggio have to be dispatched with half a dozen pages each. Yet Commendatore Ricci contrives to make his text always vivacious and readable, and the little book is a model of its kind. We note only the minor inconsistency that Vittore Pisanello appears on page 40 under his traditional name, while on page 112 he receives his new style of Antonio. Giorgio Schiavone on page 101 is a palpable misprint for Gregorio. In the last paragraph of page 53, first line, the translator should have inserted the word *former* to make the reference clear. In general the book deserves unstinted praise. It is an eloquent argument for the expert as the best popularizer.

Sir Richard Rivington Holmes, whose death in his seventy-sixth year is reported from London, was librarian at Windsor Castle from 1870 to 1906, wrote the lives of Queen Victoria and King Edward, was archæologist to the British Abyssinian expedition in 1868, and achieved some distinction as a designer and a painter in water colors. Other books by him include: "Naval and Military Trophies," "Specimens of Royal, Fine, and Historical Bookbinding," and an edition of the "Book of Common Prayer," with titles and borders designed and drawn by himself.

Sir Caspar Purdon Clarke, formerly director of the Metropolitan Museum of Art in New York, died last week at his home in London, aged sixty-five. He was educated at Gaultier's Collegiate School, Sydenham, at Beaucourt's School in Bologne, and at the National Art Training School in South Kensington. At the age of thirty-two he was appointed architect of the Indian section of the Paris Exposition in 1878, and immediately afterwards he was commissioned by the South Kensington Museum to collect objects of art in Germany, Italy, and Spain; in 1892 he was made keeper in this museum of all the art collections, and in 1896 became its director. The English government made him its royal commissioner to the Paris Exposition of 1900 and to the St. Louis Exposition of 1904. In the following year the Metropolitan Museum engaged his services, and he quickly instituted his policy to make the museum attractive to the common people. Some estimate of his services to the museum was given in the *Nation* of July 7, last year, just after his retirement, on account of failing health. He was a fellow of the Royal Society of Antiquaries, of the Royal Society of British Architects, a member of the Royal Asiatic Society, of the Royal Academy of Madrid, and was honored by the order of the Crown of Prussia.

Finance

SOME ILLUSIONS OF CORPORATION FINANCE.

Ten years ago this month, when a very remarkable economic situation, such as does not twice occur in a generation, had swept off their feet some of the most experienced financiers, it became the word of the day that forces were at work which had never been at work before, and that, therefore, practical financiers might do things which all their previous experience had pronounced impossible or improper. This notion had its field of activity, as such notions usually do, in corporation finance. It took shape especially in four startling theories, all proclaimed and applied by eminent financial leaders of the day. First, the general welfare would be promoted if competing corporations were to buy one another's stock, exchange directors with one another, and arrange their affairs harmoniously. Second, the investor's best interests would be subserved if a company's capital stock should be made so large that nobody could control it, and hence that existing managements could never be unseated. Third, a huge combination of companies did not need to husband its working capital, because, when it needed money, it could borrow from the banks. Fourth, stock was entitled to dividends and ought to get them, no matter what the origin of the stock or the trade conditions of the moment.

In the ten succeeding years, these extraordinary theories, one by one, have been exploded. The first was shattered when it was found that "community-of-interest" directors were not allowed either to direct or to learn the secrets of a company. The real possibilities of capitalization so large as to guarantee immunity of a management from discipline were exposed to public view when the stupid trade policy of the Amalgamated Copper was discovered, and when the most powerful financial interest in the country had to take a hand in stopping the Steel Trust management from an act of incredible folly. The problem of working capital had some new light thrown upon it in 1903, when the Lake Superior Company went down, the Cotton Duck and New England Yarn corporations assessed their unlucky shareholders and the Steel Trust had to stop dividends, in each case because of the lack of a proper operating surplus.

The theory, finally, that a stock, however created, was entitled to dividends, had some awkward blows, but it has persisted longer than the others. Not only did it raise its head in the Steel Corporation's attempt of 1903 to buy up its own preferred shares with borrowed money, so as to leave the inflated common shares in the field of dividends, but it reappeared, not six months ago, in the argument at the Interstate Commission hearing, to the effect that transportation rates should be put up high enough to guarantee dividends on stock of every railway, whatever its capitalization, situation, or policy. It has once more cut a figure, along with a dash of pretty nearly all the other exploded illusions above referred to, in a somewhat sensational controversy of the past week.

The American Woollen Company, organized among the $3,593,000,000 industrial incorporations of the year 1899, had outstanding lately $40,000,000 preferred stock and $29,500,000 common. The preferred, being "cumulative," had to pay 7 per cent. dividends; the com-

mon has never paid anything. In 1908, the preferred stock's dividend was not fully earned; in 1910, the surplus earned, after greatly reducing depreciation charges, was only 2¼ per cent. on the common stock. During 1909, $5,000,000 was raised by sale of new preferred—"for the purpose," the president explained, "of meeting extraordinary requirements in the purchase of wool, and in the manufacture of goods already sold and still in demand."

Barely a year and a half after this recourse to the market, the management has now sent out to shareholders this announcement:

> After nearly twelve years of patient waiting, it would seem that the time had come when some consideration was due to the common shareholders of your company. . . . Your directors have felt that they could not justifiably enter on a dividend-paying course on the common shares until they were wholly confident of being able to continue that dividend with the same regularity and reliability that now attach to the preferred shares.
>
> It seemed, therefore, in the interest of the preferred shareholders, that your directors should avail themselves of the privilege allowed by the laws of the State of New Jersey to buy in the open market the shares of the common stock, and this your directors have done, until they have purchased 95,011 shares.

Nothing is said as to whence the $3,000,000 or so required to buy these 95,000 common shares was obtained. In default of such explanation, it has been imagined that, directly or indirectly, the $5,000,000 cash raised by sale of new preferred stock has served the purpose. If this were so, it would present the novel situation of a company borrowing at 7 per cent. to buy up stock paying nothing and not required to pay anything.

This may not have been the fact; but if not, the only alternative is that $3,000,000 of a company's cash assets have been employed to purchase something for which the company had no use whatever. This being so, it will be interesting to see what sort of family discussion is evoked when the special meeting, called to vote upon this remarkable fiscal undertaking, convenes on April 28. It is hardly necessary to explain what a Pandora's box of mischievous financiering would be opened, through the adoption of the theory that directors of a company were entitled, at their will, to use the cash resources of the company, or the proceeds of its obligations, to buy up its stock for cash. That is a vastly different thing from reducing share capital by the voluntary action of the shareholder and with no expenditure of cash. The absurdity of this new expedient, it would seem, is only paralleled by the hazards invoked through giving any "inside management" such a chance for secret ventures on the market.

Considered in this light, the Woollen Company affair is a genuinely important incident of the day. It is financial experiments of the sort, their reception by the community as a whole, and their results in corporation policy, which give their particular color to an economic period. Sometimes a relatively unimportant incident, like the shareholders' meeting of the Metropolitan Street Railway, compelled in 1902 to approve the lease of that company to a four-mile Westchester trolley line, is so evident a landmark of the day as to become historic.

QUICKSANDS

A NOVEL

By Fannie Heaslip Lea

12*mo. Illustrated.* $1.20 *net.*

Brilliant dialogue, a subtle sense of the comic and the tragic, a graphic touch in the portrayal of an attractive group of people and their environment, and, in general, a fine artistry, characterize this novel, which presents a recurring problem—a wife out of love with her husband and deep in love with another. How she contrives to save something of honor and happiness from shipwreck is the theme of this engrossing story.

STURGIS & WALTON CO.

A book that marks a turning point in American political history.

The Baker & Taylor Co., New York

STORY TELLING AS AN ART

The influence of the story in the home, in the school, on the playground, in the social circle, is great. By means of the story of the right kind, told in the right way, seeds are sown that grow into right thinking and right living—that make for good citizenship and lead toward perfection in the individual, and through him, in the state.

Richard T. Wyche, President of the National Story Tellers' League of America,

IN

Some Great Stories and How to Tell Them

tells of the development of story telling as an art, tells what manner of story to tell, tells how to tell it and then tells some stories himself—his versions of famous old stories.

Well printed. Cloth bound. 188 pages. Price, $1.00.

At your local book store or direct from the publishers.

NEWSON & COMPANY NEW YORK BOSTON CHICAGO

APPLETON'S NEWEST BOOKS

Ready April 7 **David Graham Phillips's** New Novel

THE GRAIN OF DUST

A powerful story emphasizing the effect of contrasting personalities upon each other; showing how a tremendously forceful, domineering, arrogant, self-confident corporation lawyer completely loses his grip, drops to the brink of ruin, and rises again, through his love for a timid, self-effacing girl who is a stenographer in his office.

Illustrations by A. B. Wenzell. Cloth, $1.30 net.

The Obvious Orient
By Albert Bushnell Hart

Dr. Hart's eight months' visit to Japan, China and the Philippines resulted in this interesting new volume, which, notwithstanding its title, records considerably more than surface impressions.

Cloth, $1.50 net.

Egypt: Ancient Sites and Modern Scenes
By G. Maspero

"A fascinating volume. It has remained for a few men like Professor Maspero to show that an understanding of the ancient Egypt is impossible without an appreciation of the Egypt of to-day."—*Boston Transcript.*

Illustrated. Cloth, $4.00 special net.

Property Insurance
By Solomon S. Huebner

A valuable treatise on fire insurance, marine insurance, corporate surety bonding, title insurance, and credit insurance, with copies of the leading forms and clauses.

Illustrated. Cloth, $2.00 net.

The American Year Book
A Record of Events and Progress

"The eagerly awaited 'American Year Book for 1910' bears out the promises of its projectors. It is evident that this work must take a prominent place beside such invaluable publications as 'The Statesman's Year Book,' 'Hazell's Annual,' etc. Every field of general interest has been thoroughly and carefully covered."—*The Nation.*

887 Pages. Completely Indexed.
Small 8vo, Red Cloth, $3.50 net.

Diaz: Master of Mexico
By James Creelman

"Mr. Creelman's book deserves to be widely read, not only for its romantic and historic interest, but for its spirit of appreciation, its freedom from jingoism."—*Chicago Record-Herald.*

Illustrated. Cloth, $2.00 net.

Extinct Monsters and Creatures of Other Days
By Rev. H. N. Hutchinson

Originally published as two books this material now has been revised and combined into one volume, covering nearly all the monsters of early days of which anything is known.

New Edition. Illustrated. Cloth, $3.00 special net.

Railroad Traffic and Rates
By Emory R. Johnson and Grover G. Huebner

"It is a relief to find a really constructive study of the question, after the flood of muck-raking contributions which have been poured over the country."—*Charleston News and Courier.*

Two volumes. Illustrated. Cloth, $5.00 net.

The Prevention of Infectious Diseases
By Alvah H. Doty, M.D.
Health Officer of the Port of New York

An important volume giving the latest knowledge relative to the transmission of infectious diseases and the means by which they may be prevented.

Cloth, $2.50 net.

VOL. XCII.—NO. 2389 THURSDAY, APRIL 13, 1911 Reg. U. S. Pat. Office. PRICE TEN CENTS

FROM DUTTON'S SPRING LIST

UNSOUNDNESS OF MIND

By T. S. CLOUSTON, M.D., LL.D., F.R.S.E.

Author of "Hygiene of the Mind."
Formerly Lecturer on Mental Diseases in the University of Edinburgh; Physician-Superintendent of The Royal Edinburgh Mental Hospital; and President of The Royal College of Physicians, Edinburgh.

Illustrated. $2.50 *net.*

This treatise is an attempt to bring before the intelligent layman, in language as free as possible from technicalities, the latest scientific discoveries and views in regard to those mental diseases, perversions, and defects which affect mankind and influence human conduct. There are few things in which the intelligent public are more interested than this, but about which they know less in a definite way. What UNSOUNDNESS OF MIND is, in the scientific sense, and what it is not, and what are the indications for its recognition, treatment and prevention are the objects of this treatise.

THE HOUSE OF HOHENZOLLERN

By E. A. BRAYLEY HODGETTS

Author of "The Court of Russia in the Nineteenth Century," etc.

Illustrated. $5.00 *net.*

Commencing with the life and character of Frederick I., who was such a problem to Carlyle, Mr. Hodgetts has covered the whole period from that monarch to the present Emperor, a character sketch of whom closes the book. He has assumed that the reader is acquainted with the history of Prussia in its main features, and has confined himself to interesting descriptions of the leading actors on the historical stage, accompanied here and there by extracts from their correspondence, anecdotes, etc., the whole making a most entertaining and instructive work.

APPRECIATIONS AND CRITICISMS OF THE WORKS OF CHARLES DICKENS

By G. K. CHESTERTON

Illustrated, $2.00 *net.*

Mr. Chesterton keeps in view the relation of Dickens, not only to his own time and his own people, but to the vast and menacing movements which have emerged since the Victorian compromise. The many portraits of Dickens (some of them rare) provide an added attraction for any Dickens-lover.

"Each sentence is packed with keen observation, pungent criticism, trenchant thought formulated in brilliant language."—*Philadelphia Public Ledger.*

THE NEW ARNOLD BENNETT BOOK

DENRY THE AUDACIOUS

By ARNOLD BENNETT

Author of "Clayhanger." $1.35 *net.*

"As delightful a human comedy as has ever been written."—*Boston Transcript.*

"Written with very great facility and sparkles with cleverness from start to finish."—*New York Times.*

"Thoroughly entertaining and novel."—*New York Herald.*

BLAKE

By G. K. CHESTERTON

A profound and entertaining study of the genius of William Blake, which not only interprets Blake, but gives us Chesterton in his happiest mood. *Fully illustrated.*

Leather, $1.00 *net; Cloth,* 75 *cents net.*

TWO IMPOSTORS and TINKER

By DOROTHEA CONYERS $1.25 *net.*

A charming story full of Irish wit and humor.

THE BRASSBOUNDER

By DAVID W. BONE $1.25 *net.*

A strong, live sea story full of interesting adventures.

Illustrated by the Author.

A SPIRIT OF MIRTH

By PEGGY WEBLING $1.25 *net.*

The story of a pretty, talented, optimistic girl surrounded by a circle of real "characters." A quick, bright story well worth reading.

MOFFAT, YARD & COMPANY **GOOD BOOKS NOW READY EVERYWHERE** MOFFAT, YARD & COMPANY

GRAY DAYS AND GOLD

By WILLIAM WINTER

Uniform with *Shakespeare's England*. Illustrated. $3.00 net.

"To the lover of all that is best associated in art and literature with names, places and events imperishable in English history, this volume must possess a worth that cannot be overestimated."—*Richmond Times-Dispatch.*

"He picks up in many spots the trail of romance and poetry. He studies life through genius. The book is, in short, one which will greatly increase the body of William Winter's admirers."—*Hartford Post.*

"The whole book is charged with full and accurate scholarship, especially on subjects connected with the life, the creations and the times of Shakespeare, but is exempt from all taint of pedantry. It is a felicitous blend of pleasant and informing gossip, brilliant description, delicate and poetic perception and grave reverie. . . . The intelligent reader who opens it will not lay it aside until he has absorbed all that lies between the covers, and he will be grateful to the man that produced it."—*The Evening Post.*

THE WORLD OF LIFE

A Manifestation of Creative Power, Directive Mind, and Ultimate Purpose

By ALFRED RUSSEL WALLACE, O.M., F.R.S., D.L.C., etc.

Illustrated. $3.50 net. By mail, $3.70.

"The work is remarkable in many ways. It is the product of a remarkable personality; Dr. Wallace is eighty-eight years of age, and has had a unique history as a scientist. It is remarkable for its original thought and thought-provoking theories. It is remarkable that a man whose life has been given up to so great an extent to the study of physical science should so firmly believe that spirit is the only real cause, and that this is the best of all worlds and that it is "the only inhabited planet, not only in the solar system but in the whole stellar universe." It is sure to be one of the great books of the twentieth century."—*Boston Transcript.*

The Interpretation of History

By MAX NORDAU

$2.00 net. By mail, $2.18

This closely reasoned book will make a strong appeal to all students of history and philosophy.

The History of Parliamentary Taxation in England

By SHEPARD ASHMAN MORGAN

$2.00 net. By mail, $2.20

"An uncommonly clear and well-written account."—*New York Sun.*

The Solution of the Child Labor Problem

By SCOTT NEARING, Ph.D.
University of Pennsylvania

$1.00 net. By mail, $1.10

"The sanest, clearest, strongest volume."—*Reginald Wright Kauffman.*

NOVELS

BARBARA *of* THE SNOWS

By HARRY IRVING GREENE

Color frontispiece and Other Drawings by Harvey Dunn.
12mo. $1.35 net. By mail, $1.47

This is a fine outdoor novel, full to the brim of youth, spirit, struggle, and unconquerable purpose. The story is swift in its action, whirling the reader from climax to climax of a moral drama of real power.

BASSET: A VILLAGE CHRONICLE

By S. G. TALLENTYRE

12mo. $1.25 net. By mail, $1.37

"A tale which is sound as a ripe apple and real as the quaint old daguerreotypes in the attic trunk, and which manifests natural, convincing admixture of pathos and humor, tragedy and commonplace happenings, 'pure human' nature and the higher thoughts and emotions that sometimes transform it. Only, if you happen to like good and modest literature—read 'Basset,' that's all!"—*Chicago Record-Herald.*

Memorial Day
(Our American Holidays)

Edited by
ROBERT HAVEN SCHAUFFLER

$1.00 net. By mail, $1.10

One of the very best volumes in a series of anthologies which is becoming widely recognized and used.

Queenie; the Autobiography of an Italian Queen Bee

By T. CHALMERS POTTER

Ill. 75 cents net. By mail, 83 cents.

"A fascinating story of the popular school of nature fiction."—*New York Herald.*

Learning, and Other Essays

By JOHN JAY CHAPMAN

$1.25 net. By mail, $1.35

In which the author preaches the need of a return to classical standards of education.

APRIL **Spring Books** 1911

Marie Claire By MARGUERITE AUDOUX *12mo. Net, $1.20*
A modern Classic.—*Life.*
Possesses emphatic claim to originality and distinction.—*The Evening Transcript, Boston.*

The Human Machine By ARNOLD BENNETT *12mo. Net, $0.75*
A remarkable freshly written book. The author keeps us in his grip for the whole 123 pages he has decreed we shall read.—*The British Weekly.*

The Road to Avalon By CONINGSBY DAWSON *12mo. Net, $1.20*
A novel of happiness and joy based on the old French legend that King Arthur is living. It is original, strong and has a deliciously magical charm that strikes quite a new note in fiction.

Leila By ANTONIO FOGAZZARO (*Ready April 15th*) *12mo. Net, $1.35*
(A companion to THE SAINT) This, the last novel by the greatest of modern Italian novelists, is a sequel to THE SAINT. It is the story of a woman's heart, while THE SAINT was a story of a man's conscience.

The Round of the Clock By SIR W. ROBERTSON NICOLL *12mo. Net, $1.25*
The book of the story of a man's life as shown by the twelve periods of five years each represented by the face of the clock. A storehouse of philosophy and pleasure. An encyclopedia of accomplishment. A source of inspiration.

The Lighter Side of My Official Life By SIR ROBERT ANDERSON *Octavo. Net, $3.50*
The inner story of Scotland Yard,—as fascinating as The Adventures of Sherlock Holmes.

The Old Wives' Tale By ARNOLD BENNETT *12mo. Net, $1.50*
A new edition with the narrative preface of the book which the Review of Reviews declares is Arnold Bennett's best book.

The Common Sense Collector By FRANK FRANKFORT MOORE *Octavo. Net, $3.00*
A handbook of hints on the collecting and housing of antique furniture.

How to Live on 24 Hours a Day By ARNOLD BENNETT *12mo. Net, $0.50*
The book that everyone is reading.

FICTION

What's-His-Name

By GEORGE BARR McCUTCHEON

"What's-His-Name" is the story of a man who is overshadowed by circumstances, overshadowed by his wife, overshadowed by New York—a man who thinks he is "no good," and yet it is the story of a man who distinctly and emphatically "makes good." A great many, many readers are going to feel, as they turn the last page, that here is a truly wholesome and charming story, a story that does one good to read.

Illustrated in color by Harrison Fisher.
12mo, $1.20 net. Postpaid, $1.32.

Cynthia-of-the-Minute

By LOUIS JOSEPH VANCE

On a certain sultry morning, say as lately as last summer, there were residing in New York, among four and a half million other people, four individuals, who were strangers to each other, and within two days they were together on an outward-bound steamship. And what a voyage that was! What a drama of adventure and sudden death, of secret treachery and unexpected heroism, of love-making and villainy, right to the deplorable words, "The End!"

Illustrations by A. I. Keller. 12mo, $1.25 net.
Postpaid, $1.37.

The Catspaw

By WILLIAM HAMILTON OSBORNE

An intricate, ingenious, baffling, and surprising detective story by the author of "The Red Mouse."

Illustrated. 12mo, $1.25 net.
Postpaid, $1.37.

The Unknown God

By B. L. PUTNAM WEALE

Wonderful for the way in which it takes the reader to a strange land and sets him squarely down in the midst of China.

Postpaid, $1.32.

Hearts and the Highway

By CYRUS TOWNSEND BRADY

A story of gay gallants and a damsel fair, told with all the author's characteristic vigor and dash.

Illustrated, 12mo, $1.25 net.
Postpaid, $1.37.

Five Gallons of Gasoline

By MORRIS B. WELLS

A book to have at hand when the chauffeur, or some one else, is lying on the road under one's own machine, engaged in tinkering; or when one's machine is temporarily at the repair shop, at so many dollars per day. This story will take the edge off such misfortunes. *Illustrated. 12mo, $1.20 net. Postpaid, $1.32*

ESSAYS

Alarms and Discursions

By GILBERT K. CHESTERTON

"A volume of essays, bright, entertaining, epigrammatic, paradoxical, good sense disguised as nonsense; a book to make you laugh, a book to make you think, a court jester talking wisdom; in brief, G. K. Chesterton."—*The Outlook.*

12mo, $1.50 net. Postpaid, $1.63.

The Patchwork Papers

By E. TEMPLE THURSTON

There could be no more characteristically fresh, simple, and delightful book from the author of "The City of Beautiful Nonsense." Not formal enough for essays, nor sufficiently constructed to be called short stories, they are just pictures of life.

12mo, $1.20 net. Postpaid, $1.32.

The Patient Observer

By SIMEON STRUNSKY

"Every time I pick it up I find something a little better than what I read before," writes a well-known bookseller.

LONGMANS, GREEN, & CO.'S NEW BOOKS

A History of Wales from the Earliest Times to the Edwardian Conquest

By JOHN EDWARD LLOYD, M.A., Professor of History in the University College of North Wales, Bangor. 2 vols. 8vo. pp. 380+468. $6.00 net.

In this work the story of Wales is told in detail down to the struggle in which the country lost its independence. Prehistoric Wales, Roman Wales, the early institutions of the Welsh, the political divisions of the country, the Norman invasions and settlements, and the achievements of the more powerful princes are successively described. Special sections are devoted to the history of the Welsh Church. The relations between England and Wales are traced at each stage, and the reaction of Welsh upon English history is illustrated.

The History of Trade Unionism

By SIDNEY and BEATRICE WEBB. With Map and full Bibliography of the Subject. New Edition, Tenth Thousand. 8vo. $2.60 net.

This Edition has a new introductory chapter dealing at considerable length with the situation created by the Osborne Judgment, the principal industrial conflicts of recent years, and with the development of Trade Union constitution and function during the past two decades.

On the Theory of the Infinite in Modern Thought: Two Introductory Studies

By E. F. JOURDAIN, Doctor of the University of Paris, Vice-Principal, St. Hugh's Hall, Oxford. Crown 8vo. $0.75 net.

John Merridew

By FREDERICK ARTHUR. Crown 8vo. $1.35 net; by mail, $1.50.

John Merridew is a typical, thoughtless, sport-loving Englishman, and the idea of the book is to show how his character developed for the better, under the political, religious, and social influences that are described in the story.

"A stirring, sensational novel which grips the reader's attention."—*The Pall Mall Gazette.*

"It is an excellent story, full of the Italian atmosphere, with exciting moments and a genuine sentiment that makes for the romantic spirit. Criticism apart, we have enjoyed it extremely."—*The Sunday Times.*

Individualism

Four Lectures on the Significance of Consciousness for Social Relations.

By WARNER FITE, Professor of Philosophy in Indiana University, Author of "An Introductory Study of Ethics." Crown 8vo. pp. xx+301. $1.80 net; by mail, $1.92.

". . . . . Prof. Fite's study is of particular interest to students of philosophy, for he takes issue with Professor Royce, Prof. Dewey and other present-day philosophers on certain basic concepts, but the more general reader will also find the work helpful in getting his bearings as an individual and a member of society. Something of Nietzsche's robustness and self-respect, without his ruthlessness, and of the Utopian's idealism, without his mysticism, are discernible in the philosophy of life here set forth."—*Springfield Republican.*

Dublin University Press Series

A History of the Theories of Aether and Electricity, from the Age of Descartes to the Close of the Nineteenth Century

By E. T. WHITTAKER, Hon. Sc.D. (Dublin), F.R.S., Royal Astronomer of Ireland. 8vo. pp. xvi+476. $4.50 net.

THE TERCENTENARY OF THE

AUTHORIZED VERSION OF THE HOLY BIBLE

Special Commemorative Editions

I. A photographic facsimile in a slightly reduced size (11¾ x 8¼ inches), but containing all the characteristics of the original of the 1611 Bible in **Black Letter,** printed on rag-made paper. Edited, with a bibliographical introduction, by Alfred W. Pollard, M.A., Assistant Keeper of Printed Books in the British Museum.

The volume consists of 1550 pages and contains the Translators' Preface to the Reader, the Calendar, and all the material contained in original copies of the King James Bible.

This commemorative volume has been specially prepared for libraries and for those who wish to possess the King James Bible in its original form. In Cloth Binding, $15.00.

II. An exact reprint in roman type of the Authorized Version of 1611, edited, with a bibliographical introduction, by Alfred W. Pollard. Size 8 x 5¼ inches. Mr. Pollard's bibliographical introduction is the same as in the larger volume, but the smaller edition lacks the illustrative documents. Printed on Oxford India Paper, and Bound in Cloth, $4.50.

III. **Records of the English Bible:** being the documents (sixty-three in number) relating to the translation and publication of the Bible in English, 1523-1611. Edited, with the Introduction already described, by Alfred W. Pollard. Crown 8vo. (7½ x 5 inches.) Cloth, $2.50.

This volume will be found a valuable work for Students of the Bible; it contains documents, never before printed, which throw great light on the subject.

STUDIES IN THE SYNOPTIC PROBLEM. By Members of the University of Oxford. Edited by W. Sanday, D.D. 8vo, cloth, $4.15.

Interesting Paragraph from "The Sphere"

Issue of June 25, 1910: "Meanwhile some American newspaper has been chiding Mr. Archer upon too great an enthusiasm for the American magazines, and has even suggested that America is not so well off as our own country in weekly newspapers. This complaint, however, comes from Chicago, where New York is said to be less loved even than London. As a matter of fact, the New York NATION is a more thorough and more scholarly paper than any that we have in England. Compared with some of the reviews upon well-known books in the New York NATION, those in *The Spectator* are positively illiterate."

Letters and Memorials OF Wendell Phillips Garrison

Editor of The Nation, 1865-1906

In one volume, crown 8vo, 300 pages, with photogravure portrait.

During the forty-one years in which he edited the *Nation*, with a thoroughness, ability, and conscientious devotion unsurpassed in the records of American journalism, Mr. Garrison was an indefatigable correspondent, never employing an amanuensis, but writing tens of thousands of letters with his own hand to his contributors, who embraced practically all the leading American scholars and critics of the period. From a dozen groups of these, which have been kindly loaned by the recipients, a sufficient number of selections has been made to illustrate the relations between Mr. Garrison and his great corps of contributors, the frankness and tact which he exercised towards them, and the wide range of his interests, tastes, and sympathies. The volume also contains a brief sketch of his life, a dozen of his best poems, and several of his characteristic editorials, reviews, and essays, besides a fine photogravure portrait.

BOSTON NEW YORK

The Nation

NEW YORK, THURSDAY, APRIL 13, 1911.

The Week

The Democratic leaders in the House continue to indicate a most sensible programme. Following the assurance that there is to be no unnecessary manœuvring for political effect in regard to the Canadian reciprocity bill, there comes the statement that another bill is to be introduced at the same time, providing for the lowering of the tariff on a number of articles in which farmers are interested as buyers and not as sellers. In the farming communities along the Canadian border there has been a very natural feeling that in the reciprocity arrangement they were asked to give up some of their tariff advantages, while those to whom they were paying tribute through the protective tariff were permitted to enjoy their special privileges unabated. A downward revision of the tariff on wire fencing, agricultural implements, sewing machines, lumber, meats, and flour, which are among the items mentioned as likely to be included in the proposed bill, would be heartily approved by public sentiment generally, and would be to the farmers an extremely welcome recognition of their right to consideration.

Representative Foster of Vermont is one of the ablest and most responsible men in the House. As a member of the House Committee on Foreign Affairs, he speaks with additional authority. Yet he has no hesitation in declaring publicly that the latest attempt to manufacture a Japanese war-scare by way of the City of Mexico is part of a deliberate jingo policy to force large naval appropriations. These are his words:

> I am absolutely convinced that there is a criminal conspiracy on foot for the purpose of bringing on a war between the United States and Japan. Thousands upon thousands of dollars are being spent to carry on this propaganda, and I am confident that the plans of these conspirators will unfold themselves before very long. I am convinced that this constant agitation for a war between the two nations is nothing but a subterfuge employed by those people who are determined that this government shall buildnot less than two battleships each year. To endanger the friendly relations of two great nations in order that certain selfish interests may be gratified is nothing short of criminal.

This is precisely in keeping with what many outside of political life have been saying for years past—that the rumors of war with Germany or Japan which have regularly appeared year in and year out during the last decade are the deliberate work of those who would profit by an international conflagration.

In taunting Speaker Clark upon the reduced prestige of his office, Uncle Joe is true to his own standards of delicacy and humor. "Aren't you sorry now that you voted last year for a Committee on Committees?" asks Mr. Cannon. The point would stick if last year's uprising against the powers of the Speaker had been a partisan move directed by a Democratic minority against a Republican presiding officer. For a man of that stand-pat temperament which never forgives and forgets, Mr. Cannon has very quickly forgotten the fact that he was deprived of his powers by a revolution within his own party. If Speaker Clark stands to-day shorn of important prerogatives, it is chiefly because Mr. Cannon demonstrated that there may be Speakers who are unfit to be trusted with them.

With a fine display of authority, Mr. Bryan has set apart the Democratic sheep in the United States Senate from the Democratic goats. Coming from Mr. Bryan such an act of segregation must be very embarrassing—to the sheep. When war broke out within Republican ranks in the Senate, progressives and reactionaries alike were fortunate in being left to their own devices. The worst that could then be said of Aldrich and La Follette was that they were in the wrong; no one accused them of dancing to the crack of an outsider's whip. That is the unhappy fate which threatens the Democratic progressives if Mr. Bryan abides much longer at Washington and continues to emit pontifical utterances. By what right Mr. Bryan issues orders and distributes praise and blame, we fail to see. Does he really find in the recent Democratic victory a vindication of himself? Has he stopped to think how much he contributed to that victory by his absence?

The public reputation of Tom L. Johnson, which came to be national, was largely identified with his long contest to procure a three-cent fare on the street-railways of Cleveland. Our customary American facility in giving nick-names made him known as Three-Cent-Fare Johnson. In the obituary notices it is freely stated that he failed in this great fight of his life; but this is inaccurate. He was, indeed, beaten in his last contest for the Mayoralty, but a good part of what he strove for is now established in Cleveland. On some lines and for certain distances, there is a three-cent fare in that city. And even if the event shows that the three-cent fare cannot be made universal in Cleveland, that will but slightly diminish the value of what Johnson achieved. For the question of the fare, more or less, was only a part of the object he fought for. His great aim was to bring about an entire change in the attitude of the people toward public-utilities corporations, and in this he won a success which nothing can dim. Mayor Johnson was, indeed, a leader in what we can now see to be a revolution effected. The old conception of an indifferent public on the one hand, and scheming and overbearing companies on the other, has passed away almost completely.

Little by little Mr. Johnson worked out a change of attitude in Cleveland toward the whole problem of municipal administration. He was, of course, a party man and a politician, and "played the game" with the best of them, but in certain matters of high civic importance he would not allow the government to be thought of as merely a dispenser of jobs, or a system of outdoor relief for needy political dependents. If the city's water-supply needed to be overhauled and regularized, he put a competent scientist at the work. So, too, in matters affecting the police and parks and public playgrounds and the lake-front and the much-needed union railway-station, Mayor Johnson took his stand on large principles more often than upon small politics. For all these reasons he deserves to be thought of as one of the earliest and most successful to enter upon the great work of renovating the public life of American cities.

Judge Sanborn's decision on Saturday against the Minnesota Railway Commission was only what was expected after the report on the facts made last year by a special master, yet it has considerable importance. When we reflect that the opinion was handed down by the same Federal judge who held the Northern Securities Company illegal and also decided against the Standard Oil Company, we perceive that the courts will prevent confiscation even if they strike down monopoly. And it is mainly on the ground that the orders of the Railway Commission would prevent a fair return on railway property that the court declares them unconstitutional and void. By reducing passenger fares 33 per cent. to 2 cents a mile, and directing nearly as large cuts in commodity rates, the Commission had not merely interfered seriously with interstate commerce and brought about discrimination between localities, but had disabled the roads from earning a fair return on their property. The basis on which the capital is figured is virtually the cost of reproduction, rather than the market value of stocks and bonds, but the court decides that interest on the cost of reproduction of railway property at 4 per cent. "during one-half the time requisite to acquire and construct it," is a "necessary expense of reproduction and may be lawfully allowed as such." It has often but erroneously been said that the Supreme Court of the United States has fixed 6 per cent. as the rate of interest which public-service corporations may be allowed to earn. What was really decided was that such a rate of interest in the case of the Consolidated Gas Company of this city was "not unreasonable." Judge Sanborn now holds that "a net income of 7 per cent. upon the value of railroad property in Minnesota . . . is not more than the fair return to which a railroad company is entitled under the Fourteenth Amendment." This only shows that the courts will properly allow for differences in time and place.

The trade unions, we imagine, will utter no protest against the decision of the United States Circuit Court of Appeals in the Danbury hatters case. And yet the principle underlying the reversal of the lower court's judgment against the Hatters' Union is precisely the same principle that is involved in other decisions which have been criticised as being animated by hostility to Labor. This is the very commonplace principle that judges cannot make the law, but can pass only on the question whether the law has been applied properly in a certain case without violating the rules of judicial procedure. Upon the second point is based the quashing of the lower court's findings in the hatters' case. The Circuit Court of Appeals declares that the Connecticut judge was in serious error on several points, and primarily in directing the jury to bring in a verdict against the Hatters' Union. The jury was thus prevented from passing on the validity of the evidence submitted and the case of the defendants was correspondingly prejudiced. A new trial is to be had, but the illegality of boycotting stands affirmed in the same pronouncement that orders a new trial.

It would be a pity if the flaring headline should be allowed to prejudice thoughtful readers against the valuable and conscientious report just made public by the committee which has been investigating conditions in the underworld of Chicago. "Chicago's annual toll to vice is $60,000,000"; thus the truth is blazoned forth on the theory that all the sins and ills of humanity are now best translated into terms of dollars and cents. The annual homicides in the United States cost us so many millions of dollars; the number of miners entombed during the last twelve months represents the loss of so many millions of dollars; the number of babies who die for lack of pure milk represents the loss of so many more millions of dollars! The inhumanity of the argument is all the more inexcusable because it is an absolutely ineffective argument. Is the man in the street very likely to be roused by the thought of a hundred million highly metaphysical dollars that he cannot even imagine, let alone hope to see? A month ago, in speaking of the loss of lives by fire, the scientific commentator might have told us how many millions of dollars are lost annually in the form of factory people who are burned up. But it was not the capitalized value of 145 lives that recently stirred New York to horror.

The result of the Democratic primary election in Baltimore is not encouraging to those who are sanguine as to the near approach of the adoption of sound ideas of municipal government by the mass of the voters in our great cities. Against the winning candidate, Mr. Preston, there were, indeed, no accusations of personal unfitness; but the contest was nevertheless a clear-cut one between domination of the city by a political ring, with a coarse boss of the worst type at its head, and the retention in the Mayoralty of a perfectly "straight" and "regular" Democrat who had failed to satisfy the boss in the conduct of his office. An extraordinary effort was made by many of the most prominent and public-spirited citizens of Baltimore to achieve the renomination of Mayor Mahool, but the candidate of the ring beat him by 9,000 in a total vote of 50,000 at the primary. It is evident that there is still plenty of work to do in the way of getting "the plain people" to place their interest in honest and efficient government above their attachment to the party "organization."

New Hampshire has done its duty by the Crawford Notch. Gov. Bass has received a bill, duly passed, providing for the purchase by the State of the forests on the sides of the mountains through which, as the dispatches put it, the Notch "cuts its picturesque way to the heart of the White Mountains." The larger value of this action lies in its effect upon other Legislatures. It is a fine thing to save a piece of natural beauty for the enjoyment and the elevation of the generations that are to be, but, incidentally, one instance of the kind is worth tons of arguments with reference to similar action elsewhere. Owners of masterpieces abroad, and even the countries where they live, may have to perform a sacrifice in order to save them for the nation. With our States, debt-ridden as they are, no such obstacle opposes the appropriation of whatever amounts may be needed for the preservation of nature's wonders in their original majesty.

The proposed creation of a chair in political science at Princeton University for ex-Mayor McClellan should go far toward encouraging that friendly relationship between politics and scholarship which is one of the newer phenomena of the times. He probably knew more about Venice than any

other man who ever made a mess of it in New York. Nor would it be raking up dead fires to recall that during the storm and stress of his four years' term as Mayor he often evinced a peculiar aloofness from earthly circumstance that was more suggestive of academic shades than of the City Hall. His example cannot be held to prove one thing or another about the college man's qualification for an active career in politics. Whether the result be success or failure, it is not the college man, but the man, who has succeeded or failed. At Tammany Hall, of course, the appointment of Mr. McClellan to the Princeton faculty would be received with wonderment. It is conceivable that a professor should want to be Mayor of a large city; but why a man who has been Mayor should want to sink to a professorship staggers comprehension.

The misfortunes of the New Theatre give point to the suggestion, made in the last number of *Science*, that there is room for a new profession, that of acoustical engineering. Although the laws governing the perfect distribution of sound in an auditorium have not been completely worked out, our writer maintains that the theoretical results obtained by physicists are far in advance of what architects have been putting into practice. The difficulty is that the physicist is not concerned with the practical problems that confront the architect, while the architect is concerned with many important problems other than that of acoustics. Hence the necessity for a specialist to mediate between the two. The suggestion is an attractive one. If science can work out approximately true acoustic formulas for halls of various types, the architect's function would then be reduced to the problem of putting this model space into the handsomest shell he can devise. At present the auditorium is too often scooped out within the solid mass, instead of having the exterior frame the interior.

For an American to rank Canada with Abyssinia or Siam, especially with reciprocity pending, would be untactful. But when those on the other side of the border do it, one can only sympathize. Their trouble is the lack of a national library. There is the Library of Parliament at Ottawa, but that is a legislative library. Our own Library of Congress, says a Canadian complainant, furnishes a brilliant example of a legislative and a public library in one, but it is not a usual combination, and, as he sweeps his melancholy eye over the earth, he is depressed as he sees that even the South American republics have each their Biblioteca Nacional. But he has practical suggestions to offer. For a long time the Library of Parliament has been overcrowded, and the authorities have halted between finding room for the excess of books elsewhere, and erecting a new building. Now comes the suggestion of a national library, with removal to a centrally situated building of all books that would naturally go with such an institution.

On the same day last week questions were asked of the Government, both at London and Paris, respecting Canadian reciprocity, their point being whether the reductions of duty made by the United States on Canadian imports could not be claimed by France and England also under the "most-favored-nation" treaties. The cautious answer was given in both cases that due inquiries would be made. There cannot, however, be any doubt on this subject in the mind of the officials of either Foreign Office. They know what the uniform practice of the United States has been in the matter of reciprocity agreements. It was stated as early as 1817 by John Quincy Adams, to the effect that the most-favored-nation clause covers "only gratuitous favors" and does not touch "concessions for equivalents, express or implied." In the case of Canadian reciprocity, of course, every concession made by us is for an equivalent concession by Canada. For every *quo* there is a *quid*. Hence there can be no doubt what the attitude of our State Department will be if approached by the British or French Government. It will be the same as that of Secretary Olney in 1894 in reply to Germany, namely, that in the question of given concessions "no other country is entitled to them except upon rendering the same equivalent." The case would obviously be different if Senator Cummins were to have his way and add to the list of free imports from Canada, outside of the bargain. As Mr. Root pointed out in the Senate, such additions would be "gratuitous," and therefore, under our most-favored-nation treaties, would have to be extended to other countries equally.

The signing of a satisfactory commercial treaty between England and Japan is another blow to the British protectionists. They had dogmatically asserted again and again that without English tariff duties it would be impossible to make a bargain with any other nation in matters of commerce. The thing was clear as arithmetic. If you have no tariff rates to lower, how can you ask another country to lower hers? Mr. Balfour urged the point in the very instance of Japan. Her Parliament had lately voted an increase in the Japanese customs duties, some of which would bear heavily upon British trade. But an impotent Liberal Government, stupidly clinging to the worn-out formulas of free-trade, would be absolutely unable to do anything in the premises because it would not be in a position to threaten tariff reprisals. Mr. Asquith, however, calmly invited the Conservative leader to wait and see; and what he sees now is the negotiation of a treaty highly favorable to British commerce. Japan makes large reductions in whole classes of duties on English goods.

The impression created by the Camorrist trial at Viterbo is not only that the spectators are getting an excellent show for their money, but that the prisoners are getting a very fair trial for their lives. It may be safely asserted that European criminal jurisprudence, as descended from the Roman law, is not the dreadful thing which we, as a people happy in the possession of a Common Law, are frequently apt to assume. The charge that European tribunals start with the assumption of the prisoner's guilt and not his innocence, is probably more epigrammatic than true. In any case, it is not to be denied that at Viterbo the accused, each in his turn, are getting the fullest hearing that a man on trial could possibly ask for. Add to that the apparent privilege of proclaiming in open court and in quite untechnical language that personal justification which the average man aches to blurt out in defiance of lawyers' ways, and there is no reason for characterizing the proceedings at Viterbo as anything but fair—whatever else they may be.

A SYMPHONY IN K FLAT.

For some months it has been evident that the beneficiaries of the tariff duties on woollen goods—Schedule K—have been uneasy and apprehensive. It was bad enough to have President Taft declare the rates which they got in the Payne-Aldrich bill "indefensible." But when they learned that the Tariff Board was looking into their protectionist rake-off, and that the Democrats were proposing in the extra session to put through a bill cutting down their duties radically, they began to exhibit a fearful looking-for of judgment. They had a convention in Washington to show what benefactors of the people they are and to make the threat that whatever member of Congress might touch a fleece of yon gray sheep should die like a dog. Later, they began a campaign, not of education, but of advertising. In sixteen magazine pages, the American Woollen Company has set forth, we will not say a defence, but a glorification of Schedule K, which it shows to be the very article of a standing or falling republic. The whole is written in a tone of almost religious exaltation, of which one can hardly be expected to follow the dithyrambic reasoning, but before which the proper emotions are certainly wonder and awe.

One of the earliest strains of this music about the wool duties reveals the hitherto unsuspected truth that they decided the issue of the civil war and saved the Union. We have often heard of the wool tariff of 1867, but our advertising symphonist reminds us that Schedule K really came into being when the fate of the nation was at stake. It was first seen in a bill signed by Abraham Lincoln. That name is printed in black-faced type, and then our young-eyed cherubim goes choiring on:

> What were the immediate results?
> Our soldiers were provided with the needed uniforms. Victories were won. War was ended. All this is history.

Thus we see that any attempt to revise Schedule K is not only un-Republican and un-American, but is the height of national ingratitude and really next door to treason.

We cannot follow our advertiser's further swallow-flights of song in "history." He tells us that, under free wool from 1894 to 1897, "nearly every woolmill in America was closed." Was it Sir Robert Walpole who said: "Don't read me history, for I know that history is a pack of lies"? But this symphony in K flat does not pretend to be strong on facts. Miserable interrogatories about rates of duty and prices and quality have no place in this grand sweet song about wool at so much a page. The idealist point of view is taken throughout. Wool and woollen clothing, protected 100 to 200 per cent., become a sort of sacred symbol of American hope and grandeur. Unworthy motives or anything like a suggestion of selfishness flees away. Note how the poetical advertiser, rising to the height of his great argument, disposes of the small-minded objection that all the information upon which Schedule K was framed "came from wool growers and woollen manufacturers":

> Where else should it have been secured?
> Does any business man expect practical, usable, technical information about his business from any save those acquainted with the business?
> Congressmen are mostly law-makers—not manufacturers.
> Their business is that for which they are elected—making laws.
> A tariff law must, necessarily, deal with complicated phases of many businesses—phases which are understood only by those engaged in those businesses.
> This is true of the tariff on wool.
> Schedule K is not easily understood by the average reader.
> But any—and every—part of Schedule K can easily be explained by wool growers, woollen manufacturers, or others directly concerned with the business.

But while the American Woollen Company thus, with Milton, has a soul like a star that dwells apart, it also lays upon itself the lowliest duties—moral, not tariff, of course. Accordingly it stoops even to meet the needs of the school-girl who wrote in her examination paper, in reply to a question about the "chief uses" of cotton: "The chief use of cotton is to make woollen goods." The advertisement takes up the "ridiculous" charge that "part-cotton" cloth is sold for woollen. In the first place, no law could protect any one against buying part-cotton cloth for all wool—"if they were wholly lacking in sense." It is only the protective tariff, we infer, that makes it safe for even idiots to go into manufacturing; in ordinary buying and selling they have to look out. Besides, "have you ever paid an all-wool price for part-cotton clothing?" If you have, you are, of course, a fool, and so your opinion does not count.

The advertisement closes in a grand climax *fortissimo*. The brasses crash heavily at the name of the President of the American Woollen Company, who pays for the orchestra. Then there is a series of triumphant outbursts. "Schedule K stands on its merits alone." "The case of K is now in your hands." Schedule K can be destroyed only by "ignorance, malice, or party politics." "All the five millions of people directly interested in the wool business believe in America for Americans." "They believe also in the Golden Rule." If it is not an anti-climax, we add that they evidently believe, too, in unlimited humbug and in throwing away their money. But, as they say, no law can prevent their doing it if they are wholly lacking in sense.

A MUNICIPAL DONNYBROOK FAIR.

If there are any citizens of New York who have been in doubt or ignorance as to the Hibernian character of their city government, they need only look about them now to see on all sides evidences of certain Celtic traits coming to the surface with the members of the Administration. The good, old Donnybrook motto, "If you see a head, hit it," is the order of the day on all sides. It must make many a recent immigrant from Ireland feel his hand grasp his patriarchal shillelah a little more tightly, as he beholds the grand mix-up in and about the City Hall, and recall to many a veteran the glorious days when to crack a landlord's skull was the happiest diversion of a crowded hour in Roscommon or Tipperary or County Kilkenny. There is not a day passes but somebody gets a black-eye or a rap on the head at the hands of a brother member of the Board of Estimate, with whom he chatted so pleasantly but a little while before in the presence of reporters, and the fun grows fast and furious, with no signs of any weakening as the blood is spilled. To be a member of the city government these days is, indeed, to know the thrill and zest of life. It is the *grand* time these gentlemen are having.

There is Mayor Gaynor, for instance. There is a noble fighter for you. Let him but get the idea that a man has "vice in his head," and there is no let-up for him until that head is pounded to a jelly so the vice can get out. It's all the sweeter task when one's adversary has the fine old South of Ireland cognomen Corrigan—nothing Orange about

him, praise be the Lord. Even a Prendergast—is it Prendergast of Sligo or Cavan?—is a worthy foe to give the lie to while saying that 'tis politics that bhoy's afther. Then there is Mitchel, too; what more natural than that the blood of the Fenians should be stirring in his veins? Could there be any joy in life greater for him than standing before a crowd and making a spectacle of his Honor the Mayor, or making him eat his words about the subway? There's McAneny, too. What county the other side of Hoboken his people came from we know not. That it was not far from Kerry we'll wager by the way he stands by his own when attacked, be it asphalt or a Miller, and by the good sound piece of advice he gave to the Irish members of the Board of Aldermen the other day about the new Building Code the people *will* have—more power to his elbow! There's a fighter, too, to please the saints. And those who cannot get their fill of fight by day, battle at night in the sessions of the subway committee. But what goes on there, and how many with broken heads they carry off each night, no man can say. And as for Charley Hyde, who could count the knives that's out for him?

It's catching, this grand battling of the big men. Already a stray American, who got into the Park Department by accident, Stover by name, is quarrelling with his landscape architect. In the Fire Department, there's trouble all the time, with Croker on top and the Commissioner with a German name, Waldo —Heaven be good to him—underneath. They do say that the Tenement House Department is quiet as yet, but it can't be for long, for there's a Murphy at its head. He will be at the Corporation Counsel next, the saints defend him! As for the police, they're clubbing themselves and not the thieves today—but what can you expect, when there's three such fine Irish gentlemen at their heads, as Cropsey of Monaghan, and Flynn of Donegal, and "Clem" Driscoll of Dingle Bay? How could there be peace and quiet, unless they fought for it? Then there's Tomkins, he of the Docks; he's out after Prendergast and Mitchel, and even up in the Bronx there's a grand row on between Miller and Thompson and one "Phil" Donahue of Tammany Hall, over the sewer pipes up there, with Messrs. Miller and Thompson singing:

But when they grew impertinint we simultaneous rose
Till half of them was Liffey mud an' half was tattered clo'es.

Now all this must be grand fun—in Ireland. We dare say that there it would be considered the best evidence that all was well in the body politic and that, besides proving the friendliest feelings among all concerned, there could be no better sign that the Government was alive and alert. But here it's different. There are still so many of these dull Americans about who don't know pure fun when they see it, that we fear there will be some serious public misunderstandings ere long. They have a curious old-fashioned idea that a circus is a circus and that its proper place, when not in winter quarters, is the Madison Square Garden. They feel that the City Hall was never built for a bear-garden. They know, too, that while there has been many a feat of ground and lofty tumbling within that ancient edifice and many an educated and well-trained animal performer on view there, the real place for these antics is elsewhere. So we are very much afraid that, if the present public three-ring circus continues, the spectacle will pall, and the ill-bred citizens who so far forget themselves as to complain to the Mayor about the police and to tell him what they want in the way of a subway will begin to protest loudly about all the rowing that is going on. Impertinent rascals that they are, they simply will not read Seneca or Epictetus or Lecky, and be quiet.

WRITTEN AND UNWRITTEN CONSTITUTIONS.

England appears to be on the eve of a constitutional change more important than any that has taken place since 1832, and in its nature more deep-seated than that brought about by the great reform bill of that year. The direct concrete consequences of the abolition of the Lords' veto may, indeed, be far less pervasive and far less immediately manifest than those that attended the popularization of the House of Commons; but the departure is in its essence more distinctly vital. If the impending change should go through as proposed, a very fair approach will have been made to single-chamber government; and the approach will be of such a character as totally to remove any serious obstacle to the explicit adoption of virtually complete single-chamber government. With the House of Lords constitutionally unable to interpose anything beyond a two years' delay to the execution of the will of the House of Commons in existence at any given time, the reduction of even this prerogative to one consisting merely of the right to compel reconsideration will be a short and easy step whenever a strong majority of the Commons may wish to take it.

Reports from England indicate that while the Unionist party in Parliament is making a vigorous and resourceful fight against the Government programme, sentiment in the country at large is by no means active. If a change in the written Constitution of this country were in contemplation, having a tithe of the importance or significance of this that is impending in England, there would unquestionably be among us a vastly more active agitation in the press and among the people on both sides of the question. That the comparative apathy existing in England is explainable by many circumstances connected with the history of the case is undeniable: the people have tired of aimless manœuvre and sterile discussions, the result is looked upon as a foregone conclusion; and furthermore this present situation is but the climax of a long series of somewhat similar ones that have arisen from time to time for half a century. But all this is insufficient to account for the comparative lack of interest; it must in very great measure be attributed to the difference between the part played by a written constitution and an unwritten constitution in the life of a nation. And the question thrusts itself upon the mind whether that difference—be it good or bad—is not destined to be greatly accentuated in case the present proposals, or their not improbable extension above referred to, should go into effect.

What the British Constitution would be with an omnipotent House of Commons is a question upon which the experience of the past affords no secure guidance. That England's unwritten Constitution has given her much of the benefit to be obtained from a written Constitution, while avoiding many evils and drawbacks that attend the operation of such an instrument, is unquestionable. Probably most thinkers on the subject would agree that the balance

has been decidedly in favor of the more indefinite and more flexible of the two systems. But flexible as the British Constitution has been in its usual operation, there has always been a latent possibility of making it rigid upon any extraordinary occasion; and this latent possibility has been operative psychologically, even when it may not have been brought patently into exercise. And for a long time back it has been in the powers of the House of Lords that this possibility has centred. The grievance of the Liberal party, that the House of Lords has been a check on legislation only when the Liberals were in office, cannot be disposed of in a word; there are real grounds for complaint. But on the other hand, it is in the very nature of a Constitution which shall not be a mere fiction that somewhere there shall exist a force which is intrinsically and permanently conservative. With us that force resides in our written Constitution and our Supreme Court; in England, with the steady advance of the popularization of the House of Commons, it has resided chiefly in the House of Lords. With the further progress of that advance, with increasing democratization of the nation itself, with the not very remote prospect of a paid membership of the House, it is difficult to see where that force could find lodgment. And so we may be approaching a time when the British Constitution, substantial in the past in spite of its vagueness, may become not only far more vague, but quite unsubstantial.

It may be that a great democratic nation, constantly confronted with vast material and governmental issues, may prove perfectly capable of dealing successfully with its problems without those restraints which we are accustomto designate as constitutional. Furthermore, it would be but a shallow view of the matter which did not take account of the mighty force of mere tradition, unembodied in any mechanism of checks and balances, as being at the heart of a constitutional system such as that of England; but these are days of rapid change, and half a century may see such a loosening of the hold of tradition as half a century ago would have seemed impossible. How much a written constitution like ours, or an unwritten constitution intrenched as has been that of England in the past, may be capable of doing in the way of preventing rash innovations which, once introduced, may be sadly repented, but may prove next to impossible to reverse, no one can say. In our own country, with the tremendous tide of change in conditions and in population with which we have constantly to reckon, it must, we think, be the inevitable conclusion of sober thought that, with all its drawbacks, our written Constitution—by no means unamendable, but difficult to amend—is an invaluable assurance of that combination of fundamental stability and reasonable progress upon which the great future of the republic must rest.

THE PLIGHT OF THE POET.

Mr. Percy MacKaye, in the *North American Review*, laments the hard case of the poet. "The poet has no professional vocation," and consequently is often compelled "to make an avocation of his highest powers." "Other workers in the fine arts—painters, sculptors, musicians, architects—may make their art their recognized calling." But the worker in poetry must derive his means of living from other sources than his real occupation. Even Alfred Noyes, "whose poetry is said to be self-sustaining," is at work on a play. Why wonder at a dearth of poets when society provides no vocation for them? There are other difficulties. "The cadences, the harmonies, the seizure by the imagination upon consonants and vowels, sounds which subtly evoke the human associations of centuries—these are addressed to the ears, not the eyes, of his audience." And "originally his audience was not a person, but a people. Homer sang to all Hellas—not from the printed page, but from the mouths of minstrels. Thus the very craftsmanship of the poet is based upon two assumptions which are seldom granted him to-day: The sung, or chanted, word: a plural audience." From all these causes, and others, the power of the poet with the people has waned, and can be revived only by a partial renascence of the older conditions. Specifically, the drama is for him, as it was for his predecessors in the days of Sophocles and again in those of Shakespeare, the nearest approach to a congenial vocation.

It must not be supposed that Mr. MacKaye is ironical in this appraisal of the drama as the poet's one great opportunity. To be sure, he is looking at it with a poet's eyes, remarking that the theatre is but half-aware of the weighty forces which are stirring it to rebirth. He also includes the revival of pageant, with its promise of vocation to the poet as such in the production of masque, ballad, and choral song. But it is obvious that even drama can supply employment for only those poets who can write drama, and they did not comprise a single great figure in either England or America during the nineteenth century, rich as that age was in the mass, the variety, and the quality of its verse. On the other hand, Mr. MacKaye reasons like a poet rather than a logician in his estimate of the necessity of the sung or chanted word and of the plural audience. Homer may have moved thousands by his singing, but Homer in the printed page has stirred his myriads; while Tennyson and Browning won virtually every auditor they ever had without so much as having seen him. The poet need have no fear about his chanting. Let him put it into his verses, and they will roll the echoes long after his own lips are still.

Must we admit that the power of the poet with the people has waned? "The inspiration of the ancient bards," declares Mr. MacKaye, "has never passed from the earth. It is perennially in the poet's heart. But it can never pass effectively into the hearts of the people through their eyes—from the pages of printed volumes or magazines." Are we, then, to betake ourselves, with our magazines under our arms, to those whose verses appear in them, in order that the inspiration which our eyes have failed to see may find effective passage into our hearts through our ears, as the poet lends to his rhyme the beauty of his voice? Macaulay, after demonstrating the impossibility of a modern poet, rang up the curtain, in his usual theatrical manner, upon one of the greatest of them. Mr. MacKaye gives one the impression that there are plenty of poets, but insists that they have no way of making their existence known. There is one man, however, from whom they cannot hide. Mr. Wallace Rice can put his finger upon "no less than seventy men and women" in this country "who are writing admirablo poetry, which will bear comparison with the best poetry of the English at any time." The circumstance that it is not read by anybody

is regarded by its discoverer as the very reason why it will survive.

When we leave fantasy and paradox for solid ground, we can only wonder why any one should deny our lack of poets or our appreciation of poetry. The best evidence of both facts is the eagerness with which we greet any promise of a poet. The popularity of Kipling, so long as he kept out of absolute bathos, is an earnest of the dazzling rewards that would be heaped upon a veritable singer. A more recent illustration is Francis Thompson, whose "Selected Poems" have been passing through several editions in England. As a British critic points out, Thompson's verse has characteristics of excessive waywardness of fancy and style which one might have expected to exclude him from his heritage of popularity for at least a generation, and yet it "has found its way to the hearts of lovers of poetry as Mr. Noyes's never will." Although "critics assign to some of the best of his poems not less than classic rank," they are popular with young men. The truth is that we are so eager for real poetry that we overpraise those who are more than mediocre. How many of our real singers have missed during their lifetime a substantial instalment of the fame that was to be confirmed by the ages?

This recognition is society's perennial call to the poet. An avocation, at first and for long, his work may be. It may be, as Mr. MacKaye says, that it is among those with independent incomes that most of the excellent names in English poetry are found. Nevertheless, if Burns had not won his immortality before he won his chance for material success, he would probably never have won it. Without unduly minimizing this limitation, it is to be noted that the poet suffers therefrom in degree rather than in kind. What is a painter, a sculptor, a musician, an architect, a novelist, an actor, an orator, to do while he is still on the way to the place where he can afford to give himself up to the demands of the highest in his art? What of the historian, without money or reputation to collect the materials indispensable to the composition of his epic? The poet can weave his tapestry on any loom, but canvas and marble are not to be had for the asking. The most precious element of all, time, is more easily his than it is of the worker who must resort to wood or gallery, to library or landscape. It may be hard and even cruel that things should be thus arranged, but they are, and it may be doubted whether society can much improve them.

THE "RAVENOUS SOCIAL PROGRAMME."

In writing an introduction to a recent volume on John Bright, Mr. Augustine Birrell refers to that statesman's life-long fight for economy in public expenditure. Especially valiant was that tribune of the people in opposing with voice and pen year after year the swollen outlay for military purposes. Mr. Birrell wonders what Bright would say if he were in the House of Commons now and speaking on army and navy estimates twice as great as those against which in his lifetime he pleaded and thundered. But then Mr. Birrell goes on to remark that even if men like Bright could to-day keep down or even nearly abolish the expenditure on armaments, the result would be only a temporary relief to the taxpayer, since "the ravenous social programme" would soon consume every penny that could possibly be got from taxation.

This is not put forward as an argument against disarmament. It really cuts the other way. If there is, as there undoubtedly is in every country, this enormous pressure upon public finance to provide the means for social betterment, the duty of statesmen to strain every nerve in order to prevent the waste of money on guns and ships becomes clearer than ever. A dollar saved from the arts of temporary destruction may mean more than a dollar gained for permanent upbuilding. On the other hand, there is reason to believe that some of the advocates of big and ever bigger navies and armies are more or less consciously influenced by the hope of staving off in that way political movements which they dread. By taking for military objects all the money available, they think to starve out the social causes which clamor for larger appropriations. As a matter of fact, however, those who pay taxes see the burden for both classes of expenditure steadily growing. Whether you look at Germany or England, France or the United States, you discover that the military budget and the peace budget enlarge side by side. If their united strain is not to become intolerable, it should seem that one or the other must soon be lessened.

In whatever way those competing figures may be adjusted, however, there can be little question that Mr. Birrell is right in looking forward to a steadily rising scale of public expenditure as a result of the ravenous social programme. Every legislator, every executive, feels its appeal and its force. There is a constantly rising demand for expenditure on hospitals and schools and good roads and public health and better housing for the poor. When we add the appropriations for the endless forms of investigation and inspection, and for the new governmental machinery continually created in response to some real or fancied social need, we get a mounting total that would affright an old-fashioned economist. And this is to say nothing of the more advanced and more expensive parts of the social programme which Mr. Birrell doubtless had in mind—old-age pensions, workingmen's insurance against sickness and lack of employment, the expropriation of land for the benefit of the small tenant, and so on. There is such a cry of "Give, give" heard on every side of public treasuries, great and small, that it is not strange that their traditional "watch-dogs" are frightened away.

Now, there is one thing to be noted in connection with this ravenous social programme in our own country at least, and that is that it does not proceed upon any definite or consistent principle. It is not the avowed Socialists who are pushing the social programme, with all its cost. They have their own ideas and aims and ways of working. For the time being, they may be found approving or at any rate demanding the various forms of governmental outlay which we vaguely call paternalistic or social, but by themselves alone they would not be strong enough to compass the object. The real moving force is that great and growing body of humane men and women who act in this matter not so much from a fixed conviction as from a philanthropic impulse. It is not a case of Socialism, or of any other definite doctrine, but of rule of thumb. Without stating to themselves a precise economic or political reason or principle, masses of people somehow find themselves at one in feeling that certain bad conditions of life can no long-

er be tolerated, that given facilities of civilization must and shall be provided; and then follow agitation and organization and protests and appeals to Governors and Presidents, to Legislatures and Congress, with the result that money is presently voted to clean up slums and build sanitary tenements and provide parks and playgrounds and regulate industry and care in a thousand ways for what we call the unfortunate or dependent classes. That is what the social programme chiefly means in the United States at present, and it is certain that it will long go on making fresh and large demands upon the public purse. We may not like it, but there it is, and it has unquestionably come not only to stay but to grow. It is not necessarily an enemy of economy in public expenditure, but it does hold out a very clear prospect that for every dollar the public economist can save the social reformer will stand ready to spend two.

One inference from all this is unmistakable. If we are going in for the social programme, we must be prepared to foot its bills. The tax is sure to run beyond our sympathies merely, and to hit our pockets. So that in the interest of frankness it ought to be understood that every man who advocates a new form of benevolent social activity on the part of government, is really advocating a new tax. It will not do to say in a large, Micawber way that the general resources are sufficient to meet the drain or that somehow the money will be found. The only way governments can find money is by looking for it and seizing it in the hands of citizens; and the latter may as well understand, first as last, that the social programme is a taxation programme.

THE INVASION OF NORTH AFRICA.

When Mr. Robert Hichens wrote the "Garden of Allah," he initiated one of the most impressive land reclamation schemes in history. It is only a half-dozen years since Mr. Hichens entered the Desert, and already the face of the great waste is blooming with novels and romances by British and American writers. The present spring season has brought us two or three Saharan books, with the promise of a generous crop when the printers' leaves begin to turn next autumn. From publishers' advance notices we evolve the picture of an endless line of high-powered automobiles, stretching along the hot sand roads from Oran and Algiers to Constantine, and on to where the cultivated land stops and the local color begins. The drivers of these high-priced automobiles are, needless to say, American novelists. They are in pursuit of the brooding desert silences and the hoary mysteries of the East, for which there is a perceptibly growing demand in the fiction market. India and Egypt have felt the demand; but for the moment the pioneer energy of our best-sellers seems destined to move along the road from the Mediterranean, through the wall of the Atlas Mountains to the oasis of Biskra, a name that has oddly enough escaped the attention of the expert in nomenclature employed by our largest manufacturer of soda-crackers.

Mr. Hichens has not merely given the impulse to this new invasion; he has decided its main characteristics in advance. In all forthcoming novels of the Sahara, we take it, there will be (1) enervated Europeans or Americans in search of Peace; (2) sensuous Oriental dancers; (3) Zouaves in red trousers, Chasseurs d'Afrique, with an occasional Foreign Legionary or a *goumier;* (4) fortune-tellers who read your fortune in the sand; (5) Arab curio-dealers with eyes of smouldering fire; (6) camels; (7) a pretty love story; (8) oases; (9) Arab guides of princely bearing and cameo-like cast of features; (10) *bournouses, hadjis, wadys, oueds, sidis,* and *babs.* Individual temperament and aptitude will, of course, embroider on the main pattern, but, in general, the atmosphere will be what we have indicated. The two most radical innovations to be expected are (1) the introduction of automobiles, which Mr. Hichens does not even mention, and (2) the injection into the brooding desert silences of something of that red blood and cheerful optimism without which it is hard to succeed in contemporary fiction.

The second hypothesis is not so visionary as may appear at first sight. Of one Desert novel, it is already asserted that its scenes are as clear-cut as the white houses of Algiers and its story is full of the mystery of the East. How a story of brooding mystery can be framed in a clear-cut scene, we do not profess to know; but since previous books by the authors of this particular story have sold by the scores of thousands, we have not the least doubt that they can do it, and have done it. As for the sociological implications of the new Desert literature, we have no doubt that it will be just as good a thing for the Arabs and the Desert as for the Feringhi novelist. Why should East and West be content to remain eternally apart? The thing to do, like practical men, is to get together. The East can give the West enough brooding peace to repair the wear and tear of a hard year at Newport and bridge. The West can supply the East with something of that "push" which the Orient must have, if it is ever to wake from its thousand-year-old dreams and develop progress, railways, standing armies, child-labor, anti-tuberculosis campaigns, fire investigations, automobiles, press-agents, book-reviewers, and nature-lovers.

Having seen that the novelists are now flocking to the Desert because Mr. Robert Hichens went there, it is next in order to ask why Mr. Hichens sought the Desert. The answer is that the world's visible supply of local color is becoming so rapidly exhausted that writers of fiction, an industry into which local color so largely enters, have been compelled to search the world for new deposits of this precious element. The crisis is exactly the same as that which confronts the platinum, rubber, and potash industries. Up to a few years ago, for instance, Italy and the Riviera supplied pretty nearly the entire demand for exotic fiction. To-day the Riviera and Italy are beginning to be spoken of as worked out, both for the novelist and the tourist. The trend has been steadily toward the equator. Capri and Sicily have been stepping-stones toward the African coast and Egypt. There is plenty of steam-heat to be had now in the shadow of the Pyramids, together with chefs and mechanical pianos equal to the best that London or Paris can offer. The oasis now furnishes its visitors the combined advantages of the Peace of Allah, the heart of an exotic civilization, and the most advanced methods in water-therapy and Swedish massage.

Our confusion of the novelist and the tourist is intentional. Between the two there has grown up of late years an intimate connection that cannot help being regarded with concern by the Baedeker interests. The local-color writer

has been pushing hard the classic authority on what is the proper fare for a drive for three persons in a two-horse carriage for two and a half hours outside the fortifications between 8 and 10 P. M. But one disadvantage of the new method has been that when the tourist reaches the scene of action he finds reality drab and pale by comparison with his preliminary reading in the novelists. That is why even the vivid tones of the Riviera and Italy are losing their appeal. The tourist movement is toward the great primary colors of the Desert, of Egypt, and of India. But here, too, the traveller finds the fiction writer close at his side.

WALTER PATER.

Whatever else one may say of Pater, however one may like or dislike him, he stands in the complex, elusive nineteenth century as a clear sign of something fixed and known.* But he performs this office not as a critic, as he is commonly reckoned; indeed, of the critical mind, exactly speaking, he had little, being at once something more and something less than this. It is, of course, legitimate to take the expression of life as it comes to the critic in literature, and from this to develop a philosophy and vision of the critic's own; and this rather than any weighing of relative values was the intention of Pater. Such an aim is entirely justifiable, but it is not justifiable to misunderstand or falsify the basis on which the critic's own fabric is to be reared. If he is true critic his first concern must be the right interpretation of the documents before him, and whatever else he may have to offer must proceed from primary veracity of intention or vision. Just here Pater faulted, or defaulted. He has much to say that is interesting, even persuasive, about the great leaders and movements of the past, but too often his interpretation, when the spell of his manner is broken, will be found essentially perverted.

This may seem a harsh judgment to pass on a writer who has been one of the main influences in later nineteenth-century literature, but it can be easily substantiated. In his three greatest works—"Plato and Platonism," "Marius the Epicurean," and "The Renaissance"—Pater has dealt with three crises of history; and in each case he has gravely, though in varying degrees, falsified the reality.

I.

"Plato and Platonism" is a book that every student of Greek and of life should read; it is in itself a beautifully wrought work of art in which each detail is fitted into its place as part of a total designed effect; but that effect, presented as an interpretation of Plato, is of a kind, it can scarcely be said too emphatically, that differs *toto cœlo* from what Plato himself meant to convey in his dialogues, and is gained by a wilful distortion of the facts of history. In one of his chapters, Pater gives a picture, based largely on Karl Otfried Müller, of the Doric life in Lacedæmon as the actuality which Plato had in mind when he conceived his ideal city-state. It is a picture of cool colors and deliciously subdued harmonies, an idyl beautiful in itself and not without lessons for the youth of to-day in its insistence on the sheer loveliness and exquisite pleasures that may flow from austere discipline and self-suppression. It has its own wisdom, as in the development of Müller's text, that "in a Doric state, education was, on the whole, a matter of more importance than government." But it has one serious defect: it is not true. This city, as the picture finally arranges itself, is simply not the cold, hard Sparta that stood on the banks of the Eurotas, but some idyllic Auburn wafted into some Arcadia of the imagination. At the end of the chapter, after giving a noble account of the training, or *askêsis*, by which the Lacedæmonian youth were drilled for life, Pater represents an Athenian visitor as asking: "Why this strenuous task-work day after day; why this loyalty to a system, so costly to you individually, though it may be thought to have survived its original purpose; this laborious, endless education, which does not propose to give you anything very useful or enjoyable in itself?" The question is apt, and Pater puts the answer into the mouth of a Spartan youth: "To the end that I myself may be a perfect work of art, issuing thus into the eyes of all Greece." The discipline of Lycurgus, that is to say, was to the end that the young men of Sparta might be "a spectacle, æsthetically, at least, very interesting" (the words are Pater's) to the rest of Greece! Really, a more complete perversion of history has not often been conceived. The institutions of Sparta, as the Lacedæmonian in Plato's "Laws" admits without hesitation, were ordered to the end "that Sparta might conquer the other states in war." Not the indulgence of vanity, however chastely controlled, but the law of self-preservation and the terrible survival of the fittest made the Lacedæmonians the most comely of the people of Hellas; they were warriors and the mothers of warriors, not æsthetes.

And this same misrepresentation extends through much of Pater's analysis of Platonism. Pater saw, as all who study Plato are forced to see, that the heart of Plato's doctrine lay in his conception of ideas, in his use and enforcement of dialectic or the process of passing from particulars to generals. But Pater saw also something in this process that militated against his particular notion of æsthetics, and he was bound, if he accepted Platonism, as it was his desire to accept all the great movements of history, to interpret Platonic ideas in his own way. The result is a curious "apology for general ideas—abstruse, or intangible, or dry and seedy and wooden, as we may sometimes think them"—as a means of heightening the momentary perception of particular, beautiful phenomena. Doubless to represent Plato as an enemy of the decent and comely things of life, as an iconoclast of art and poetry and music in themselves, would be to forget some of the great passages in his "Republic" and other dialogues, in which the practical effect of beautiful things upon conduct is largely recognized and in which beauty in the abstract is placed by the side of the True and the Good in the supreme trinity of ideas. I would even admit that much of what Pater says in regard to Plato's conception of beauty is sound and worthy of emphasis. He has done well in drawing out the element of discipline in the Platonic æsthetics—the value of the capacity for correction, of patience, of crafty reserve, of intellectual astringency, which Plato demanded of the poet and the musician and of every true citizen of the ideal republic. Plato, as Pater rightly observes, was of all men faithful to the old Greek saying, *beauty is hard to attain*. But Pater's interpretation of Plato ends in a creed which Plato would have rejected with utter indignation. To recommend the pursuit of ideas for the sake of lending piquancy to the phenomenal, to use the intellectual apparatus in order to enhance the significance of the particular object, to undergo philosophical discipline for the sake of adding zest to sensuous pleasure; in a word, to make truth the servant of beauty, and goodness the servant of pleasure, is to uphold a doctrine essentially and uncompromisingly the contrary of everything that Plato believed and held sacred. To follow such a course, however purely and austerely beauty may be conceived, is, as Plato says, to be ἥττων τῶν καλῶν, the subject of beautiful things and not their master. Plato taught that the perception of beauty in the particular object was one of the means by which a man might rise to contemplation of the idea of beauty in the intellectual world, and wherever he saw the danger of inverting this order, as Pater and many other self-styled Platonists have inverted it, he could speak of art with all the austerity of a Puritan. There is no sentence in the dialogues that cuts more deeply into the heart of his philosophy than the foreboding exclamation: "When any one prefers beau-

ty to virtue, what is this but the real and utter dishonor of the soul?"

II.

From the study of "Plato and Platonism" we turn naturally to the greatest of Pater's works, "Marius the Epicurean," and here again we are confronted by a false interpretation of one of the critical moments of history. The theme of "Marius," I need scarcely say, is the life of a young Italian who, in the age of Marcus Aurelius, is searching for some guiding motive amid the dissolution of all traditions. He sees the world about him, the world at least that has outgrown the ancestral belief in the gods, and has not sunk into frivolity or sad skepticism, divided between the two sects of the Epicureans and the Stoics; and the larger part of the story is really a disquisition on the effect of these opposed philosophies upon the human soul. In the choice of Epicureanism instead of the harsher Stoic creed as a preparation for Christian faith, Pater, I think, shows a true knowledge of the human heart. Pascal, it will be remembered, found himself fifteen centuries later face to face with the revived tenets of Epicurus and Zeno, which are indeed the expression of the two main tendencies, not of one time but of all times, of those who attempt to stop in a religious philosophy just short of religion; and Pascal, too, saw that the step from Epicureanism to Christianity was easier than from Stoicism. So far Pater in his account of the relation of the Pagan philosophies and Christianity was psychologically right, but his portrayal of Christianity itself one is compelled to condemn in the same terms as his portrayal of Platonism. Read the story of Marius at the home of the Christian Cecilia and at the service of the mass, and you will feel that here is no picture of a militant faith in training for the conquest of the world, of a sect looking for struggle and moral regeneration, but the report of a pleasant scene where the eye is charmed and the ear soothed by the same subdued and languid loveliness that seemed to Pater to rule in Sparta and the ideal city of Plato. No doubt it would be wrong, as Pater asserts, to set over "against that divine urbanity and moderation the old error of Montanus" (Montanism, it may be observed by the way, was at that date quite young, but in the romantic convention everything is "old")—to set up as the complete Christian ideal the "fanatical revolt" of Montanus, "sour, falsely anti-mundane, ever with an air of ascetic affectation, and a bigoted distaste in particular for all the peculiar graces of womanhood." It is well to avoid extremes in either direction. Yet if choice had to be made between the dainty voluptuousness of religion as it appeared to Marius, and the moral rigor of Tertullian, the great Montanist preacher who was contemporary with Marius, it would not be hard to say on which side lay the real Christianity of the second century. Against Pater's "elegance of sanctity," as he calls it, a Christian might exclaim with Tertullian that "truth is not on the surface but in the inmost heart." Pater, borrowing the phrase from Tertullian, describes the death of Marius as that of a soul naturally Christian. Beside that picture of a soul daintily dreaming itself into eternity set the apostrophe of Tertullian himself to the *anima naturaliter Christiana:*

> But I summon thee—not such as when moulded in schools, trained in libraries, fed in attic academies and porches, thou blurtest forth wisdom—I address thee simple, and rude, and uncultured, and untaught, such as he possesses thee, who possesses thee and nothing else; the bare soul, just as it is from the road, the street, the weaver's shop.

The simple fact is that in Marius we have no real conversion from Epicureanism to religion, no Christianity at all as it would have been recognized by St. Paul or St. Augustine, but that peculiarly languid æstheticism which Pater sucked from the romantic school of his century and disguised in the phraseology of an ancient faith. To write thus was to betray Christianity with a kiss.

III.

In the third of Pater's major works, "The Renaissance," there is again a reading of Paterism into the past, but without the offensiveness that is felt in his treatment of Platonism and Christianity. Not a little of the romanticism from which Pater drew his philosophy may be traced to the Italy of Botticelli and Leonardo da Vinci; but the tone, the energy, the *êthos*, are changed. The nature of the change cannot be better displayed than in the famous description of the La Gioconda in the essay on "Leonardo da Vinci," which is too familiar for quotation. Now I shall not criticise this famous passage for its treatment of plain facts. Those who care to see how far Pater has departed from the inconveniences of history may consult the monograph of Salomon Reinach in No. 2 of the *Bulletin des Musées de France* for 1909. And, after all, Pater was not dealing with facts, but with emotions; as a "lover of strange souls," to use his own phrase, he was analyzing the impression made upon him by this picture, and trying to reach through it a definition of the chief elements of Leonardo's genius. Yet viewed even in that light, the description rings false—not so false as his interpretations of Platonism and Christianity, but still subtly perversive of the truth. It may be true in a way that the genius of Leonardo, as Goethe said, had "thought itself weary"—*müde sich gedacht;* but the deadly and deliberate languor that trails through the lines of Pater—not, I admit, without its own ambiguous and troubling beauty—has no correspondence in the virile art of Leonardo. And whatever may have been the sins of Leonardo in the flesh, and whatever may have been his intellectual doubts or indifferences, he would not have understood that strange and frequent identification among the modern romantics of the soul and disease. Into the face of Mona Lisa, says Pater, "the soul with all its maladies has passed!" as if health were incompatible with the possession of a soul.

The simple truth is that Pater was in no proper sense of the word a critic at all. History was only an extension of his own ego, and he saw himself whithersoever he turned his eyes. To form any just estimate of Pater's work, we must forget the critical form in which so much of his writing is couched, and regard the substance of his own philosophy apart from any apparent relation to the period or person to which it is transferred. And here we are aided by the singular consistency of his nature. In his works all is of a piece, and all is the perfectly lucid outgrowth of an unvarying design and of a single attitude toward the world.

IV.

If we search for the sources of this design, apart from the original character of the artist himself, we shall find them without difficulty. Among English writers he himself would probably have ascribed the chief influence upon him to Ruskin, but as a matter of fact I suspect that the more dominating personal influence came from another and more insinuating mind. I do not certainly know that Pater ever met Rossetti in the flesh, but he recognized that great and sad genius as one of his teachers.

But however Pater may seem to have lighted his torch at Rossetti's flame, we must not overlook the strong impersonal influence that emanated from the memories and the very stones of Oxford. We all know Matthew Arnold's apostrophe to the "home of lost causes, and forsaken beliefs, and unpopular names, and impossible loyalties"; to the dream-city that "lies, spreading her gardens to the moonlight, and whispering from her towers the last enchantments of the Middle Ages." The call of Oxford is, as her lover says, to beauty and to higher ideals; but there is an aspect of her appeal which is not without its fascinating danger. From the beginning she has been the home of secluded causes as well as lost causes; she has stood always as a protest against the coarse and ephemeral changes of civilization, but she has maintained this centre of calm too much by a withdrawal from life rather than by strong control. Hers at her origin was the ideal of monasticism and of faith fleeing the world; her loyalty to the king was strongest

when loyalty meant a separation from the great powers of political expansion; her religious revival in the nineteenth century was not only the desire of resuscitating an impossible past, but sought also to sever the forms of worship entirely from the influence of the state and of the people. Certainly much good has come out of this pride of seclusion, and waves of spiritual force have continually emanated from this reservoir of memory; but it is true also that these influences have often ended in sterility or have tended to widen rather than close up the unfortunate gap between the utilitarian and the sentimental phases of English life. In a word, they have been too often a reinforcement to the romantic ideal of the imagination as a worship of beauty isolated from, and in the end despised by, the real interests of life, and too seldom a reinforcement of the classical ideal of the imagination as an active power in life itself. The very contrast of the enchanted towers of Oxford with the hideous chimneys of one of England's great manufacturing towns seems to give to the university an atmosphere of æsthetic unreality. Ideas do not circulate here as they do in a university like that of Paris, situated at the heart of the national life, and in too many of the books that come from Oxford one feels the breath of a fine traditional culture that has somehow every excellent quality—except vitality. And so it was not strange to see the Oxford Movement depart further and further from practical and intellectual realities and lose itself in an empty and stubborn ritualism. Thought is the greatest marrer of good looks, said Oscar Wilde, and that is why there are so many good-looking young curates in England. The æstheticism of William Morris and Burne-Jones was a conscious revolt from the vapidity of the later stages of the Oxford Movement to a pure and Pagan sensuousness. Rossetti gave body and passion to the revolt, and Pater, following in their steps, lent a scholastic authority to their artistic achievements. Paterism might without great injustice be defined as the quintessential spirit of Oxford, emptied of the wholesome intrusions of the world—its pride of isolation reduced to sterile self-absorption, its enchantment of beauty alembicated into a faint Epicureanism, its discipline of learning changed into voluptuous economy of sensations, its golden calm stagnated into languid elegance.

V.

In more than one passage Pater gives direct expression to his philosophy, nowhere else so explicitly as in the conclusions to his volume on the Renaissance. The motto of that chapter is the famous saying of Heracleitus, "All things are in a state of flux and nothing abides"; and the chapter itself is but a brief exhortation to make the most of our human life amidst this endless and ceaseless mutation of which we are ourselves an ever-changing element. That is the sum of Pater's philosophy as it is everywhere implicitly expressed in critical essay and fiction: the admonition to train our body and mind to the highest point of acuteness so as to catch, as it were, each fleeting glimpse of beauty on the wing, and by the intensity of our perception and participation to compensate for the brevity of the world's gifts; in a word, the admonition to make of life itself an art. Now, we ought, I think, to be grateful first of all to anyone who recalls to us and utters in manifold ways this lesson of the immediate perception of lovely things, of grace within answering to grace without. Perhaps no other philosophy to-day has so completely passed out of our range of vision as this doctrine of the art of living which has been one of the guiding principles of the great ages of the past. We are too hurried for this, a little too unbalanced between egotism and sentimental humanitarianism, a little too uncertain, despite much optimistic brag, of any real and immediate values in life. And there is much also to commend in the method Pater proposes for attaining this ideal. If he teaches that the art of life is to train our emotions, like a well-trimmed lamp, "to burn always with a hard, gemlike flame," he also endlessly reiterates the lesson that this joy of eager observation and swift response can be made habitual in us only by a severe self-discipline and moderation. Only when the senses have been purified and sharpened by a certain chastity of use, only when the mind has been exercised by a certain rigidity of application, do we become fit instruments to record the delicate impacts of evanescent beauty. In his essay on Raphael, one of the soundest of his critical estimates, Pater refers to the "saying that the true artist is known best by what he omits"; and this, he adds, is "because the whole question of good taste is involved precisely in such jealous omission." No one, indeed, has seen more clearly than Pater that virtue is not acquired by a rebound from excess, but is the exquisite flower of the habit of moderation.

Yet withal, the account with Pater cannot stop here, nor, if we consider the fruit of his teaching in such men as Oscar Wilde, can we admit that his teaching was altogether without offence. His error was not that he inculcated the art of life at all seasons, but that his sense of values was finally wrong; his philosophy from beginning to end might be called by a rhetorician a kind of hysteron-proteron. And this is visible in his treatment of the three great movements of history. Thus in his interpretation of Plato, we have seen how he falsified Plato's theory and use of facts by raising beauty, or æsthetic pleasure, above truth as the goal to be kept in sight. Now this may seem a slight sin, when, in extolling the one, nothing is intentionally taken away from the honor of the other. Pater would even say that as truth and beauty are the same, it makes no difference which of them you set before your gaze, and in this he would have the authority of many eminent predecessors. Are we not all fond of quoting the lofty words of Keats?—

"Beauty is truth, truth beauty"—that is all
Ye know on earth, and all ye need to know.

Perhaps, in some high philosophical realm that is the case; but it happens that in practice in this mundane sphere, truth and beauty are by no means always identical; and it makes a world of difference where you come out, according to whether you hold this or the other as your first desire when the divergence occurs. I have been struck by a passage on this theme in one of the recently published Japanese letters of Lafcadio Hearn—certainly no foe to romantic beauty. "They all [the romanticists] sowed a crop of dragon's teeth," he says. "Preaching without qualification, the gospel of beauty—that beauty is *truth*—provoked the horrible modern answer of Zolaism: 'Then truth must be beauty!'" Pater's misinterpretation of Plato was equally a misinterpretation of life.

In like manner, when Pater in his treatment of Christianity placed æsthetic satisfaction before religious duty, he really missed the goal of happiness he was aiming at. The old Scotch preacher Blair pronounced the sure answer to such an error many years before Paterism existed: "To aim at a constant succession of high and vivid sensations of pleasure, is an idea of happiness altogether chimerical. . . . Instead of those fallacious hopes of perpetual festivity, with which the world would allure us, religion confers upon us a cheerful tranquillity." Nor was Pater's fault in regard to the Renaissance essentially different in its consequences; it may even be that here, where his temperament would seem to be most at home, his subtle inversion of the facts, in making beauty and pleasure the sole purpose of life instead of the reward or efflorescence of right living, is the most instructive of all. Read Pater's exquisitely refined pages on Leonardo da Vinci, with their constant implication that beauty is a kind of malady of the soul, and then recall the strong, lusty soul of the Renaissance as it speaks, for instance, in the ringing lines of Chapman:

Give me a spirit that on this life's rough sea
Loves t' have his sails fill'd with a lusty wind. . . .
There is no danger to a man that knows
What life and death is—

recall the whole magnificent passage, and you will see why Pater's philosophy leads on inevitably to weariness, and satiety, and impotence. This exaltation of beauty above truth, and æsthetic grace above duty, and refined perception above action, this insinuating hedonism which would so bravely embrace the joy of the moment, forgets to stay itself on any fixed and unselfish principle, and forgetting this, it somehow misses the enduring joy of the world and empties life of its true values. It is for such reasons as this that we cannot finally accept Pater's philosophy of the art of life, notwithstanding all that may be said in its favor; that even his lesson of moderation and self-restraint, much as that lesson is needed to-day and always, seems at last to proceed from some deep-seated taint of decaying powers rather than from conscious strength. So intimately are good and evil mingled together in human ideals. P. E. M.

FOGAZZARO'S LAST NOVEL.

FLORENCE, Italy, March 29.

"Leila," the novel which Fogazzaro published shortly before his death,* is a continuation in a certain sense of "Il Santo," for, although none of the characters of the earlier work, save in one small incident, reappear in the later one, it is permeated with the same ideas and tendencies, and the hero of "Leila," Massimo Alberti, is the devotee of Pietro Maironi ("Il Santo") and a continuator of his tradition. I fear that the author's last novel will not add to his reputation; it has neither the technical and psychological merits of some of his earlier novels, notably "Daniele Cortis" and "Piccolo Mondo Antico," nor the inspired religious fervor of "Il Santo"; the style lacks vivacity, the plot is not convincing, the motives and personality of most of the characters are merely perplexing and unsympathetic, and the general treatment is weak. Leila Da Camin, the daughter of disreputable parents, but herself a fine character—at least, so we are told—was engaged to Andrea Trento, although she esteemed rather than loved him, and at his premature death was glad to get away from her own parents. She goes to live with his father Marcello, who desires to have her constantly by him as a reminder of his dead son. The son's most intimate friend, Massimo Alberti, a young Milanese doctor and a "modernist" of deep, if somewhat vague, convictions, comes to pay a visit to Trento, who conceives that a marriage between him and Leila would be in every way desirable. Massimo falls in love with her without realizing it, but Leila, thinking that he is merely an adventurer, after her fortune, treats him with absolute rudeness, so that he leaves the house crestfallen. Marcello Trento dies suddenly, leaving Leila his property; but as she is still a minor, her father comes to take temporary possession of it. A priestly intrigue is on foot to prevent her from ever marrying and to induce her to enter a convent, so as to get control of the Trento inheritance through her father—a time-honored *motif* in Catholic countries. A common friend, however, Donna Fedele Brayla, intervenes and brings Leila and Massimo together. Religion plays a very large part in the book, and we are told at great length what are the convictions of each of the characters. Leila and Massimo, who had almost lost all faith in the church, owing to the unworthiness of some of its members, regain it through mutual love; and after Leila has renounced the Trento inheritance in favor of her father, the couple retire to a mountain village, where Massimo will devote himself to assisting the poor as *medico condotto*.

Yet with all its faults, and they are many, the book has charm; the descriptions of the scenery in the Alpine foothills near Vicenza and in the Valsolda above the Lake of Lugano are delightfully fresh. La Montanina, the house where most of the action takes place, is a living and lovable personality, and many of the minor characters show the hand of a master. Above all there is the charm of Fogazzaro's own spirit. Even through bad workmanship and poor character-drawing, we always feel the deep sincerity and refinement of the author; he is always an artist and a gentleman, although his treatment may be often inartistic. As in "Il Santo" so in "Leila," we see Fogazzaro against hopeless odds ever fighting the good fight of reconciling traditional Catholicism with modern thought and modern science; in the former work the struggle is for the reformation of the church from within, in the latter for the regeneration of two souls. "I said to myself," writes Leila to Massimo, "all or nothing. As long as I could I accepted all. Then when I saw things more closely and found allied together the persons who incarnate the All—the *arciprete*, the chaplain, the *arciprete's* sister, my father, a certain Molesin, a friend of my father's, I could not resist and said to myself: better Nothing. But Nothing fails to satisfy me, and I ask you for a faith, glad that you are freed of your old beliefs, of your ideas of a Catholic renovation. I ask of you a God whom I can worship in the woods of Dasio, in the gorge of the cascade, on the waves of the lake, in a wedding chamber; who does not impose official intermediaries, who asks me only for love and forbids me only hate; who does not torture my intelligence with incomprehensible dogmas nor annoy me with tedious observances; who does not undertake to attract me with heavens or terrorize me with hells." L. V.

NEWS FOR BIBLIOPHILES.

The very remarkable collection of rare books which was brought together by the late E. Dwight Church, and which has been often referred to in this column, has been sold privately by the executors of Mr. Church's estate, through George D. Smith, the New York bookseller, to H. E. Huntington of New York city and Los Angeles, Cal. For its size, the Church library is without doubt the most valuable collection of rare books ever brought together. The elaborate catalogue under way for several years, and just nearing completion at Mr. Church's death, is in seven imperial octavo volumes, printed on Van Gelder paper made especially for the work in Holland, and with hundreds of reproductions of title pages. It cost upwards of thirty thousand dollars. The price paid for the collection has not been made public by either the purchaser or the seller. When the collection was first offered for sale it was held at a million and a quarter dollars, and this sum was given in the newspapers as the purchase price now. It may be stated, on good authority, that the sum paid by Mr. Huntington was approximately eight hundred thousand dollars, and, although this sum is a considerable advance upon the cost of the library to Mr. Church (exclusive of interest charges), it must be regarded as a low price. Mr. Huntington already owns a large and important library (he was the largest buyer at the Henry W. Poor sales, taking about one-third of the entire collection), and, if he retains the Church books and manuscripts, it will place his library very near the head among private libraries of the world. Mr. Church was, during a quarter century, the buyer of many of the rarest books, within his lines of collecting, that came upon the market. By the dispersal at auction of the Barlow and Ives libraries and the breaking up privately of the Kalbfleisch and Lefferts collections (and from other sources) he was able to bring together a collection of rare Americana such as would have been supposed impossible, ranking, for rarity and condition, though not in number of volumes, with the John Carter Brown and Lenox libraries. By the purchase of the Rowfant library, he put his Shakespeareana at the head of American collections, though in this department it is probably now surpassed by Mr. Folger's collection.

Mr. Hoe, at the time of his death, had printed, in an edition of one hundred copies only, a catalogue of his printed books, forming fifteen volumes. A catalogue of his wonderful collection of illuminated manuscripts was in preparation. Since his death this has been completed and printed. The volume describes upwards of two hundred and fifty manuscripts, ecclesiastical and classical, illustrating the art of the calligrapher, illuminator, and miniaturist from about 1200 till nearly the present day. A selection of seventy of these manuscripts will be sold at the twelfth session of the first Hoe sale, Monday evening, May 1. We have already noted the famous Pembroke Hours, perhaps the most valuable of the illuminated manuscripts. In this first sale is also included the almost equally important manuscript known as the Charles VI Missal. This is a fine manuscript of the fourteenth century, made for Charles VI of

France and given by him to King Henry V of England on the occasion of his marriage to Catherine de Valois, daughter of King Charles VI. It seems to have remained in the hands of Henry VI, Henry VII, and Henry VIII, but in the reign of the last-named it passed into the ownership of Jean Legrand and was sold by a certain Gilles in Antwerp for Legrand's account to the monastery of Tongerloo, where it remained for nearly three hundred years. In 1869 it was acquired by a Paris bookseller, by whom it was sold to M. Didot, and came up at auction with his library in 1879. Mr. Hoe acquired it with the Norton Q. Pope collection. It is very copiously illustrated, containing no less than 107 large miniatures, each (with a few exceptions) having on the same page four small miniatures, thus making the total of 529.

Another historic Book of Hours in the Hoe collection was made about 1477 for Anne de Beaujeu, daughter of Louis XI of France. This also is from the Didot collection. Thirteen other fine manuscript Books of Hours mostly of the fifteenth century are included in the first sale. Among notable secular manuscripts of continental origin are a fine Josephus in Latin, ascribed to the thirteenth century; another Josephus, in French, of the fifteenth century; Horace's "Opera"; Martial's "Epigrammata"; a late fifteenth century manuscript of the French poetical version of Ovid's "Epistolæ Heroidum"; and Petrarch's "Sonette, Canzoni e Trionfi," in a contemporary Florentine binding. Of several specimens of English execution Lydgate's "Lyf of Our Lady" and an early manuscript of Richard de Bury's "Philobiblon" are of special interest. Several illuminated Persian manuscripts and a fine specimen of the work of Nicholas Jarry, a noted French calligraphist of the seventeenth century, are also included. The Jarry manuscript is in an elaborate inlaid Trautz Bauzonnet binding, being No. 7 of twenty-six mosaic bindings executed by him.

The French books, in point of actual numbers, form the largest section of the Hoe library, upwards of a thousand titles being scattered through the two volumes of the Catalogue of this first sale. These are first and other early editions of the French classical authors as well as many beautifully printed modern books issued in very limited editions, some containing water-color drawings. Almost all are in handsome bindings by French artists or by the Club Bindery. A copy of "La Tribu indienne," a romance by Lucien Bonaparte, printed in 1799 but suppressed, is the only uncut copy of the three copies now known to exist.

LIBRARIES IN NEW YORK STATE.

The State Education Department received reports last year from 1,345 libraries in this State, of which 710 are free circulating libraries, and 635 are limited in use to particular institutions or associations. The stock of books reported in all the libraries was 10,094,246 volumes, and the total circulation for the year was 20,573,449 volumes. In the free circulating libraries there is a stock of 4,341,449 volumes, and the circulation in 1910 was 19,254,727 volumes. Compared with the figures reported a year ago, there has been a gain of 39 in the number of libraries reporting, 137,021 in the number of volumes in stock, and 657,163 in the circulation. For the free libraries, the gain has been 21 in the number of libraries, 113,437 in the stock of books, and 506,880 in the circulation.

These gains are not so great as have been reported in recent years, but they show that library expansion is still proceeding at a more rapid rate than the increase in population, and that such decreases as have recently been reported in a few of the cities of the State, and have been made the basis for discouraged comment, are purely local and exceptional. In estimating the significance of the gain reported, it must be borne in mind that this is the seventeenth successive year in which gains have been shown, and that in this period free libraries in the State have increased in number from 238 to 710, in stock of books from 849,000 to 4,341,000, and in circulation from 2,293,000 to 19,254,000—a gain of 300 per cent. in number of libraries, 500 per cent. in stock of books, and 850 per cent. in circulation. Even during the last five years there has been a gain of 100 in the number of libraries reporting, of 1,000,000 in the number of volumes, and 7,000,000 in circulation. Since the enactment of the present library law in 1892 the circulation from free libraries has grown six times more rapidly than the population of the State.

Of the 710 free libraries reporting this year, 462 are in direct relation with the Education Department, and are privileged to draw an annual grant of $100 each from the State for the purchase of approved books, provided they apply the same amount of their own money for this purpose. The amount thus apportioned by the State last year was $32,915, divided among 370 libraries which applied and qualified for the grant. The total amount of local taxation for the support of libraries was $1,471,022, an increase above the previous year of $34,090. In addition to school libraries, some of which are free to the general public, 281 libraries are now receiving local tax support. Of the 49 cities of the State, all except Watervliet, Cortland, and the new city of Lackawanna have free or public libraries, and of these, 40 make an annual appropriation for library purposes. Of the 118 villages with a population of above 2,000 each, 92 have free libraries, 52 of which are supported by local taxation. Two hundred and nineteen, or nearly one-half, of the free libraries connected with the State Department are in villages or hamlets of less than 2,000 population. Of the 451 incorporated villages of the State, 231 are provided with free libraries and 220 are without such facilities. Outside of incorporated places, there is a population in the State of 1,500,000; for this population there is a total of 85 free libraries. Assuming that each of these libraries is available to as many as 1,000 people—a very liberal estimate, there is left a rural population of 1,400,000 entirely without library privileges. Adding to this the population of incorporate places not having libraries, it will be seen that at least a million and three-quarters people are without public library advantages.

The following libraries have completed and occupied new buildings during the year: Heermance Memorial of Coxsackie, Normal School Library of Geneseo, Mt. Morris Free, Seward Park branch, New York city; Olean Public, Pleasant Valley Free, Portville Free, Jermain Memorial of Sag Harbor, Margaret Reaney Memorial of St. Johnsville, Saranac Lake Free, and David A. Howe Library of Wellsville. Only one of these was a Carnegie gift, and, among the 52 gifts recorded the past year, but two were from Mr. Carnegie. Numerous and conspicuous as the Carnegie gifts have been, it is worthy of note that in this State, outside of Greater New York, of the 146 different places receiving gifts of buildings the last seventeen years, only 31 were from Mr. Carnegie, while 115 were from other donors.

Correspondence

THREE ARTISTS IN BOSTON.

To the Editor of The Nation:

Sir: There is at present in Boston an exhibition of paintings worth more than local notice. When three artists, taking a gallery together, hang it with white and panel it with evergreen, and show but fourteen of their works, their taste and reserve suggest stronger qualities. The quotation from Kipling that heads their catalogue—

> There are nine and sixty ways
> Of constructing tribal lays,
> And every single one of them is right—

is both a promise of independence and a challenge to criticism. On examination, the exhibition by Messrs. Hopkinson, Prendergast, and Pepper shows strength and individuality in all three men.

Mr. Charles Hopkinson's five pictures cover a wide range in treatment. That his technique is sober and even old-fashioned shows especially in his two portraits. These are splendidly direct studies of personality, without a trick or a flourish, indeed, without an accessory in the composition, to distract attention from the characters of the sitters. His Marine is but rocks and surf and sky; its lighting is of the late afternoon; the work is as sober as the portraits, but shows in its haze of color and its truth of distance, and in the flash of the restless crests, the suggestion of wider powers. These are set free in the remaining two pictures. Arranging Flowers is a study in pure color; the composition is simple enough, but the woman in white at the table, the scattered nasturtiums before her, the green chair and curtain, the Japanese doll, among them take all the upper notes of the gamut, but always in harmony. The Wonderful Island is scarcely a second marine—it has too much landscape; is scarcely a landscape, for it has too much of sea. Into the foreground sweeps the bough of a pine; below this stretch the tops of trees in varied green; still further down lie the tossing waters of a cove; and beyond this rises up the islet, lying in sunset light. The shadows of the rocks are blank pale purple; the lighted crags, and the waters below them, are dark and rich, the strong notes of the picture; the isle is crowned with trees whose autumnal foliage glows in the evening but is softened by the distance. To the left is the inlet from the harbor, and beyond the island lies a broad water, at whose limit shows, faint in the haze, the further shore. The composition is unusual in its effect: line as well as color centre upon the island in the middle distance, a place for childhood's strange ad-

ventures. This quiet and yet strongly imaginative piece forms the fit centre to the four paintings which flank it.

Mr. Maurice Prendergast is more individual in technique than either of his friends, and more certain to rouse opposition, if not resentment. Yet his mosaics of color patches melt at a slight distance into the required effects of light and air, of people and of natural objects. One must not inquire too closely the sex or the age or the employment of his small figures; but with him a crowd is a crowd, a building is solid, and sea and sky are real. The recent advance in his work is revealed by the presence of an earlier piece, subdued and of tapestry quality beside the glowing color of his recent paintings. Mr. Prendergast has command of atmosphere and distance. His most pleasing work is Brimstone Corner, in which the handling of the old Park Street church, the snow-clad Common, the hurrying people, and the smoky sky, is less mannered than in the other pictures. Though Mr. Prendergast is often a little beyond us, his virtues are very real.

The special quality which marks Mr. Pepper's four figure pieces, beyond the interest in color which is characteristic of all three men, and which does much to unify the exhibit, is a peculiar absorption in the personality of the sitter. In these life studies the pleasurable sweep of line shows a different method of attack from Mr. Hopkinson's directness; nevertheless, Mr. Pepper also centres interest in the face. This is shown especially in his group of three, of which each serves to emphasize the others. The lady with the veil, who seems to add charm of mind to charm of person, contrasts with the Widow who reveals the devastations, the still present power, of grief. Between them, the little Jap, even as she passes across the narrow field of her picture, appeals with child-like eyes and half-quivering lip for your patience while she hastens on your errand. It is quite worth noting that Mr. Pepper, with no attempt to tell a story—for these three pictures are but figure and bare background, nothing else—succeeds in thus drawing attention to the mental traits of his subject.

These three artists, of whom Mr. Hopkinson shows the broadest range, Mr. Prendergast the most uncompromising methods, Mr. Pepper the most persuasive appeal, have, by different ways, reached different points of view. All the more interesting is it, then, to see their works together, and to find that each of the fourteen paintings leaves its distinct impression. This is not because of their small number; I write at a two days' interval after viewing the collection, and without a note taken at the time, which gives plenty of chance to forget the insignificant. If, then, each is worth remembering, perhaps indeed "every single one of them is right."

ALLEN FRENCH.

Concord, Mass., March 19.

FIRST RAISING OF THE STARS AND STRIPES.

TO THE EDITOR OF THE NATION:

SIR: I note with considerable interest the letter in your issue of March 9, entitled the "First Raising of the Stars and Stripes," and signed "American." This is a subject in which the writer has taken a good deal of interest and which he has studied for a long time. There are very few facts regarding the early history of the flag that can be proved. One statement made by "American" is incorrect—that the flag was carried for the first time in the battle of Brandywine. It is generally accepted that the skirmish at Cooch's Bridge in Delaware on September 3, 1777, was the first engagement in which the American flag was used after it had been publicly proclaimed as the national flag. To mark this site a monument was there unveiled with appropriate ceremonies, September 3, 1901.

But unquestionably the Stars and Stripes were in use in the army long before Congress officially adopted them. A portrait of Gen. Washington after the Battle of Trenton, December, 1776, by Capt. Charles Willson Peale, the commander of a company in this battle, which is supposed to have been painted immediately after the battle and which was, until recently, on exhibition in the Senate Wing of the National Capitol, shows a flag with a blue field and white stars arranged in a circle. Another portrait of Washington Before the Battle of Princeton, by John Trumbull an aide-de-camp to Washington, shows the American flag with thirteen stars. This would prove that the Stars and Stripes were really used by Gen. Washington before they were officially adopted.

Now, we know that Washington was encamped at Middlebrook Heights near Bound Brook the month of June, 1777, and that Congress officially adopted the National flag on June 14, 1777, the exact wording taken from a fac-simile of the Journal of the Continental Congress, reading:

Resolved: That the flag of the United States be 13 stripes alternate red and white, that the Union be 13 stars white in a blue field representing a new constellation.

This being an order affecting the Military Department, it would, according to all military regulations, be at once transmitted to army headquarters, which we all know were at that time at Camp Middlebrook. Allowing time for the courier to reach headquarters, "American" seems correct in his statement that the Stars and Stripes were raised not more than two days after June 14, 1777, the route from Philadelphia being open as history records. The flag was already in possession of the army headquarters as has been shown.

There is a very interesting book about the flag, entitled "The Evolution of the American Flag," compiled by George Canby, a grandson of Betsy Ross, and published in Philadelphia in 1909.

RUSSELL E. WATSON.

New Brunswick, N. J., March 13.

TO THE EDITOR OF THE NATION:

SIR: The date of the first raising of the Stars and Stripes, a matter referred to by "American" in your issue of March 9, is hard to settle with certainty. The first distinctive continental flag was raised over Washington's headquarters in Cambridge on January 1, 1776; but, of course, this was not the Stars and Stripes, for the colonies had not as yet decided that separation from England was necessary and unavoidable. This standard introduced the stripes of the present flag, but retained the crosses of St. George and St. Andrew on a blue ground in the corner, the whole implying the surviving acknowledgment of the royal power, with the appearance of a new nation. When independence had eliminated the royal element, the crosses were replaced (1777) by stars as at present. This national flag—thirteen stripes, red and white, and thirteen stars on a blue field—was adopted by the Continental Congress on June 14, 1777; but, for some reason, the adoption seems not to have been officially promulgated until September 3, 1777. (See Harper's Encyclopedia of United States History, Vol. III, p. 383.) It seems hardly probable, therefore, that this national flag was officially raised over the army headquarters before that date. This supposition, inherently probable, is confirmed by the statement of the late John Fiske in his "History of the United States," p. 227. Describing the march of St. Leger down the Mohawk Valley and his siege of Fort Stanwix, he says:

That same day (August 6, 1777), the garrison at Fort Stanwix made a sortie and sacked a part of St. Leger's camp, capturing five British flags. They hoisted these flags upside down over their fort and raised above them a rude flag made of scraps of a blue jacket and a white shirt, with some bits of red flannel. Congress had in June adopted the national banner of stars and stripes, and this was the first time it was ever hoisted.

W. H. WHITING, JR.

Hampden-Sidney, Va., March 14.

THE EXCHANGE OF PROFESSORS WITH GERMANY.

TO THE EDITOR OF THE NATION:

SIR: Will you permit me to express my concurrence with your view of the purposes and methods appropriate to the exchange of professors with Germany, and to say that it accurately represents the plan as originally proposed? A strictly academic interchange of instruction, an acceptance of the visitor on both sides as a member of the teaching staff with no exceptional place or mission, a belief that each university had something to teach which the other might wish to learn—this, and nothing more, was the scheme welcomed by Harvard University in 1905, and the consistent maintenance of this view is essential, if we are either to get competent scholars to go to Germany or to command the confidence of scholars there.

On one point, however, I venture to take a more rigid view of the case than your editorial suggests. You remark that "the establishment of the exchange was primarily a peace measure; they were to be the unofficial ambassadors, who, free from the trammels of diplomacy, could smooth out misunderstandings." That seems to me a dangerous extension of the visiting professor's functions, and precisely the peril which the exchange has encountered. To fancy one's self an "unofficial ambassador" is almost inevitably to become involved in affairs of the court and the chancelleries, with which one's mission has nothing to do. A German professor does not come here as an "ambassador." He comes to lecture on Greek or music, and if international peace is promoted, it will be simply by his knowing us better and believing in us more. The same limitation of function should be observed in Germany. You justly commend the services of Professor Richards and Professor Davis. They were, however, not

"smoothing out misunderstandings," but lecturing on chemistry and geography; and the opportunities which they had of meeting distinguished personages were as incidental to their work as an evening at the opera. Academic interchanges may be no slight contribution to the peace of nations, but this must occur, not by conscious intention, but by strengthening the bonds of scholarship and by teaching the unity of truth. Harvard University has committed itself to the promotion of this strictly academic aim; and the Prussian Ministry of Instruction — where, under the arrangement with Harvard University, the choice of visiting professor is annually made from a submitted list—has again expressed its agreement with this view by selecting as its guest for 1911-12 Theobald Smith, professor of comparative pathology. FRANCIS G. PEABODY.

Cambridge, Mass., April 6.

TO THE EDITOR OF THE NATION:

SIR: While fully sympathizing with the sentiments expressed in your article on "The Exchange of Professors" (*Nation*, March 30), I should like to draw your attention to two or three points. First, one of "the two American professors who have been in Berlin this winter" is a German, born and bred; secondly, the Harvard exchange professor is selected not by the "Harvard authorities"—though doubtless in consultation with them—but by a high official, presumably the Minister of Public Instruction, in Berlin; third, the notion of a college "forbidding" its professors to conduct their social lives as may seem to them good appears, in Cambridge at least, a little comic.

> The right to be a cussèd fool
> Is safe from all devices human;
> It's common, as a general rule,
> To every man that's born of woman.

L. W. HOPKINSON.

Cambridge, Mass., April 2.

FROM CAUSE TO EFFECT.

TO THE EDITOR OF THE NATION:

SIR: Your editorial in a recent number, entitled "The Human Factor in Medicine," is more a criticism on Bernard Shaw than a disposal of the assertion that the present tendency in medicine is to kill us with "serum cultures" and hypodermic injections. Within the past few days I have heard two men of average intelligence regret that the Flexner serum had been used in the case of the doctor who recently died. Thirty years ago there were no "Rockefeller Institutes." Brown Sequard was criticised as a dangerous enthusiast because of his "reckless" use of subtle vegetable poisons. Yet his remedies were administered through the stomach, where their virulence was immediately modified by chemical action. Now it is well known that these same poisons, when administered subcutaneously, in infinitesimal quantities, have sometimes produced alarming symptoms and even death; while in other instances many times the quantity has produced no dangerous effect. It must be admitted that the difference was in the patient and not in the drug. Dr. Snow may be too severe and Bernard Shaw too sarcastic, but this is a question that is agitating the public mind perhaps more than is generally suspected. Various serums differ in their mode of preparation, but all depend for their so-called curative properties upon the poison that is in them. No doctor in New York would risk injecting 1-100 grain of atropine into his own system, for while he might do it in perfect safety he knows that no two systems are alike, and he knows that no chemical combination is absolutely a success. The ordinary medical practitioner's knowledge of chemistry does not seem to be large, but he knows that prussic acid does not kill every dog, even in big doses. If doctors were all well balanced and cautious men, the danger would be less, but their professional attitude is largely influenced by their temperament; and I think it will readily be conceded that the medical fraternity has not gained anything by its appearance in court, as "expert evidence." If pain and increased temperature are but symptoms, why should the doctor seek to destroy them before they have developed into any recognized type of disease? J. E. DUBOIS.

Ogdensburg, N. Y., April 2.

"PRACTICALLY."

TO THE EDITOR OF THE NATION:

SIR: I am glad to see in my last *Nation* (February 9) the letter of Professor McKnight on "Commercial English," and that of Professor Hall on "'Pessimistic' and 'Optimistic.'" I have long desired to see such a treatment of *practical* and *practically* as Fitzedward Hall would have given them, if he had happened to notice the impropriety with which those words are used, perhaps by all writers!

I am led to such notice of it as I can give, in the absence of books and notes, by an unusually strained use of the poor word in a leading article in the same issue of the *Nation*, p. 135, col. 2, line 38: "What practically happens . . . is," etc.

The usual misuse of the word is for *nearly* or *almost*. I think the dictionaries recognize it as a use, with no hint of its impropriety. The Standard Dictionary recognizes *enthuse*, with no hint, if I remember aright, of its vulgarity (possibly "colloquial"). This perhaps raises the question: What is the function of a dictionary as to words that creep into the language from infected sources? Ought it to welcome all new-comers alike, or draw a line between those invited by need and intruders? *Proposition* is not needed for anything but *something proposed*, and *practically* is not needed for *not quite*. Is a dictionary not out of its function as much in recognizing vulgar words as valid as in the other extreme of not recognizing bad usage at all? Or what usage is it that makes words? The usage of business makes business words of course; but can the usage of every writer under the sun make *practically* a good word for *almost*, or *proposition* for *man* or *circumstance* or *enterprise* or *thing*?

JOHN E. POWERS.

Palermo, Sicily, March 1.

[The *Nation* agrees with Mr. Powers in regard to the common misuse of *practically* for *virtually*. As a matter of fact, the word in this particular instance was used correctly as meaning *in practice*. ED. THE NATION.]

Military Japan. The Japanese Army and Navy in 1910. By J. C. Balet. Translated from the French by C. A. Parry, B.A. Yokohama: Kelly & Walsh

The Japanese Empire and its Economic Conditions. By Joseph d'Autremer, Lecturer at the School of Oriental Languages, Paris. Translated from the French. With a map and 20 illustrations. New York: Chas. Scribner's Sons. $3 net.

The Political Development of Japan, 1867-1909. By George Etsujiro Uyehara, B.A. (Wash.), D.Sc. (Lond.). New York: E. P. Dutton & Co. $3 net.

The first three of these half-dozen books on Japan recall the kind of criticism and appreciation we used to get a score of years ago, when the globe-trotter discovered the country. But there is a difference: the traveller needs to be more carefully equipped now than then if he hopes for readers. Yet even with his increased accuracy it is doubtful if he conveys a truer idea of the real Japan than he did before she had acquired a navy. There remains ever the intangible something that separates the Oriental and the Occidental. It effectually obscures even the simplest statement; it misleads the best intentioned critic whose sympathy and long experience with the people of another world are incontinently betrayed by alien standards. A type of this sort is the author of "Behind the Screens." She has a shrewd wit and some knowledge of the language. She is cheerful and generally charitable in her observations upon a people who are passing through the awkward age of a nation in transition. She gives us a clever and decidedly readable book. It is doubtful, however, if much is gained on either side by printing the "wholesome truths" she has to tell, or by pressing the analogy of the individual and the nation; there are resemblances between the two, but they count for little as a basis of political estimate or reform—and the political relationships of Japan bulk rather large in her pages. A grewsome tale is told of a poor old couple procuring from the

War Office the release of an only son from military service during the late war. After being summoned one morning to the Office to get his papers the boy's body was delivered at nightfall at his father's door with the laconic message, "He will remain at home now." Stories of this sort are floating about every club and hotel piazza in the East. They are sometimes founded on fact, but they are almost always untrue. Does it serve any decent or honorable purpose to repeat them in print?

Lady Lawson's "Highways and Homes of Japan" is a duller recital, but more instructive and better worth a place on a library shelf. She has filled her notebooks with items small and great gathered upon two visits to the Empire and digested with considerable care. There is little criticism and abundant sympathy shown in her minute examination of the social structure, but we are never for a moment relieved from the standards of good old England. "What a contrast," she exclaims, after seeing "one fat and flabby wrestler pushed out of the ring by another even fatter and more flabby"—"what a contrast to European professionals, who are trained down until nothing is left but bone and muscle!" One recalls the contrast observed by another Englishwoman at the theatre between the domestic life of Cleopatra's court and "that of our own gracious sovereign."

A. M. Thompson is an editor and dramatic critic who is not ashamed to say that he went to "Japan for a Week" to get local color for setting a new play in London, and thought an account of his trip worth putting into his paper. The letters thus engendered were obviously written for an uncritical group of readers. He is willing to say what he thinks, and to say it frankly. He did not like the geishas, or the inns, or the cooking, or the smells; he "came to seek the capital of fairyland and discovered an Oriental Manchester." Of course, if Mr. Thompson did not like a thing it was not good.

"Military Japan" is something more than the soldier's handbook which the title implies; it is the initial portion of a larger work by a French officer long resident in the country, the remainder of which will be devoted to the economic resources and social life of the Empire. The information compressed in this little volume is more complete than any to be found elsewhere in a European language, and on this account it will be invaluable for reference to the student of Japanese policy. Among many penetrating observations of the author two are worth noting: despite an appearance of perfect solidarity in the governmental machine, the two feudal clans of Choshu and Satsuma which led the revolt against the Tokugawa in 1867 still maintain a selfish and exclusive control over the army and navy. In the antipathy shown by these clans toward each other and toward the rest of the provinces, the author sees a menace of future strife which may in time repeat the mediæval struggle between Taira and Minamoto; "for it must not be supposed," he adds, "that this absolute preponderance of the two clans is accepted joyfully and without jealousy by the rest of Japan. Attacks, though as yet timid ones, have been delivered in Parliament, in the press, and in public meetings at this relic of feudalism, *bambatsu seifu*." M. Balet's second observation relates to the Japanese common soldier. He praises him for his implicit obedience and devotion to the politico-mystical faith in the imperial divinity, qualites that have been "cleverly kept up and skilfully worked" by the authorities to accomplish great things in a short time; but the Japanese individual he describes as lacking in frankness and decision. "The man is formal, arrogant, addicted to excesses, rancorous, and vindictive. On the other hand, he loves reason and has a profound sense of justice." This estimate by a considerate interpreter of Japan as she is to-day is suggestive, in view of his conviction that "the Japanese army, young, enthusiastic, and never having known defeat, is certainly preparing itself for new victories."

M. d'Autremer's "Japanese Empire and its Economic Conditions" is a sober volume which has served a useful purpose as a work of reference for French students of Japan. It hardly seems worth putting into English when account is taken of the numerous books of this sort already in our language. The volume is amply furnished with statistics on the products, trade, and industrial development of the country. It is only possible here to pass these by with a nervous twinge of gratitude that we do not have to stop and verify the figures, but confidence in their probable accuracy is not increased by occasional slips which the author has made in historical statements, such as giving 1852 for the date of Perry's expedition, referring to the "closing of Japanese ports to foreigners *down to* 1617," and to Kyoto as the first permanent capital of the Empire. The book has the same inadequate map that appears in the volume on Japan in the Story of the Nations series.

Dr. Uyehara's "Political Development of Japan," submitted as a doctor's thesis to the University of London, is the most careful and comprehensive study that has yet appeared on the introduction of representative institutions into Japan. Though it is now twenty years since Nitobe began the series of historical and economic studies on Japan issued by successive Japanese students trained in foreign universities, this essay may still be counted as among the first fruits of that intellectual harvest from which much is yet to be expected in these profitable fields of research. The author of this volume is not quite so happy in his preliminary discussion of "the nation and its political mind" as in presenting the political situation as it is at present. He need not be blamed for being less of a philosopher than an historian, but a reviewer has a right to inquire why he declares that "a retrospect of many centuries furnishes no trace of civil wars or of struggles which might have threatened the unity and solidarity of the nation." The feudal period of Japanese history strikes the Western observer as having been singularly contentious as compared with other states of the same degree of culture.

The genesis of the constitutional movement in Japan is generally dated from the promulgation of the "Charter Oath" of April 6, 1868, at the beginning of the present Emperor's reign. Dr. Uyehara makes it plain that this oath was inspired by the determination of a few leading statesmen of the period to undertake a national reorganization for preserving the independence of the country and freeing it from foreign aggression—not, as has been alleged, to checkmate the Western *daimyos* in their attempt to obtain supreme power. A comparison of this crisis with the barons' uprising against King John of England is inappropriate, therefore, because in Japan the impulse toward change came from above, not from the people. And this has been the process from the inception of Japan's political reconstruction, where liberty is *bestowed* and the political struggle, such as it is, remains a clash of feudal clans. The peace of the country has been preserved by a supreme and divinely established throne, always able to silence agitators by sheer weight of prestige, but not in any real sense responsible to the people. This feature of the Japanese governmental system is scarcely understood abroad. It is a mask of representative institutions, not responsible government as accepted in the West. Here is where Japan still halts on her way from pure autocracy to a genuine parliamentary régime:

> According to the traditional political ideas of the Japanese, the chief duty of the ministers of state was to keep the country for the Emperor and to promote the happiness and prosperity of his subjects. To fail in this duty and to allow the Emperor to be cognizant of the dissatisfaction and suffering of his beloved subjects was considered disloyal on the part of the ministers and deserving of *hara kiri*. It was, and still is, imagined by the masses that the wish of the Emperor to make his subjects happy and contented is akin to that of a kind father toward his children.

The matter is one of great interest to students of government because Japan is the first country outside Christendom to assume the machinery of European

administrations. The machinery once set up, it remains to be seen whether an Oriental people can work it. At present it should seem that Japan was far from comprehending the true idea of constitutionalism. The "oligarchic statesmen" in power adopt the methods of Walpole and of Tammany to procure their ends; the voters take bribes. This, the author declares, is not because they have not enjoyed the franchise long enough to understand its use. Corruption, instead of decreasing, has steadily increased under the constitutional régime, and has not been checked by the passage of a Corrupt Practices Act in 1901. With this also is found the unwholesome symptom of abstention, the increase in the proportion of voters who stay away from the polls having risen from 11.72 per cent. in 1898 to 28.56 per cent. in 1908. A tendency is noted toward the development of professional politicians, rings, and bosses, and with these has come the inevitable increase in the expense of standing for election, so that it now costs a successful candidate about 3,000 yen—a heavy burden when the wealth of the country is considered. "Yet the seat for which they pay so dearly yields them very little power; some members of the House never take part in a debate during the whole of their parliamentary life, but simply sit and vote as directed by the whips of their party. The worst part of the bargain, however, is the uncertain length of their parliamentary existence. It is limited to four years, but at any time the House may be dissolved at the fiat of the bureaucratic statesmen in power."

But the fault need not be supposed to lie in a lack of intelligence on the part of the voter or in a low state of public morality; in both of these respects Japan is probably as well off as America. It remains for her to finish her task and remove the remaining traces of feudalism and autocracy by making the government really responsible to the will of the people.

CURRENT FICTION.

The Broad Highway. By Jeffery Farnol. Boston: Little, Brown & Co.

The American publishers of this tale have trumpeted it as a masterpiece by a new author; and the English press notices furnished from the same source show that the book has been favorably, if not judicially, received in London. One critic declares that it is "more fascinating and even more human than 'Lorna Doone,'" a second rates the story-teller with Dumas, a third thinks him like Dickens, and a fourth (that well-known critical authority, the *Sportsman*) traces his derivation to "Fielding or Sir Conan Doyle," Addison, and Steele. All of which would indicate that the exuberant pressman is not an exclusively American genius. The *Sportsman* further declares this novel to be "a work of art by an unconscious artist." Nothing more patently untrue could be said of this book. Its "ante scriptum" quite frankly confesses a self-conscious origin. And Mr. Farnol's real model seems to have escaped the ken of the above-cited commentators. There is a romantic story, and a sufficiently wild one, but where the book most distinctly has merit it owes most to George Borrow. The simpler adventures of the road, the colloquies with tinkers, coachmen, and the like, the Scriptural tang of narrative and dialogue, all owe their favor and inspiration to Lavengro. As for the more conventionally romantic part of the book, the quality of the incident oddly antedates the setting. That is, the action takes place in nineteenth-century England, but the atmosphere is that of the 'sblood period, the day of smallsword and periwig. Peter Vibart, the hero, is a man of good blood and education, suddenly thrown upon his own resources by the eccentric will of an uncle. A clause of the will gives him the nominal chance of winning a fortune by marrying a certain town beauty and toast. The chance is also open to a wild cousin, Peter's double in appearance, and antithesis in character. Peter takes to the road, becomes a blacksmith, and, of course, in due time, brings the wild cousin to confusion and carries off the lady and the fortune. The plot is developed ingeniously enough, and the incidents are not more improbable than ordinary in the popular romance. But the charm of the book lies in its Borrovian touches.

The Prodigal Judge. By Vaughan Kester. Indianapolis: The Bobbs-Merrill Co.

Such a string of adventures as that which forms this story ought, if rightly handled, to hold the reader's interest securely. Back in the days of Andrew Jackson, we read, a small boy of uncertain origin, Hannibal Wayne Hazard, is left by the death of his protector, a mum old general, living on a huge estate in North Carolina, to the care of the mountaineer, Bob Yancey. Enters at once Capt. Murrell, the villain, sues in vain for the hand of Betty Malroy, an heiress from Memphis, and then tries to possess himself of Hannibal, who is evidently the key to some mystery. There follow: An attempt at kidnapping; a country law trial; flight by Hannibal and Yancey, with Murrell in pursuit; a drunken encounter at an inn where Yancey is all but killed; Hannibal's escape from Murrell to the company of the two middle-aged, bibulous pals, the judge and Solomon; the judge's imprisonment and jail-breaking; the migration of the three to Memphis; the arrival of Murrell, and the kidnapping of Hannibal and Betty; the rescue by lovers; the solving of the mystery by the judge regenerate; the seizing of the fortune.

Here is stuff for a "Treasure Island," for a capital detective story, for a "Candide," for an "Ivanhoe," to go no farther. Our quarrel with "The Prodigal Judge" is that its author has given us something like all of these combined; he has not seen that to animate such a mass of incident, it is necessary to choose and stick to some one fictional type. The story has no informing emphasis, and is hence without literary meaning. It is kept from being a closely-reasoned mystery story by several loose ends in the plot—why, for instance, after the boy has testified to Murrell's murderous assault upon Yancey, is nothing done about it? So, too, the author has not the audacity for pure adventure, being too much concerned with prosy preparation. He has no talent for sketching historical background of the sort which gives reasonableness to highly wrought action. And as for his satire or character-drawing, excepting a few good touches (which are inevitable in a work of such length), it does not rise above his chief creation, the judge, who is picturesque, solely because of a superficial resemblance to Falstaff, being an adult "sport," with a bald head and with a notable full-length profile.

Fortunata. By Marjorie Patterson. New York: Harper & Bros.

After reading this book and upon thinking it over in cold blood—a temperature not hindered by the reading—one reflects, "What a delightful novel the author might write! What a hopelessly, sordidly worldly one she has written!" Bitter, cynical, vicious, one may not call it, even though its scenes are all these, for they are given as by a note-taker and not a sympathizer. Untidy it seldom is. Amusing at points it may be found; conspicuously clever in its tool-work it is beyond a doubt. A touch, an epithet, a gesture, and a portrait is made manifest. A word, a line, and the Italian scene or the English hearth stands forth in high relief. The enjoyment of mere cleverness finds here its satisfaction. Enjoyment of any other sort turns away baffled. The story treats of an Italian, American-tinctured family and its struggle for life. Life in the case of Fortunata is interpreted to mean an advantageous marriage. With her half-sister Antonia it is a combination of religion and of an open *liaison* with her husband's brother. The American invalid mother of Fortunata asks only to take her medicines in peace. The Englishman seeks a healthy wife and a gentleman's career; the Italian men their drink, their pleasures, and their quarrels. The horrible old princess aunt, who dominates them all, finds her life

in bullying the family circle, in practising trickery, with less finesse than we should have expected, and in equipping her favorite Fortunata with every weapon that unscrupulous worldliness can devise. Fortunata, apt pupil, is helped by having only a rudimentary heart. Her early tribulations seldom reach a deeper depth than ennui and pecuniary embarrassment. She fights valiantly to reach social heights, discarding many a lover, each one for the sake of one on a higher step. At handsome, inarticulate, rich, English Lord Trevers she pauses, long enough to marry him, and still plots on, her aim now dizzy diplomatic heights for her husband. The publishers call Fortunata an Italian Becky Sharp. She does indeed belong among the professional self-seekers of fiction, and the book among the portrait galleries of all sorts and conditions of degradation. But it is calculated to make one do a tardy justice to Dobbin, and positively sigh for Amelia.

A Captain of Raleigh's. By G. E. Theodore Roberts. Boston: L. C. Page & Co.

Mr. Roberts's story lacks neither incident nor action, and certainly a beautiful girl taking passage, under the name and guise of her twin brother, on board a sailing vessel bound for Newfoundland in the stormy days that immediately succeeded Sir Walter Raleigh's execution, makes a situation dear and familiar to true lovers of romance. There is fighting, too, kidnapping, hair-breadth escapes, duels in which the ugly and insignificant gentleman-adventurer proves himself a marvellous swordsman and a generous victor; a hero, half pirate, half gallant soldier, and sailor; and there is also, of course, the sort of love story which is part and parcel of romance. The Devon fishermen have been less used than most colonial material, and the book is smoothly enough written, but Mr. Roberts kills his effects by describing them, and the only real people are the gentleman-adventurer and an old ship-master. In a word, the spirit of romance that can kindle into life hackneyed situations and well-worn types is lacking and nothing is given us in its place.

Angela's Quest. By Lilian Bell. New York: Duffield & Co.

The trembling fugitive from convent thralldom hastily pulled down her imperfectly adjusted wig, and the unsuspecting Pinkerton detective, who was on the outlook for her wealth of red-gold tresses, "passed from the car." Then the friendly young reporter sitting next, who had given her the tip, summed up the literary value of the situation. "I feel," said he, "that Laura Jean Libby ought to hear of this." Beyond this two-edged comment there is nothing in this piece of melodrama to suggest the seasoned observer and quiet recorder of "The Love Affairs of an Old Maid."

The nature of Angela's quest and the degree of its success may be inferred from the final scene. It takes place on the "shining deck" of a private yacht off the coast of Central America, while in a small boat below, half-drowned and both ankles broken, lies the villain who has "cheated the hangman for thirty years":

> The spent and broken wreck of her husband, white-haired, unkempt, and clad in filthy rags, tottered across the deck. . . . [He had been "railroaded to a madhouse" thirteen years before to a day.] With a low cry Mrs. Cravanath held out her hands . . . and gathering him into her arms . . . spoke aloud . . . [She had been totally paralyzed for ten years.] At this, Angela, who had not been told of her father's identity, ran forward and flung herself on her knees by the side of her reunited parents, her long ropes of auburn hair sweeping the deck, as she gazed rapturously into their glorified faces.

When Half-Gods Go. By Helen Reimensnyder Martin. New York: The Century Co.

The highly improbable in fiction calls loudly for the highly plausible. This has hardly been attained by Mrs. Martin in her study of the artistic temperament. The story in its main lines is not incredible. The blameless divisibility of artists' affections, the pained compliance of clear-eyed wives, the high intent of beautiful, meddlesome souls, the deceitful wiles of chivalry are fair game for the fiction-hunter. It is the performance, not the plan, that in spite of a natural manner, has brought the story close to caricature. The bride of a music professor confides to a woman friend in a series of letters the story of her days. She and her husband begin by being ideally happy. They work together in a conservatory of music and live with his colorless mother and highly-tinted brother, a man of Rochester-like manners which conceal the usual brain and heart. To this family group enters Dorothea, of musical genius and soulful philosophies, who embraces the double task of teaching at the conservatory and of uplifting Edith and Robert to her own high plane of thinking. And here is the place where plausibility begins to flutter its wings—pauses long enough to see Dorothea, still in the missionary attitude, help herself to an undue share of Robert; hears Edith call Dorothea "magnetic, gifted, womanly, lovable, and good"; hears her declare that she should have a poor opinion of Robert if he didn't fairly worship her—but does not take actual flight till chased away by the sheer tiresomeness of Dorothea. It is not feasible to fancy any one, least of all an airy charmer like Robert, with a soul scornfully above the obvious, sitting spellbound by her platitudes. Brother Eliot presently takes a hand, arranging in his clear-sighted way to save his brother and sister-in-law by diverting to himself Dorothea's affections; the which having obtained in embarrassing degree, since he did not in the least want them, he hands back to Dorothea in the presence of the others. Dorothea makes an exit from the room "in one swift movement," calling herself correctly but inadequately "a selfish fool." Robert retires to a sanatorium and to an opportune death. Edith endures a few months of disquietude, after which occurs the arrival of the god in the person of Eliot. It now appears that she was the only woman to whom he had ever given a thought. The reader, in spite of Eliot's early manner, has suspected him from the first; ever since the moment when he had said to Edith at the piano, "Your playing so absolutely expresses the feminine that it's almost weirdly alluring to the male, my dear!"

RELIGIOUS PRAGMATISM.

The Alchemy of Thought. By L. P. Jacks. New York: Henry Holt & Co. $3 net.

Professor Jacks is best known in this country as the editor of the *Hibbert Journal* and the possessor of a sprightly pen. He is also dean of Manchester College, Oxford, and, in the world of philosophy, one of the leaders in the attack upon the "conceptualistic logic." Though not himself technically a pragmatist, he shares the pragmatic spirit. The book is a collection of fifteen essays, written at different times and on different subjects, and hence is somewhat lacking in unity and even in consistency. This, however, is less unfortunate than the fact that to a considerable (and sometimes to a wearisome) extent the essays overlap and repeat in several forms what had already been made sufficiently clear. If the book had been written as a whole and from a single point of view it would probably have been only a third as long—and fully twice as readable.

What unity the various essays have they get from their common attack upon conceptualism. This attack starts with a consideration of the philosophical attitude, which, we are repeatedly reminded, is not the only one. The universe *may* be regarded as a problem to be solved; but it is absurd, in fact it is impossible, for us to regard it only thus. Yet the insistence of philosophy upon this view has made most of us forget the other possible and actual ways of regarding the universe, and has resulted in much harmful skepticism and other unnecessary evils. One of the greatest of these evils is to be found in the usurpations of language. We con-

stantly forget that language is not the only form of expression and that there are many things which by its nature it cannot express. Hence "we have confused the unsayable-by-us with the inexplicable-in-itself, and drawn the Agnostic's conclusion that things about which *we* can say nothing, can say nothing about themselves":

It is only after prolonged and often painful self-examination that any of us can realize the extent to which our minds are in bondage to words, to phrases, to formulæ. We are children of an age which spends the best energies of its life in an atmosphere of deferred fulfilment, continually postponing the act of living to the work of mentally preparing to live.

To this confidence in the power of language are also due many of the failures of philosophy. For, in the opinion of our author, the static can never express the dynamic; and the deeper problems of a dynamic and changing world and of a developing and willing mind can never be solved or even expressed by means of words and concepts, which are essentially static. Hence the real aim of philosophy is not to photograph and reproduce the universe—why should it care to do that even if it could?—but rather to enlarge and enrich it. This it can do in part by freeing us from the usurpations of language; and beyond that by enforcing the attitude of meditation:

Reflective thought ends in the discovery that we do not explain any object until, like the poet, we "fade away" with it into the silent forest, far from the strife of tongues. Thus philosophy ends in the wonder with which it began—a state of mind which prefers to attend rather than to speak.

This attack upon abstractions culminates in the somewhat grotesque essay entitled "Devil's Island"—a symbolic interpretation of the abstract method in philosophy. The essay is not always as clever as it means to be, but its description of the "Omniscients" (or conceptualistic monists who know "the ALL as such") will probably be long remembered by every reader of the book. In a conversation with one of these Omniscients, the author, who has spent some years on Devil's Island, happens to refer to a small flower, a snapdragon, whereupon the Omniscient exclaims:

"Snapdragon? What fool is talking of snapdragons? There are no snapdragons here."

"But what's that you're looking at?" I cried, pointing to the flower in the crannied wall.

"God-and-man," he groaned; "God-and-man! Will the awful thing never depart?"

He turned his eyes upon me and the utter vacancy of their look made me shudder. Then in a flash the secret of his trouble was revealed to me. "He's at the universal standpoint," I thought, "and sees nothing. It's the blindness of omniscience. The Oneness of the One has got hold of him."

"The Alchemy of Thought," from which the book takes its name, is the title of one of the essays, and it expresses what, next to the insufficiency of conceptualism, is the main thesis of the book. This thesis is stated as follows:

To interpret experience is to change it. . . . To suppose that any physical or psychical object remains passive under our effort to understand it, and is the same when understood that it was before, is as though one were to say that the bacon which a man eats for his breakfast is still bacon when it has been digested and used up in the nourishment of his brain. An interpretation is a kind of alchemy which, when applied to any object, transforms its character as a thing to be understood. . . . A fact to be understood bears the same relation to the fact not understood, both as to its sameness and difference, as the man bears to the boy.

Numerous illustrations of this peculiar form of transformation are given both in this essay and in the one entitled "Self-defeating Theories." Thus, "assuming Mill's explanation of the love of virtue to be true, my only chance of retaining that love is to remain in total ignorance of the explanation." Likewise, if prediction in human affairs is possible, the prediction must not be made, for knowledge of it might very well defeat its fulfilment. But this peculiar result of thinking is especially important in connection with the larger theories of metaphysics. For every attempt to express the nature of the universe makes the universe different, and hence no expression of it can ever be taken as final. This is no less true of pragmatism than of all its predecessors. No philosophy, not even the most fluent and "dynamic," can ever quite keep pace with the universe, which necessarily is always at least one step ahead of the philosopher.

Each new philosophy adds something to the universe, and is at the same time the product and expression of the universe which it expresses. In this sense the universe is the great philosopher, and the various philosophies are the self-revelations of the one reality. Nor should the contradictions between opposing systems be considered inconsistent with this view, for all these diverse philosophies are needed, if the richness of reality is to get expressed. In short, Professor Jacks is so thorough-going a pluralist that he has room even for monism as one of the many real aspects of his many-faced universe. *No* philosophy—not even pragmatism or pluralism—expresses all the truth.

In the narrower field of human nature, no less than in the broader metaphysical sphere, the principle of the Alchemy of Thought finds important applications. There can be no "Science of Man"—no really scientific psychology, anthropology, or ethics—both because man is essentially a living and willing being, while the terms of science must be static and fixed; and also because the very knowledge of such a scientific truth concerning him if once known by him would enable him to thwart it, and thus make the so-called "truth" no longer true. This fact, in our author's opinion, makes the modern attempts to "manipulate man"—the "moral education" of children, the management of "lower races," the attempted interference with Nature called "Eugenics"—as irrational as it is wicked:

That Man is an instrument to be employed by Man; that he is a thing to be made use of, exploited, turned to account, reformed, developed, compelled to serve a purpose, by beings who call themselves "we"; that "we" can raise him as though he were a bullock; that "we" can improve him as though he were a cart-horse; that "we" can breed him on Mendelian or other principles as though he were a Cochin-China fowl; that "we" can dictate his habits as though he were a hedge to be trimmed or a torrent to be confined—this, we repeat, is our deep-seated illusion.

Doubtless Prof. Jacks is right in saying that the manipulation of man has often been carried much too far. Yet something might still be said for the rational guidance of the race by the race. Reason is not altogether inferior to instinct and impulse, and we are to some extent our brothers' keepers. Nor is it altogether certain that even the conceptualistic logic is as black as it is sometimes painted. It may, in fact, be questioned whether Professor Jacks—or Bergson or James, for that matter—sufficiently distinguishes between a proper and an improper use of the concept. When properly employed, even by an "intellectualist," it need not oust reality nor pretend to "copy" it. One should regard it as merely an abstract, but useful shorthand expression. It simply stands for and points to reality, its only apology being its function. Why it cannot point to a "dynamic" as well as to a "static" reality has never been made sufficiently clear. To be sure, it is not the reality it points to, but it should hardly be condemned for not being what it never set out to be. Taken in a rational sense, it is a tool only, but an absolutely indispensable tool. So essential is it, in fact, that all its critics perforce have to make constant use of it. Professor Jacks is among the number. Hence one feels like asking him: If no statement in words can be strictly true of a "dynamic" universe, is *this* statement true? And it may strike the reader as somewhat anomalous that one should write a book of 350 pages on philosophy to prove that true philosophy is silent. In like manner, one feels a little uncertain how to take the author's philosophical position that no philosophical position is so true as to exclude its contradictory. Is this true of the author's position, as well as of the others?

If so—and here one becomes a trifle bewildered. At any rate, it begins to look as though Professor Jacks might have added one more notable example to his list of "Self-defeating Theories." The truth seems to be that the "conceptualistic logic" is a dangerous thing, considering how very dead it is, and that one should reckon with it before writing a book on philosophy.

A Soldier's Recollections. Leaves from the diary of a Young Confederate. By Randolph H. McKim. New York: Longmans, Green & Co. $2 net.

The venerable rector of the Church of the Epiphany in Washington, D. C., gives in this book an account of his service half a century ago in the Army of Northern Virginia. A serious-minded boy, in a beautiful home in Baltimore, his father a Union man, McKim went to the University of Virginia, already looking forward to the life of a clergyman. This, however, he postponed for nearer duties at the outbreak of the civil war. He took part in the action from Bull Run to Appomattox, at first in the ranks, then as a staff-officer in the Stonewall division, and ended as chaplain of Mumford's cavalry. He was not less in the stress of battle while an aide-de-camp than while in the ranks, and as chaplain was always on or near the firing line. The interest of the story culminates at Gettysburg, where he went as a participant with the force which, penetrating behind Culp's Hill, so nearly reached the Baltimore pike and the rear of Meade's army. He was a youth of high religious character, convinced of the justice of his cause, and sternly resolute. The record, though composed in age, is largely taken from the young man's diary and letters. What it may lack in grace and picturesqueness is amply made up by its straightforward honesty and force and by its spirit of warm humanity.

The book contains also an address given by Dr. McKim to Confederate veterans in 1904. Although we admire its general tone, especially its hearty acceptance of the result of the war, and its earnest loyalty to the now reconstituted Union, there are several points, maintained here and also in the body of the book, to which we demur. We shall not meddle with his argument for the right of secession; that would, indeed, be a threshing over of old straw. All now admit that the point in the Constitution was in doubt. Dr. McKim's statement, while plausible and good-tempered, is yet *ex parte*, not judicial; and we hope the English readers, whom, no doubt, he desires to reach, will remember that there is another side. Dr. McKim has no love for slavery, and argues that its extension into the territories would, by dissipating it, have contributed not to its spread, but to its extinction. We recall that Madison, in the time of the Louisiana purchase, foreseeing a vast emigration into the unfriendly trans-Mississippi country, feared detriment, if not destruction to the Anglo-Saxon masses from "the dilution of the population." The facts have not justified Madison's fear, nor do we think Dr. McKim's theory reasonable as to the probable effect of slavery extension. Again, our author, while asserting what no one will deny, that economic reasons and not conscientious scruples brought about the disappearance of slavery in the North, declares that economic reasons had little or nothing to do with the tenacity with which the South came to hold to it. The invention of the cotton-gin had small influence on the growth of cotton. The system of bondage was an inheritance impatiently suffered, rather than approved; and our author scouts the idea that the purpose of the South was to form a state, whose corner-stone should be slavery. He asserts that in 1832, Virginia was on the brink of abolishing slavery, and changed her mood solely because the Northern anti-slavery men, led by Garrison, showed such violence that in resentment Virginia became reactionary. Now, if these contentions are well-based, it is, indeed, an urgent matter that our history of that period should be rewritten. We have certainly been taught that economic causes worked powerfully in behalf of Southern slavery. In the far South, it was cotton raising; in Virginia, the tobacco crop and the breeding of slaves for far Southern markets were lucrative sources of revenue. Masses of the population were affected by these considerations, until slavery from being merely endured was cordially embraced. To be sure, a line of high-minded men can be traced, from Washington to R. E. Lee, whose repugnance led them to the length of manumission, but they in Southern society were not representative. So we have been taught, and such conceptions our author warmly disputes. Is he blindly partisan, or have our historians played us false?

Other contentions of Dr. McKim must be fully admitted. Slave-trading was long and shamefully rife in New England ports; during our first half-century, New England was repeatedly aflame with the spirit of secession, on grounds at bottom narrow-minded and discreditable. The sons in 1861, were, we think, wiser and more scrupulous than the fathers. We have reached better days. It is a thing to rejoice over that this able and stalwart Confederate now strongly asserts his patriotism, and is heartily loyal to an indissoluble Union. His insistence that the cause of the South was not lost, but that a vindication was achieved of the right and dignity of each constituent State within the Union, which was indispensable to the national well-being, is forcibly put, and all Americans will eagerly hope that our future course will prove this to be just.

Richard Henry Dana, jr.: Speeches in Stirring Times and Letters to a Son. Edited, with introductory sketch and notes, by Richard H. Dana, 3d. Boston: Houghton Mifflin Co. $3 net.

The speeches and papers here collected comprise, among others, Dana's speech in advocacy of an appointed judiciary, before the Massachusetts Constitutional Convention of 1853; his argument before the Massachusetts Legislature, in 1867, in favor of the repeal of the usury laws; addresses before the Free Soil meeting in Boston, in 1848, and the Free Soil convention at Buffalo in the same year; "The Great Gravitation Meeting," a parody on the Fugitive Slave Act of 1850; arguments in the fugitive slave cases of Shadrach and Burns; the "Grasp of War" speech on the reconstruction policy, delivered in Faneuil Hall in June, 1865; his great legal arguments in the Prize Cases and before the Halifax Fishery Commission; and the elaborate note on the Monroe Doctrine, originally contributed to Wheaton's "International Law." To this last paper the editor has added a continuation, bringing the account down to the present time. While these pieces, in no instance, are rare, they have not as a whole been readily available, and their republication in the present form is a welcome addition to the literature of American politics and constitutional law.

The course of Dana's public career has been so fully and well traced by Charles Francis Adams, in his two-volume biography, as to need no repetition; but Mr. Dana's introductory sketch adds a number of personal items, particularly significant as illustrations of Dana's intellectual habits, his interesting friendships, and his exacting ethical standards. We frankly think that the series of "Letters from a Father to a Son" jar somewhat with the remaining contents of the volume; but they are at least interesting in themselves, and are quite justifiably made public. The introductory notes to the several pieces are informing, and there is also a select bibliography of the most important of Dana's numerous writings.

"No doubt," says the editor at the close of his introductory sketch, "Mr Dana's life was, on the whole, a disappointment to him." One of the greatest of American jurists and publicists, he failed, to a singular degree, to reap the rewards of ability, industry, and high purpose. His partner and friend, Francis Edward Parker, well wrote of him as "buffeted . . . for more than twenty years, disappointed in every high ambition of his life, fail-

en on evil times and evil chances." It was his fate to champion, as a pioneer, unpopular causes which later, under other leaders, were to become respectable, and to oppose his party on grounds which, rejected at the time, have since come to appear sound and statesmanlike. After years of hard work at the bar, with an especially lucrative practice within his grasp, he sacrificed it to serve his State in the Legislature. His nomination as Minister to England, a post which he frankly coveted and richly deserved, was rejected by the Senate. Yet it was his service to add materially to the body of American jurisprudence, and to represent the United States with distinction in great causes; and if, with all his great powers, he found no place exactly worthy of them, it was because the times, rather than he, were out of joint. Happily for his memory, he kept himself from melancholy, though not, we think, as his son puts it, from sadness; he cherished no grievances, and continued with good humor and courage to the end.

A False Equation: The Problem of the Great Trust. By Melville M. Bigelow. Boston: Little, Brown & Co. $1.50 net.

The Great Trust is the fundamental duty imposed by the sovereign people upon the State of establishing and maintaining Equality (the capitals are Dean Bigelow's) before the law, in the general sense of providing, so far as possible, that all citizens shall have equal opportunity in the pursuits and enjoyment of life. The state, it is contended, has been remiss in keeping the trust; privilege or monopoly has become unduly established, and there has been a disintegration of the bonds of authority. In the first half of his book, which discusses the weakness of the state, Dean Bigelow gives us a jeremiad; in the last half he suggests a remedy, not, however, in terms that are wholly convincing.

On the whole, this book is not cheerful reading. It is true that the evils complained of exist. And it is true that if we were quite another people than we are their elimination would be a measurably easy task. But there's the rub. The American temperament, though Dean Bigelow does not employ that catch-phrase, is a big problem. To many minds nothing short of the means which he suggests as a remedy will seem adequate. If, he declares, there is to be "government of the people, by the people, for the people," the state must be greater than all the forces that oppose it. "It will not be enough to pass statutes and decide disputes; there must be power behind these to enforce the will of the state. There must be men competent both to direct and to execute that will." That we have not such men implies defective education. Apparently, what is needed is an organized education that shall take cognizance of the fact that the "gray layer of our brains is actually plastic and capable of being fashioned," and that shall so fashion it as to recover for us the breed of noble bloods in affairs of state. That is an end we must all desire, but we are not sure from anything Dean Bigelow tells us that it is in a fair way of being brought about. We are, we suspect, an obstinate people where our gray matter is concerned.

Notes

In the spring announcements of the Scribners are found: a new edition of "England and the English from an American Point of View," reissued with Price Collier's new book, "The West in the East from an American Point of View"; Mrs. Belloc Lowndes's "Jane Oglander," a novel of English country life: "The Revolutionary War and the Military Policy of the United States," by Gen. Francis Vinton Greene; "The Agonists: A Trilogy of God and Man," by Maurice Hewlett; R. L. Stevenson's "Lay Morals and Other Papers"; "Isabella of Milan," by Christopher Hare; "The High Roads of the Alps," by Charles L. Freeston; "Finland To-day," by George Renwick; "Florence, Past and Present," by the Rev. J. Wood Brown; "Java and Sumatra, and the Other Islands of the Dutch East Indies," by A. Cabaton, translated by Bernard Miall; "The Price," by Francis Lynde; "Mr. Wycherly's Wards," by L. Allen Harker, and "Esther Damon," by Cora Older.

To their series of Latin-American Republics, L. C. Page & Co. are adding "Argentina and Her People of Today," by Nevin O. Winter.

Frederick A. Stokes Co. announces: "Mark Twain," by Archibald Henderson; "Eastern Asia: A History," by Ian C. Hannah; "London Clubs," by Ralph Nevill, and "Alpine Flowers and Rock Gardens," by Walter P. Wright.

"The Kipling Index" has been compiled by Eugene F. Saxton and is issued gratuitously by Doubleday, Page & Co.; it may be procured by any one who sends to the publishers five cents in stamps to cover postage.

The series of animal biographies, published by George W. Jacobs Co., is to be augmented this year by Clarence Hawkes's "King of the Thundering Herd"—the story of the American bison. This house also announces "Quaker Ben," by Dr. Henry C. McCook.

Monroe Royce is publishing through Thomas Whittaker "The Passing of the American," which tries to show that the native American is being outstripped by the alien.

A second postbumous volume of O. Henry's stories, entitled "Sixes and Sevens," is promised by Doubleday, Page & Co. in the autumn.

Toward the end of April D. Appleton & Co. will put forth "The Training of Children in Religion," by the Rev. George Hodges; "The Social Direction of Human Evolution," by Prof. William E. Kellicott; "Educational Problems," by G. Stanley Hall, and "Which is My Husband?" a translation from the French of Jules Claretie, by Mary J Safford.

Messrs. Longman are bringing out "Some Problems in Philosophy: Being an Uncompleted Introduction to Philosophy," by the late William James, and "Napoleon I: a Biography," which is a translation into two volumes, by Annie Elizabeth Adams, of Prof. August Fournier's work, published in Vienna, 1905-7.

In the series of Philosophies, Ancient and Modern, Constable is issuing "Pragmatism" and "William James."

The same house has in preparation a series of illustrated Biographies, Ancient and Modern, selected to illustrate the spheres of modern literature, science, and politics. In the literary series are announced: Sainte-Beuve, Samuel Butler, Lafcadio Hearn, Tolstoy, and Lecky.

"Lollardy and the Reformation in England," from the death of Henry VIII through the reign of Edward VI, by James Gairdner, is a title in Macmillan's spring list, which also includes Owen Wister's new novel, "Members of the Family," a tale of Western life.

In "Religions and Philosophies of the East," issued this week by John Lane Company, J. M. Kennedy aims to give a concise history in a single volume.

Spring books of Sherman, French & Co. include: "The American Philosophy Pragmatism," wherein A. v. C. F. Huizinga attempts to show that Ritschlian theology is the temper which pragmatism voices; "The Volitional Element in Knowledge and Belief," by Prof. Delo C. Grover; "The Future Citizen," by F. W. Myers.

On April 15 Henry Holt & Co. bring out Miss R. Macaulay's Welsh novel, "The Valley Captives"; H. Stuart Jones's "Classical Rome," an historical guide, and Frederick Bliss Luquien's "Three Lays of Marie de France, Retold in English Verse."

The fourth and revised edition of Brehm's "Tierleben," in thirteen volumes is announced by Lemcke & Buechner. The same firm, as agent for the Columbia University Press, has in hand: "Power," by Prof. C. E. Lucke; "Business of Congress," by S. W. McCall; "Problem of World Organization as Affected by the Nature of the Modern State," by D. J. Hill; "Symbolism of Voltaire's Novels," by W. R. Price; "The Greek Romances in Elizabethan Fiction," by S. L. Wolff; "The Rise of the Novel of Manners," by Charlotte E. Morgan; "John Dennis, the Critic," by H. G. Paul; "The Political Prophecy in England," by Rupert Taylor, and "The Poems of King James I of England," by Allen F. Westcott.

Desmond Fitz Gerald's announcements of new fiction include: "Thurley Ruxton," by Philip Verrill Mighels, and "The Infinite Capacity," by Cosmo Hamilton.

The spring list of Forbes & Co. of Chicago includes: "Americans All," by John Merritte Driver; "Buttered Toasts," by Fred Emerson Brooks.

The University of Chicago Press has in preparation: "The Elementary Course in English," by James Fleming Hosic; "The Theology of Schleiermacher," by George Cross, and "The Hebrew Prophets, or Patriots and Leaders of Israel," a text-book for pupils of high-school age, by Georgia L. Chamberlin.

The Putnams have in train: "Down Our Street," by Mrs. J. E. Buckrose; "William the Silent," a biography by Ruth Putnam; "More Than Kin," by Patricia Wentworth; "Log of the North Shore Club," by Kirkland B. Alexander, and "Aspects of Religious Belief and Practice in Babylonia and Assyria," by Morris Jastrow.

On behalf of the Cambridge University Press, the same house announces: "Roman Stoicism," by E. Vernon Arnold; "About Edwin Drood," by H. J.; "The Theory of Toleration under the Later Stuarts," by A. A. Seaton; "A Descriptive Catalogue of the Manuscripts in the Library of Corpus Christi College, Cambridge," by Montague Rhodes James; "An Easy Selection from Cicero's Correspondence," edited by J. D. Duff; "The Hexaplar Psalter—Being the Book of Psalms in Six English Versions," edited by William Aldis Wright; "Gilbert Crispin, Abbot of Westminster," by J. Armitage Robinson, D.D.; "The Revelation of St. John the Divine," edited by G. H. S. Walpole, Bishop of Edinburgh; "The First Book of Samuel" and "The Second Book of Samuel," both edited by A. F. Kirkpatrick, D.D.; "Judges," edited by John Sutherland Black, and "Ruth," edited by A. W. Streane.

Little, Brown & Co. have in their list: "The Land Claimers," by John Fleming Wilson; "The Moving Finger," by E. Phillips Oppenheim; "To Love and to Cherish," by Eliza Calvert Hall; "The Path of Glory," by Paul Leland Haworth; "The Spirit of the Island," by Joseph Horner Coates; "Buddie: The Story of a Boy," by Anna Chapin Ray; "The Captain of the S. I. G's," by Etta Anthony Baker; "Ancient, Curious, and Famous Wills," by Virgil M. Harris; "Practical Salesmanship," by Nathaniel C. Fowler, jr., and "Brain Power for Business Men," by Annie Payson Call.

"Classical Rome," by H. Stuart Jones, a new volume in Grant Allen's Historical Guides series, will be issued at once by Henry Holt & Co.

"The Peace Problem," by Frederick Lynch, is in the list of the Revell Co.

The University Presses of Oxford and Cambridge announce two new editions of the Revised Version, in which for the first time the text is divided into verses as in the 1611 Bible. Hitherto, the Revised Version has only been obtainable divided into paragraphs. One of the new editions, containing central column references, will be published on May 17, the thirtieth anniversary of the appearance of the Revised New Testament, when 1,000,000 copies were sold in the course of the day; and the other edition, text only, will be ready a few weeks later.

The University Presses have also ready for publication a cheap edition of "The Interlinear Bible," which combines the Authorized and the Revised Versions. Where the versions vary the passages are printed in smaller type, so arranged that the reader following continuously the upper line has the text of the Revised Version, or following the lower line the Authorized Version; and yet sees at a glance the difference.

The following books will appear April 15 from the press of Houghton Mifflin Company: "People of Popham," by Mary C. E. Wemyss; "France in the American Revolution," by James Breck Perkins; "The Ideal Italian Tour," by Henry James Forman; and "A Year in a Coal Mine," by Joseph Husband.

The Royal Society of Literature has arranged, according to the London *Athenæum*, for a strong Academic Committee, which now consists of thirty-three persons, including Joseph Conrad, Maurice Hewlett, and Henry James, and which "is to take all possible measures to maintain a good standard of English" by recognizing even unpopular work if it is of genuine literary merit.

Messrs. Luzac have in hand Prof. Hermann Gollancz's "Hebrew Glosses and Notes by Marco Luzzatto," which discusses Menasseh ben Israel's attempt to reconcile conflicting texts of Scripture.

Holders of letters from the late Henry Charles Lea will confer a favor by sending the originals or copies to Arthur H. Lea, No. 2004 Walnut Street, Philadelphia, who is preparing a biography of the historian.

The centenary edition of Dickens (imported by Scribners) is increased by six new volumes, including "Hard Times," "The Old Curiosity Shop" (2 vols.), 'Barnaby Rudge" (2 vols.), and "Christmas Books." We have already called attention to the make-up of this publication and its unusual excellence for the price (one dollar the volume). It will be completed in thirty-six volumes.

We have to record the appearance of two more volumes in Harpers' Thin-Paper edition of Thomas Hardy: "Life's Little Ironies" and "The Well-Beloved." As both the collection of stories and the novel are comparatively short, these two volumes have the advantage at once of slenderness and comfortably substantial paper.

"Hood's Texas Brigade" (Neale Publishing Co.), by J. B. Polley, is frankly based upon personal narratives and reminiscences, and shows few traces of the use of the official records of the civil war, Confederate or Federal. Fortunately, however, the author himself a member of the organization, tells his story in a straightforward fashion, with little bias, and with no more reference to the general operations of the Confederate armies than is necessary to make clear the movements of the brigade. A number of contemporary portraits are reproduced, and there is a muster roll of the brigade; but an index, well-nigh indispensable in a book of this character, is lacking.

No life of Nietzsche can ever take the place of that from the pen of his sister, Frau Förster-Nietzsche; although that work, it must be admitted, is inordinately long, and a little too sugared-o'er with sisterly affection. For those who desire something shorter than this, yet more detailed than the sketches hitherto printed in English, we can recommend heartily "The Life of Friedrich Nietzsche," translated from the French of Daniel Halévy by J. M. Hone, and published by the Macmillan Co. It is sympathetic, but does not blink the disagreeable aspects of Nietzsche's character and career. The account of the friendship and rupture with Wagner is particularly clear and just. As an interpretation of Nietzsche's philosophy the book needs to be supplemented by the treatise of Mr. Mencken or Mr. Kennedy, although neither of these expositions is, in the judgment of the present reviewer, entirely adequate. Hitherto the books written in English about Nietzsche—and their number is increasing with surprising rapidity—have been the work of partisans, and we have yet to read an exposition of his theories of the Superman and of conduct "beyond good and evil" which, without falling into diatribes of abuse, shall give them their true place in the history of philosophy. The Introduction of T. M. Kettle, M. P., to the present biography is well enough, but does not pretend to go deeply into philosophical questions. The translation, by J. M. Hone, is good.

The ninth volume of "The New Schaff-Herzog Encyclopedia of Religious Knowledge" (Funk & Wagnalls Co.) includes titles from Petri to Reuchlin. The work is much fuller than its German precursor in biographical articles, and contains a large amount of new and valuable material on minor topics in ecclesiastical history. The treatment of religious denominations and sects is especially full, with many facts and statistics difficult to find elsewhere in such concise and convenient form, *e. g.*, in the exhaustive article on the numerous branches of Presbyterians. Other denominational articles in the present volume are "Protestant Episcopalians," including a sympathetic sketch of the Cowley Fathers by Bishop Hall of Vermont; "Plymouth Brethren," "Reformed Episcopalians," and "Dutch Reformed Church." One of the longest articles is on "The History of Preaching," by the Rev. Dr. Edwin C. Dargan of Georgia, author of an elaborate treatise on the same subject published a few years ago. The joint article on "Puritans and Puritanism," by the Rev. John Browne of England and the Rev. Morton Dexter of Boston, is well written. Other noteworthy subjects are "Pietism," "Pope, Papacy, Papal System," including a chronological list of the Popes; "Protestantism," and "Rationalism and Supernaturalism," the latter by Prof. Charles A. Beckwith, departmental editor in systematic theology. In general this encyclopædia attempts to furnish accurate and recent information, embodying the results of the latest research, but does not undertake to supply monographs which present new theories or add to the sum of existing knowledge.

It has lately been so much the fashion to scrutinize eighteenth-century literature for signs of revolt against neo-classicism, writes Dr. Herbert E. Cory ("Spenser, Thomson, and Romanticism," Publications of the Modern Language Association of America, XIX, 1), that some critic of the future may gain novel distinction by proving that a school of Pope once actually existed. A revival of interest in Spenser has, in particular, been held an important factor in the development of nascent romanticism. But, Dr. Cory points out, the Augustans imitated Spenser as they did any accepted classic; self-consciously and somewhat mechanically, no doubt, but in a spirit neither of indifference nor of mockery. His sweetness, simplicity, and copiousness of fancy they recognized, but they had no difficulty in reconciling these with their classical models; and, indeed, one great aspect of his genius, now neglected, they were peculiarly fitted to appreciate—his didacticism. It was long before these neo-classic imitations showed any persistent spark of romanticism, anything which suggests the romantic reincarnation of the spirit of Spenser to be found at times in Keats.

Much, indeed, that is good in Thomson's "Castle of Indolence" is neo-classical—its gentle satire and its moral allegory. What Thomson adds, that is neither neo-classic nor Spenserian, is a spirit of "delighted doubt." It is not often that one encounters criticism of this sort, at once so acute and so broadly founded on the facts.

Dr. Arthur Drews presents in "The Christ Myth" (Chicago: The Open Court Publishing Co.) a study of Christian origins from the point of view of an idealistic monist. Relying mainly on W. B. Smith's "Der vorchristliche Jesus," he contends that there existed in secret pre-Christian Jewish circles a cult in which Jewish messianic speculations were blended with the widespread heathen myth of a suffering, dying, and rising god, and that the god of this cult was Jesus, a sun-god probably, like Joshua and Jason. Indeed, a papyrus, evidently of the fourth century of our era, explicitly says: "I adjure thee by Jesus, the god of the Hebrews." When Saul of Tarsus, who was at first offended at this blasphemous fusion of Jewish hope and heathen myth, began to catch the significance of the central idea of the Jesus-cult, the idea, namely, of a self-sacrificing god who becomes man, and as an expiatory representative of the people unites man with god; and when in the power of this idea his own longing for redemption was satisfied; then Christianity came into being. The Christ of Paul in so far as he is man is simply the human race considered as a person. The incarnation, death, and resurrection of Jesus represent not an actual but an eternal story in time. Hence to search after evidence in Paul, that is, Van Manen's Paul, of an historical Jesus is to betray a complete misunderstanding of the real founder of Christianity. To be sure, there are a few passages which seem to point to an actual Jesus, but such passages are either wrongly interpreted or are obvious interpolations.

In fact, not even the Synoptic Gospels or their two main sources, Mark and Q, compel the assumption of an historical Jesus. As for Mark, Wrede has shown how unreliable it is as a source for the life of Jesus; and Schweitzer has rightly insisted that the figure of Jesus depicted by German liberal critics is pure fiction. Mark's narrative gets to be intelligible only when it is recognized that it reflects the constant traits of the god-redeemer myth. As for Q, even Kähler admits that we possess no single authentic word of Jesus. In fine, "the life of Jesus, as portrayed by the Synoptics, merely brings to an expression in historical garb the metaphysical ideas, religious hopes, the outer and inner experiences of the community which had Jesus for its cult-god" (p. 264). Such, briefly, is the line of argument of the book, which is creating a stir in German theological circles. There are some who have become convinced that Jesus never lived, just as there are some who believe that Queen Elizabeth was a man. But such great faith is not yet for all. The English translation is made from the third German edition, and fairly reproduces the original. The publishers would render an even greater service if they would undertake an English translation of the less popular but more important work of the Tulane professor already alluded to, "The pre-Christian Jesus."

Much of value is to be found in a recent volume entitled "State Socialism in New Zealand" (New York: Thomas Y. Crowell & Co.). The book is the work of two collaborators, Prof. J. E. Le Rossignol of the University of Denver and Mr. W. D. Stewart, a barrister-at-law in Dunedin, New Zealand, the result of whose collaboration is very happy. In the opening chapter the fact is brought out that the notable differences in regard to governmental functions between the New Zealander on the one hand and the Anglo-Saxon of the United States or Canada on the other must be due to environment, rather than to differences in character. The beginnings of state enterprise were closely connected with governmental ownership of land and building of railways. The chapter on Roads and Railways corrects a common misconception held in America as to the nature of railway travel in New Zealand. It tells us that "on most of the branch lines the service is infrequent, seldom exceeding one train a day each way," and that the speed of the trains is much less than in the United States; express trains are said to travel from seventeen to twenty-five miles an hour. Passenger fares about equal, and freight charges considerably exceed, the corresponding rates in the United States. Nevertheless, railway service is being rapidly improved, and transportation charges are steadily being reduced, in conformity with the theory that all revenues in excess of necessary expenses should be returned to the general public. The government of New Zealand furthermore operates life, fire, and accident insurance offices as a distinct state department. Here, too, there is no intention of making profits, and the state offices are taxed and otherwise treated like an ordinary company. The volume takes up such other topics as the land and income tax, old-age pensions, the arbitration act, wages, and cost of living.

In her latest work, "The New New Guinea" (Philadelphia: J. B. Lippincott Co.), Miss Beatrice Grimshaw has two ends in view. One is to show how the Territory of Papua, for this is now its official title, is being transformed since it came under the control of the Australian government a few years ago. To describe its wonderful undeveloped natural wealth in such a way as to attract the white planter is the other. The necessary information she gained in a year and a half spent in this country, during which she "travelled into every part attainable without an exploring expedition," at times with the Lieutenant-Governor on his official tours. Her account of these trips and of the tactful and peaceable way in which friendly relations are being established with hostile natives is interesting and encouraging. It seems not unlikely that before long cannibalism with them will be a custom of the past. In some places they are beginning to show an intelligent interest in agriculture, and to aid in this there are four government plant nurseries where seeds and cuttings of all plants suitable for cultivation can be obtained. Many are efficient laborers on the plantations of white settlers, who have come since the advent of the Australian government. What a promising field Papua is to the European with means, the authoress clearly shows. The soil and climate are peculiarly adapted to the raising of sugar, cotton, coffee, copra, and rubber, while in some districts four crops of maize in a year can be grown. The vast forests contain woods of great value and variety, and the country is "exceedingly rich in valuable minerals." Among her many interesting experiences the most unusual was what she terms her "diving début" at the Thursday Island pearling grounds. She says:

It is a strange sensation, this "walking alone in the depths of the sea," and one that I think no one could describe adequately. To get away from the laws of gravity as you have known them all your life is in itself a somewhat disorganizing experience. And the laws of gravity do not act at the bottom of the seas as they do on land. . . . Fish swim past you green and gray in the green water. You realize with something of a shock that they are not afraid of you. On the deck of the sloop, the mere shadow of your hand would send them flying as they glide past the ship's counter, but here in the depths of the sea they fin their slow way up to the very windows of your helmet, and look in at you with their cold, glassy eyes, unafraid.

Regarding the book as a whole most, if not all, of its readers will agree that it shows convincingly that "the pluck, determination, and strength" of the Australians have changed a useless tract of savage country into a "habitable, peaceful, and flourishing colony." There are forty-nine reproductions of photographs, a map, but no index.

The death is reported, in his seventieth year, of John Charles Freeman, since 1879 professor of English literature in the University of Wisconsin. He was United States consul at Copenhagen in 1900, and the following year United States chargé d'affaires. He edited Xenophon's "Memorabilia" and the "Dialogues" of Lucian, and wroto a "History of American Literature."

Charles Frederic Moberly Bell, who died suddenly last week, had been managing director of the London *Times* since 1908. He was born in 1847, was the *Times* correspondent in Egypt from 1865 to 1890, and wrote threo thoughtful books: "Khedives and Pashas," "Egyptian Finance," and "From Pharaoh to Fellah."

The Rev. Dr. Alexander Mair, whose death is announced from Edinburgh, was the author of "Studies on the Christian Evidences."

Science

Biology, General and Medical. By Joseph McFarland, M.D. With 160 illustrations, including five plates. Philadelphia: W. B. Saunders Co. $1.75 net.

The pioneer "Elementary Biology" of Huxley and Martin was mainly a guide to the examination of selected animals and plants. The recent "Biology" of Needham combines that feature with a simple and progressive presentation of the main facts and principles relating to organisms. The present work contains only incidental suggestions as to personal observation by the student; in his own words:

It has been the purpose of the author to acquaint his readers with the peculiar na-

ture and interesting reactions of "living substance"; to help him [them?] to trace it to its probable (though unknown), beginnings and follow it through its multifarious differentiations to its highest complexity. . . . All of the subjects treated are of interest and importance to students of medicine and physicians.

Following are the chapter titles:

The cosmical relations of living matter. The origin of life. The criteria of life. The manifestations of life. The cell. Cell division. The higher organisms. Reproduction. Ontogenesis. Conformity to type. Divergence. Structural relationship. Blood relationship. Parasitism. Infection and immunity. Mutilation and regeneration. Grafting. Senescence, decadence, and death.

All these topics are important, and interesting either *per se* or because of their significance. The author treats them modestly, judicially, and with varying degrees of fulness and accuracy. Especially commendable is the chapter on Infection and Immunity, a subject embraced within one of the author's other two works, "Pathogenic Bacteria," of which the Saunders Company has issued the sixth edition. But author and publisher should have realized that such a variety of difficult topics could not possibly be presented adequately in one small volume or accurately by one individual. The author acknowledges valuable suggestions and criticisms from a friend and colleague. But with so comprehensive a treatise the manuscript or proof, as a whole or in part, should have been submitted to at least ten specialists in their respective branches. Among them the author would have been warned against the declaration (p. 218) that "every embryo . . . has at every stage peculiarities which distinguish it from every other genus and species"; he would have been told that "homologues" on p. 109 should be analogues; that the process called "plant respiration" on p. 89 is really photosynthesis; and that the statement on p. 103 as to the relative numbers of chromosomes in the somatic and the germinal cells is the reverse of the fact.

There are numerous errors as to both common and technical words. The index lacks at least a score of entries. There should be a full glossary of the comparatively unfamiliar terms with which some pages almost bristle.

The plates are excellent, and many of the figures in the text are well-chosen and clear; others are on too small a scale or insufficiently explained. The following case exemplifies the lack of due provision for the needs of students and lay readers. On p. 124 is a good figure of the "nettling cells" of *Hydra*. There is no reference to fig. 41 where the entire animal is represented for the sake of orientation; neither is there reference to p. 126 for an account of the process of "exploding" the cell. Opposite p. 126 is represented a motor nerve-cell; the figure lacks clearness, has no relation to the adjacent text, and is not referred to fig. 57, the more comprehensive scheme of nervous action, which itself is nowhere adequately elucidated.

At the close of each chapter are named from two to sixteen publications on related topics; among the seven for the chapter on Infection and Immunity two by the author are presumably compilations, like the present work; yet the original researches of V. A. Moore and Theobald Smith are nowhere mentioned. With a volume intended for general readers as well as for medical students, the sixteen advertising pages might have been devoted to more appropriate titles. These pages, by the way, are of better paper than the book itself, which, as a whole, hardly supports the claim of the publishers to "set a standard for mechanical perfection and scientific superiority."

In Frederick A. Stokes Co.'s list of science books we note "The House-Fly—Disease Carrier," by Leland O. Howard.

Lemcke & Buechner, acting as agents for the Columbia University Press, will bring out Prof. H. E. Crampton's "Doctrine of Evolution."

"Psychic Phenomena, Science and Immortality," by Henry Frank, and "Man's To-morrow," a treatise on immortality by William W. Kinsley, are soon to be issued by Sherman, French & Co.

Forbes & Co.'s list includes: "Truths—Talks with a Boy Concerning Himself," and "Confidences—Talks with a Young Girl Concerning Herself," both by Dr. E. B. Lowry.

In Longman's list of announcements we note: "New Ideas on Inorganic Chemistry," by Prof. A. Werner, translated by Dr. E. P. Hedley; "The Chemistry of Synthetic Drugs," by Percy May, and Lord Avebury's book "On Marriage, Totemism, and Religion: A Reply to Critics."

The division of the population of the different countries of the world according to sex is shown in *Petermann's Mitteilungen* for January and February. It seems that there are trustworthy census returns for 61 per cent. of the total population of the earth, and that women are in a minority in this thousand million by 4,600,000. Taking the continents as a whole, Europe has 5,600,000 more women than men, while Asia has 8,000,000 and America 2,400,000 less. In ten States, New Hampshire, Massachusetts, Rhode Island, New York, New Jersey, Maryland, Virginia, North Carolina, South Carolina, Georgia, as also in the District of Columbia, women are in the majority.

The United States Department of Agriculture has recently issued a bulletin (Farmers' Bulletin No. 433) describing the cultivation of cabbages from the points of view, respectively, of the home gardener, the market gardener, and the truck farmer.

Capt. James Evelyn Pilcher, U. S. A., retired, who died in Savannah on Saturday, at the age of fifty-four, had occupied the chair of military surgery in the Ohio Medical University, Starling Medical College, and in Creighton Medical College; he was at one time professor of sociology and political economy in Dickinson College, and professor of military jurisprudence at Dickinson Law School. He was the author of "First Aid in Illness and Injury," "Life and Labors of Elijah Holmes Pilcher," "Columbus Book of the Military Surgeons," "The Arms and Seals of the State of Pennsylvania," and "The Surgeon Generals of the Army."

Drama

Sardou's "La Perle noire," edited with notes and vocabulary by Dr. Kennetb McKenzie, and Jeanne Charbonniéras's "Un Bal manqué" are soon to appear from William R. Jenkins's press.

Badger announces for immediate publication abridged translations of "The Creditor," by Strindberg, and "A Man of the World," by Marie von Ebner-Eschenbach.

Walter S. Hinchman has written "William of Normandy" (London: Kegan Paul, Trench, Trübner & Co.), in the form of a chronicle play, and an interesting story be has made of it. For stage purposes, even if presented in the Elizabethan fashion—the only possible way—it would probably prove unsuitable, because of the preponderance of dialogue over action, and the lack of progressive dramatic suspense. To cut the dialogue would result in depriving the piece of its chief significance and value. It is written in smooth and forcible blank verse, of distinctly poetic quality, though without pretence of inspiration or any indulgence in rhapsody. There is scarcely a line in it that is not pertinent to the personage or the occasion. Imagination, which it does not lack, is not allowed to interfere with the known facts. The spirit and conditions of the time (1071-1087) are reflected with scholarship and sufficient accuracy. There are, necessarily, but unfortunately, long gaps in the historical story—years are supposed to elapse between the acts, the tale opening with the event that led to the sack of Ely and jumping to the fatal close at Rouen. The merit of the work lies, not in the perfection of the chronicle, but in the portrayal of the characters concerned in it. This is consistent and vital. The masterful figure of William, if somewhat over-gilded with human virtues which do not rightfully belong to him, is vigorously and, in the main, truthfully depicted, and his relations, paternal and political, with his fiery and irresponsible heir, Robert, are vividly and effectively sketched. Robert himself is an admirable study of aspiring, reckless, passionate, but essentially gallant and generous youth. Matilda is a noble and tender woman, while the character of the crafty warrior-priest, Otho, is drawn with a skill that carries with it the conviction of veracity. Many of the minor characters of the drama—Anselm, Lanfranc, Shrewsbury, Warwick, and other barons—are drawn with notable realism and consistency. In short, this is an excellent piece of work, which will bring to any intelligent reader both pleasure and profit. But before the footlights—should it ever get there—it would probably be doomed to

failure, by the lack of competent players to act or speak it, if for no other reason.

Grace George opens William A. Brady's theatre in Forty-eighth Street, "The Playhouse," this Saturday, with two performances of "Sauce for the Goose," the new comedy, written for her by Geraldine Bonner and Hutcheson Boyd. She will then resume her tour. In the autumn she will head the stock company which is to present a series of plays, old and new, in this latest addition to New York's places of dramatic entertainment. In "Sauce for the Goose" Miss George will play the part of a young wife whose abilities have been underestimated by her literary husband, who neglects her for another woman. In the conflict of wit and intrigue which follows she proves herself much more than his match, and, in the end, he is only too glad to be permitted to return to his allegiance. The dramatic scheme is an old one, which has done good service in the past, and may be put to still better use in the future. Mr. Brady's plans for the house next season seem to be of an ambitious character. He proposes to follow the policy originally outlined by the New Theatre, and to organize a first-class company for the presentation of all that is best in the old and contemporaneous drama. Among the modern authors to be interpreted he mentions Ibsen, Shaw, Sudermann, Rostand, Broadhurst, Edward Sheldon, Thompson Buchanan, Margaret Mayo, and others, while he promises revivals of Shakespearean and other classical plays. It is a fair programme; but possibly he, too, may discover that these things are more easily said than done. Good plays are plentiful, good performances exceedingly rare. His stock company would inspire greater confidence if he did not purpose to have a star at the head of it.

The London critics are not all of one mind as to the quality of "Lady Patricia," the comedy by Rudolf Besier, which has just been produced in the Haymarket Theatre. The plot of it, evidently, is a flimsy artificial thing. A scientific husband of ripe age has a lovely romantic wife, who grows somewhat weary of his virtues and so enters upon a platonic flirtation with an agreeable youth. Presently the husband, feeling himself neglected, seeks consolation (also purely platonic) in the society of a young girl, daughter of a Dean. The youth and the girl actually are in love with each other, but are flattered by the attentions of their mature admirers. Through the maladroitness of an old servant, comic complications arise, and are disentangled in due course, and all ends well. One critic says: "Playgoers of robust appetites will say it is all *hors d'œuvre*, or more sauce than fish. That cannot be gainsaid. Mr. Besier in avoiding the heavy has not perhaps guarded against the opposite pitfall of the flimsy." Another and more enthusiastic observer writes: "'Lady Patricia' will live. Here is the 'literary drama' to a certainty. It is not merely literary drama, it is literary farce. Much better, it is a delightful play and an hilarious entertainment."

When Pinero's comedy, "Preserving Mr. Panmure," has run its course at the London Comedy Theatre, it will be succeeded by a version of Ferenc Molnár's "The Lifeguardsman," which has been written by Capt. Basil Hood, who has anglicized the piece very thoroughly. Indeed, according to report he has retained little of it except the skeleton. There are only half a dozen characters of any importance, and one of these does not figure upon the programme. Robert Loraine, Alexander Carlisle, and Mrs. Charles Calvert are among the principal performers.

Henry Ainley is to play the part of Gaybor Arany in "The Concert"—the character enacted here by Leo Ditrichstein—when the piece is produced in London.

Robert Arthur is to establish a stock company in the London Coronet Theatre, for the presentation of old and new plays, but will engage special stars, a policy which is utterly subversive of the true stock-company idea. He will begin, on the 24th instant, with a series of Shakespearean revivals, in which Alice Crawford will be seen as Rosalind, Beatrice, Viola, and Katharine. After this, he proposes to present some new dramatizations of Dickens, including versions of "Dombey and Son," "Bleak House," "David Copperfield," and "Great Expectations."

Alvah S. Lipman, an actor, who died last week in his fifty-seventh year, had been connected with the stage since early youth. He made his first success in "Editha's Burglar"; he played the title rôle in "Jim Bludso" and was a member of the companies of Eleanor Robson, Mary Mannering, and May Irwin. He wrote several plays in collaboration with Florence Gerald, one of which, "The Sunset Limited," was recently produced at the Broadway Theatre.

Music

Some Forerunners of Italian Opera. By W. J. Henderson. New York: Henry Holt & Co., $1.25 net.

Many Americans will undoubtedly visit Rome this year and there hear some of the historic operatic performances covering the time "from the madrigal compositions and comic intermezzi of the cinquecento to the intensely dramatic lyric creations of the contemporary period," as the official prospectus has it. These exposition visitors, if seriously minded, will do well, in packing their trunks, to include, besides their Baedeker, a copy of Mr. Henderson's new volume, which is a short study of the lyric drama in Italy prior to the birth of opera as shaped by the Florentine reformers toward the end of the sixteenth century. It begins with the assertion that "the modern entertainment called opera is a child of the Roman Catholic Church," and the first two chapters are devoted to tracing the liturgical ancestry in the processions and ceremonies, the costumes, and the delineation of episodes of religious history, such as the strange fête of the ass at which priests and congregation heehawed as realistically as they could. This festival dates from the eleventh century, and open-air performances of religious dramas, with music and dancing, took place in the twelfth, if not sooner.

The bulk of the volume—seven chapters of 111 pages—is devoted to a study of the character and performance of the first Italian secular drama, the "Orfeo" of Poliziano; this study, the author declares, is the result of some years of labor. He believes that what he has to offer on this topic will be found to possess historical value; and such it doubtless has. While some of the conclusions reached are conjectural, much ingenuity is displayed in disentangling the actual facts from misleading and conflicting evidence, and the bibliographic footnotes show that the writer has studied his subject exhaustively. Mantua was the birthplace of the secular drama with music; of Mantua's intellectual atmosphere, its activity and importance as a literary and musical centre, the author gives a vivid picture, after stating the reasons why there was no drama in the Middle Ages till the church began to revive it in liturgies and sacred representations. It is not without significance that the legend of Orpheus, chosen by Poliziano, subsequently also inspired the originators of real Italian opera, Peri and Caccini, and the epoch-making Monteverdi and Gluck to write operas of historic importance; Gluck's is the oldest of all operas that have remained in the modern repertory.

While Poliziano's "Orfeo" was musically as different in character from the opera as from the liturgical drama, Mr. Henderson tries to show that none the less it contained some of the germs of the modern opera. It had its solo, its chorus, and its ballet. The story itself made "an ideal opera book," and the points at which the music must have been heard are clearly indicated by the text. Unfortunately, all record of the music itself appears to be lost. By the use of what might be called circumstantial evidence, the author proceeds to guess what sort of music it was, with an ingenuity which finally makes him pause, lest reconstructive ardor should carry him too far. But the search for the probable style of the music in this play, casts instructive sidelights on many points in the musical practice of the period. The scenic and lighting problem are also discussed, and the final chapters are devoted to disquisitions on the frottola and madrigal dramas, the influence of the Netherlands on musical Italy, the growth of the comic element resulting in opera buffa, and the birth of real Italian opera, which came about through a revolt against florid singing quite as much as through a reaction against polyphonic complexity.

Madame Adelina Patti (Baroness Cederström) has generously offered to give a concert, on June 1, at the Royal Albert Hall, for the benefit of her old friend, Wilhelm Ganz, who since last December has been unfortunately kept by an accident from all

work. Patti was born sixty-eight years ago.

Massenet's "Don Quixote" has proved a great success in Paris. When he was asked the other day which was his favorite opera, he replied that he thought it was "Thérèse," which will soon be produced in Paris. It was written before "Don Quixote." His latest work, "Rome Vaincue," is to have its first hearing at Monte Carlo. Massenet is in his sixty-ninth year. When asked whether he now intended to rest, he answered: "Never! I am already at work on the opera to follow 'Rome Vaincue.'"

In a Berlin lecture on Strauss's new opera, "Der Rosenkavalier" Dr. Max Burkhardt declared that neither the composer nor the librettist had succeeded so far as the humorous element was concerned. He said Strauss had fallen short of real spontaneous humor, in spite of brilliant coloring and orchestration and in spite of some excellent musical jokes. Burkhardt further stated that even the waltzes, so brilliant during the first few numbers, soon grew dull, and proved that Strauss, after all, could not write a real waltz; that Strauss lacked the flow of melody which had made the classic comic operas immortal.

Théodore Radoux, whose death is reported at the age of seventy-five, was director of the conservatory at Liège and the author of two *opéras-comiques*, "Le Béarnais" and "La Coupe enchantée," and an oratorio, "Cain."

Art

Cathedrals of Spain. By John A. Gade. Boston: Houghton Mifflin Co. $5 net.

Unless the tourist has made a thorough study of architecture and is well acquainted with the structural media the architect employs, he can never fully appreciate the artistic value of the great cathedrals of Europe. One who is not thus instructed will be fortunate if, in visiting the cathedral cities, he can gain the companionship of some intelligent architect who will point out to him the special problems presented to the designers for solution, and the procedure by which they aimed to solve these problems. In the book before us Mr. Gade, who is an architect, travels with the reader through Spain, and in the study of its most important cathedrals attempts to supply the place of such a companion for those who are not fortunate enough to obtain one in the flesh. The task thus set for himself he has accomplished with no little success: and although the book is distinctly an architectural guide-book, the non-professional traveller will find it not only useful but readable; for it contains something more than is given in a Baedeker, and is enlivened by occasional imaginative descriptions foreign to the habit of the ordinary guide-book writer. For the general reader who has not visited Spain the book is naturally much less satisfactory. The text, indeed, is embellished with many fine photographic plates, but it is obviously impossible to show in such illustrations any large proportion of the details to which reference must be made.

The Spanish cathedrals are notable for their size, are intensely interesting historically, and are instructive to the philosophically inclined architect as indicative of the result of the ready assimilation of architectural styles borrowed from other lands. The social demands of the rival wealthy communities compelled the construction of these vast piles; but the builders were not intent upon the development of any inherited architectural style, being satisfied to adapt to their own needs architectural forms used by their rivals in other lands whom they wished to impress with their own greatness. Their cathedrals thus appear as an expression of the social genius of the people rather than of their artistic convictions; and the unconscious recognition of this fact leads the casual visitor in Spain to turn his attention less to its cathedrals than to the land, and its people, and to such non-ecclesiastical architectural remains as tell of the real interests of the powerful races that contended for mastery through so many centuries. The ordinary tourist naturally hesitates to devote to the cathedral in Granada, for instance, any large part of the time allotted to a visit to this enchanting spot, which can seldom be long enough to satisfy one's interest in the Alhambra and Generalife, with their wealth of gardens, their panorama of the distant Sierra Nevada, and their vistas of the golden plains. From such joys we must be enticed if we are to study the cathedrals of Spain, and Mr. Gade has done well to write this monograph which will lead the traveller to note much of interest that he might otherwise overlook.

Louis Hourticque, inspector of fine arts of the city of Paris, has placed his book, "The History of Art in France," with the Scribners.

"Portrait Book of the Kings and Queens of Great Britain," by Charles E. Pascoe, and "Chats on Old Pewter," by J. L. J. Masse, are announced by Frederick A. Stokes Co.

"Lady Charlotte Schreiber's Journals," illustrated with above a hundred reproductions of ceramics and antiques, are published this week by John Lane Co.

Dr. George Herbert West is publishing through Bell & Sons "Gothic Architecture in England and France."

We learn that the pictures of châteaux in France, painted by Cotello by order of Louis XIV for Versailles, will be removed from the dining room at the Palace to the Trianon.

A picture representing the death of the Virgin by Holbein the elder has recently been added to the museum at Budapest.

"Schools of Painting" (Putnam) by Mary Innes is edited by Charles DeKay for American use, and the last chapter, on American painting, is by his hand. This book claims the distinction of being written in untechnical style for beginners. Such merit may be conceded, and also the excellence of the illustration. But the title is a misnomer. There is no clear discrimination and characterization of schools. The book is merely the usual history compiled along biographical lines and displaying the customary defects of lack of accuracy and proportion. The dates of Foppa and Antonello da Messina should be corrected in the light of recent research. The value of the treatment of the Florentine school may be measured by the fact that Antonio Pollaiolo is omitted. In short, about all that can be said for the book is that it does in some fashion cover in one volume the whole range of post-classical painting.

There is very wide interest in anything connected with the building and furnishing of country houses, if one may judge by the vast number of publications concerned with such matters. Prof. C. F. Osborne has taken advantage of this to offer in "The Family House" (the Penn Publishing Company) a great deal of practical advice to the man who takes his home-making seriously. Questions of site, exposure, disposition, and construction are clearly treated, and should be of real assistance to the house-renter or house-builder of moderate means—but, unless he is a man of more than moderate leisure, it may prove better economy to ask an expert's opinion than to master the somewhat technical chapters on heating and ventilating.

Mr. Oeconomou, ephor of antiquities in Corinthia, Argolis, and Arcadia, has presented a report to the Greek Archæological Society on the excavations which were made near the Theseion in Athens in the hope of finding the ancient Agora. Among the objects discovered the most important is a torso of a beautiful statue of Apollo, which Mr. Oeconomou identifies with the statue referred to by Pausanias as being executed by the sculptor Euphranor. There were also found several important inscriptions, one containing a law on the Aparchai of Eleusis; another relating to the mines of Laurion; and a third mentioning for the first time the name of an Athenian archon called Athenodorus. It should appear from the inscriptions that under the Theseion there was situated the famous Metroon of Athens, the position of which has long been a disputed point.

At a meeting of the Austrian School of Archæology at Athens, Mr. Premerstein, the director, gave an interesting account of the researches on the plain of Elis, an extensive area near the mouth of the river Peneus, known as the "Curved Elis." Remains of columns were unearthed, which perhaps came from the Temple of Athena described by Pausanias. The most important of the buildings discovered was the Octagonon. Near this edifice, which in Christian times was transformed into a church, were found a number of inscribed tombstones. In one of the tombs there was discovered a beautiful gold ornament (now placed in the Museum at Athens); in others vases of local manufacture, which will prove of special interest to archæologists.

Louis Oscar Roty, the French medallist, died a fortnight since, aged sixty-four.

Finance

PAST, PRESENT, AND FUTURE.

Wall Street is alternately the slave of precedent, in the sense of believing that things which happened once under given conditions must happen in just the same way when similar conditions return, and a rebel against precedent, in the sense of believing that new financial contrivances and new economic forces have made useless the teachings of the past. Just now, its mood inclines to deep respect for precedent. Perhaps the reason is that the contrary attitude of scorn at all who described the boom of 1909 as a duplicate of the ill-fated boom in the second year after 1893, has been rendered untenable by subsequent events. The premature demonstration of 1895, with its rise in commodities, its excited Stock Exchange speculation, and its record-breaking iron production, collapsed over-night as it were; a year or more of profound depression followed. To the exactly similar "boom year" 1909, coming at a similar interval after a great panic, the sequel was the same

This being so, it certainly is not strange that Wall Street should again be making its bow respectfully to precedent, and asking what our past financial history foreshadows at this present juncture. The nearest precedent is familiar. We are now in the fourth year after the panic of 1907; a corresponding interval after the panic of 1893 brought the country to the early months of 1897. The "after-panic boom year," 1895, had by that time been almost forgotten; we were living under the shadow of the prolonged reaction and liquidation of 1896. In that respect, the resemblance to the present position of affairs is manifest.

It is so in other ways. At the opening of 1897, the country's industry was marking time; the pulse of the Stock Exchange had almost ceased to beat; in April, sales had averaged only 125,000 shares a day. Commodity prices were falling; even steel rails declined in February from $28 to $25. Dividends of several railway companies were reduced. In April (such are the accidental parallels of history) stocks declined abruptly on an anxiously-awaited Supreme Court decision against the corporations—the "Trans-Missouri Railway case," under the Anti-Trust law of 1890.

But on the other hand, money went at 2 per cent. for two-months' Wall Street loans; the New York surplus bank reserve was larger even than it is to-day; loans of all the country's national banks were down $65,000,000 from the year before, and, in response to the lower prices, excess of merchandise exports, which had been only $70,500,000 for the nine months ending with March, 1896, was $323,000,000 for the same period up to the end of March, 1897—a figure quite unprecedented in that era. The result we know. In May the stock market began to rise; in June a genuine "boom" was under way; in August our famous bumper wheat crop in the face of European famine, and the rapid recovery in general trade, changed the whole face of the situation. We were fairly on the way to the great financial and industrial revival.

Thus 1897 is a highly agreeable precedent for the fourth year after a great financial panic. But it is not the only precedent. We have also the period following the September panic of 1873, and the month whose distance from the acute disturbance of that year corresponded to the present occasion was March, 1877. Let us see what was happening then.

The story differs curiously from that just narrated. There was in 1877, as there is to-day, a halt in the movement of industry and finance, but it was a halt inspired by well-grounded apprehension. In that very month, rate wars broke out among the railways; earnings were poor, dividends low, and severe retrenchment necessary. The economies took the shape of cuts in wages; what followed was the savage railway riots of July in the Pittsburgh district. Stock market prices swept violently downward, and in almost all respects it was an unhappy financial year. It was saved from a continuous story of reaction by the harvesting of wheat and corn crops larger than any previously gathered in this country, and the largest cotton crop since the civil war. There was no foreign shortage, as in 1897; but abundant home production served at least to check the business depression of the day, and in the autumn, trade activity increased and Stock Exchange prices rose. But it was a very slow recovery, and at the end of 1877, a year and a half was still ahead of the United States before it was able to taste the fruits of genuine trade revival.

Why should a situation, which so closely resembled both in chronology and in general aspects those of 1897 and of 1911, have produced results so different from what occurred in 1897 and from what every one hopes will occur this year? There are various theories. One is that the shock of the 1873 panic had been more severe than that of any which came afterward—a supposition partly confirmed by the fact that no such vigorous effort of recovery occurred in 1875 as occurred two years after the panics of 1893 and 1907. Another theory is that the depreciated currency of the seventies obstructed genuine revival—which, in fact, did not come, until after resumption of specie payments in January, 1879. A third, and rather plausible, explanation is that Europe itself had been financially damaged in 1873 as it was not in 1893; in other words, that the worst of the period's financial crisis came on the Eastern and Western hemispheres simultaneously, leaving neither in any shape to help the other out.

Yet another, often heard, is that the world's gold output was decreasing, as against its immensely rapid increase after 1893. But this last explanation will not hold. There were no such huge additions to that annual output in the seventies as occurred two decades later; but as against the $90,700,000 of 1874, a progressive yearly increase had occurred, even in that generation, to the $114,000,000 of 1877.

QUICKSANDS

A NOVEL

By Fannie Heaslip Lea

12mo. Illustrated. $1.20 *net.*

Brilliant dialogue, a subtle sense of the comic and the tragic, a graphic touch in the portrayal of an attractive group of people and their environment, and, in general, a fine artistry, characterize this novel, which presents a recurring problem—a wife out of love with her husband and deep in love with another. How she contrives to save something of honor and happiness from shipwreck is the theme of this engrossing story.

STURGIS & WALTON CO.
31-33 E. 27th St., New York

The reminiscences of "the ambassador of international journalism," and "the foremost diplomatist of modern times."

George W. Smalley

European Correspondent of the "New York Tribune," and sometime American Correspondent of the London "Times."

Anglo-American Memories

Mr. Smalley's long and active life has brought him into contact with celebrated men and women of leading position in Europe and America, and he has a first-hand knowledge, from the inside, of the chief political and social events of the past sixty years. "More even than Blowitz, was he the ambassador of international journalism. To them the exalted official world, usually inaccessible to most of their profession, was always open."

8vo. Illustrated. $2.50 net.

A. Massey, 136 Upper Tulse Hill, London, England.

THIRD EDITION NOW READY

JohnBrown:ABiography Fifty Years After

By OSWALD GARRISON VILLARD

SOME TRIBUTES TO THIS REMARKABLE HISTORICAL WORK.

Philadelphia PUBLIC LEDGER. "A tremendous book; more thrilling than any book of fiction, powerful in its appeal, and which, while it is written soberly, as befits history, by the very nature of the narrative often rises to the highest dramatic level."

THOMAS WENTWORTH HIGGINSON. "I can only say after reading from first to last its more than 700 pages that I have never encountered anything this side of Gibbon's 'Rome' which has made me feel more the personal power of a single work."

JOHN T. MORSE, Editor American Statesmen Series, in ATLANTIC MONTHLY. "Perhaps in thus dramatically fashioning his volume, Mr. Villard obeyed an instinct rather than acted upon a preconceived plan; that is often the case with a great work, where a writer's feelings are deeply enlisted. Be this as it may, the merit and charm are none the less; he has seized well a splendid opportunity and has written one of the great biographies of our literature."

HORACE WHITE. "In my judgment a contribution to American literature to take rank with the very best historical writing of our time or any time. The only impartial history of the Kansas war."

ST. CLAIR McKELWAY in the Brooklyn EAGLE. "A biography replete with facts and marked by courage and candor, learning and justice."

Portland OREGONIAN. "The most valuable and comprehensive biography issued this season, and the best and most candid estimate of John Brown."

W. E. CONNELLEY in the Topeka CAPITAL. "The unprejudiced student and seeker for truth will herald the book as a great contribution to American history."

Des Moines CAPITAL. "More powerful in its appeal, more dramatic than any book of fiction, is this wonderful biography of John Brown."

The North Carolina REVIEW. "In this biography Mr. Villard has touched high-water mark. The book is a delight to the reader for many reasons. Full of life and movement, . . . written in an attractive and scholarly style, full of sympathy and yet without any loss in accurate presentation, it sets a new standard for biographical efforts."

Baltimore AMERICAN. "While the book has popular features in that it is entrancingly interesting, its scholarship is of the highest order and its style reminds one a little of Anthony Froude. . . . Mr. Villard has illustrated in this book the finest ideals of literary conception and execution."

London TIMES. "It is scarcely likely that any later writer will be able either to add anything of importance to Mr. Villard's collection of material or to better his interpretation of the whole story. . . . It at once becomes the standard, and probably the final authority on its theme."

Washington (D. C.) STAR. "Mr. Villard draws a compact, vivid, historic picture of the terrible focussing of this period upon our Civil War. Straight and clear in its literary way, this biography is a marvel of research and fair-mindedness."

HENRY WATTERSON in Louisville COURIER-JOURNAL. "No fault may justly be found with Mr. Villard's telling of the story. It is minute and lucid, altogether fair and unvarnished."

Burlington (Iowa) HAWKEYE. "It is a book which will take a place in the library of every well established home in this part of the country."

First Edition, October 1st; Second Edition, November 21st; Third Edition, March 1st.

Fully illustrated with portraits and other illustrations. With copious notes and bibliography.
$5.00 *net. Postage* 26 *cents.*

HOUGHTON MIFFLIN COMPANY
BOSTON **NEW YORK**

"There can be no doubt that the Robert Hoe Sale will constitute, in the way of aggregate totals, the greatest event of its kind in the annals of Book Auctions."
From the LONDON TIMES, Oct. 21, 1910.

THE FIRST SALE
of the
Robert Hoe Library
Will Begin on
MONDAY, APRIL 24th, 1911,

and will continue through the following two weeks, excepting Saturdays and Sundays. Two Sessions will be held each day, beginning at 2.30 and 8.15 P. M., in the main gallery of the NEW BUILDING of THE ANDERSON AUCTION COMPANY, at Madison Avenue and Fortieth Street, New York.

This first and most important sale will constitute about one-fourth of the entire Library, which numbers about 16,000 items and is made up from all classes of books in the collection, including

ILLUMINATED MANUSCRIPTS, INCUNABULA, HISTORICAL BINDINGS, EARLY ENGLISH LITERATURE, RARE AMERICANA, FRENCH ILLUSTRATED BOOKS, EIGHTEENTH CENTURY ENGLISH AUTHORS, AUTOGRAPHS, MANUSCRIPTS, ETC.

THE CATALOGUE (illustrated) will be issued in four parts of about 600 pages each, with indices. Orders for the complete set will be received at $5 per set, or $1.50 for each part. PART I., IN TWO SECTIONS, IS NOW READY FOR DELIVERY. Other parts will be issued prior to each sale.

THE EXHIBITION at Madison avenue and 40th street will be open to intending buyers on and after APRIL 10TH. Expert information will be given and commissions executed at the sale upon request.

The Anderson Auction Company,
Madison Avenue at Fortieth Street
and (until May 1)
Twelve East Forty-sixth Street,

The UNITARIAN ADVANCE

A MONTHLY MAGAZINE OF PROGRESS IN RELIGION

GEORGE H. BADGER, *Editor*

YOU have always taken it for granted, no doubt, that a religious magazine must necessarily be heavy, dull and uninteresting—though good!

Some religious magazines are just that. We aim to make THE UNITARIAN ADVANCE different.

We believe that Religion can be made the most interesting thing in the world,—if you have the right sort of religion: eager; up-to-date; virile; not a thing of cant, but a reality; not an echo of old-time dogma, but a live-wire of tingling progress.

CHIEFLY: are you not interested to have the world progress in reason, justice, truth and freedom: to have religion made human, rational, honest to the core, manfully invigorating, not thinly and softly sentimental, but stalwartly enthusiastic, kindling, and dramatic in modern zest of progress?

Well, that is what THE UNITARIAN ADVANCE is concerned with. Why not have a part in its enterprise?

One Dollar a year; three months for 25c.

THE UNITARIAN ADVANCE
104 East Twentieth Street
New York

THE TUDOR FACSIMILE TEXTS

Announcing Lippincott's New Spring Books

A REMARKABLE BOOK OF ROYAL REMINISCENCES

FROM MEMORY'S SHRINE

The Reminiscences of CARMEN SYLVA

H. M. QUEEN ELISABETH OF ROUMANIA

In a series of chapters that are neither memoirs nor yet character sketches of the usual kind, Carmen Sylva admits her readers to a shrine hitherto visited by herself alone. It is a sanctuary whose *lares domestici* are people, both of humble and of high estate, who left abiding impressions upon her mind when she was young, or who were the friends of later years. The book is written with touching sincerity and simplicity all through.

Photogravure Frontispiece and Eight Full-Page Illustrations. Decorated Cloth, Gilt Top, Uncut, $2.50 Net.

An Unknown People in an Unknown Land

By W. BARBROOKE GRUBB

With 60 Illustrations and a Map. Octavo. 330 Pages. Cloth, $3.50 Net.

Cliff Castles and Cave Dwellings of Europe

By S. BARING-GOULD, M.A.

With 10 Full-Page Illustrations. Octavo. 319 pages. Cloth. $3.50 Net.

Seventeen Years Among the Sea Dyaks of Borneo

By EDWIN H. GOMES, M.A.

A record of Intimate Association with the Natives of the Bornean Jungles. With 40 illustrations and a map. Octavo. 343 pages. Cloth, $3.50 net.

Among Indian Rajahs and Ryots

By SIR ANDREW H. L. FRASER, K.C.S.I.,
Ex-Lieutenant-Governor of the Province of Bengal.

With 34 Illustrations and a Map. 8vo. 168 Pages. Cloth, $4.00 Net.

Oriental Cairo

The City of the "Arabian Nights"

By DOUGLAS SLADEN

With 63 Intimate Pictures, and the Newest Map of Cairo. Large 8vo. 417 Pages. Cloth, $5.00 net.

A Short History of the United States Navy

By Captain GEORGE R. CLARK, U.S.N., and others

This history has been written to present a record of exactly what happened without personal, sectional, or national prejudice, and to regard naval events from the professional rather than the picturesque point of view.

With 16 Full-Page Illustrations and Many Pictures in the Text. Cloth, $3.00 net. *Ready in May.*

New Spring Novels

READY SHORTLY—THE HIT OF THE LONDON SPRING SEASON

PHRYNETTE

By MARTHE TROLY-CURTIN

Immediately on publication this refreshing novel took London by storm, and three large printings have already been required to meet the demand. It tells in a delightful way the impressions and experiences of a French miss of seventeen who goes to London to live. The author's style is brisk and snappy, there is irresistible humor in places, and a good solid love interest throughout. Colored Frontispiece by Frank Desch. 12mo. Decorated Cloth, $1.25 net.

FOURTH LARGE PRINTING

"ME—SMITH"

By CAROLINE LOCKHART.

"The strongest, most consistent story of the west which has appeared in years, and in many important points excels 'The Virginian,' its worthiest predecessor in the same field."
Chicago Daily News.

Five Illustrations. Cloth, $1.20 Net.

SECOND PRINTING

THE GOLD BAG

By CAROLYN WELLS

An 18-kt detective novel by the author of "The Clue."

Colored Frontispiece. Cloth, Picture Inlay, $1.20 net.

OUT OF RUSSIA

By CRITTENDEN MARRIOTT

A stirring novel by the author of "The Isle of Dead Ships."

Four Illustrations. Cloth, $1.25 Net.

EIGHTH LARGE EDITION—JUST ISSUED

ROUTLEDGE RIDES ALONE

By WILL LEVINGTON COMFORT

A year-old novel still gaining in sales and winning enthusiasm with the force and certainty of a classic. Decorated Cloth, $1.50.

NEW AND RECENT IMPORTANT BOOKS

France in the American Revolution

By JAMES BRECK PERKINS. An admirably written and authoritative account of the important part France played in the American Revolution. Ambassador Jusserand, who writes the introduction, says: "As for the work itself, it is so full of interest, the facts are so clearly put before the reader and with such conspicuous honesty and impartiality, that I cannot doubt of its success." $2.00 *net, postpaid* $2.15.

Palestine and Its Transformation

By ELLSWORTH HUNTINGTON. A scientific study of the geographical features of the Holy Land showing the important part changes of climate have played in fostering or retarding civilization. *Fully illustrated.* $2.00 *net. Postpaid* $2.15

John La Farge. A Memoir

By ROYAL CORTISSOZ. An intimate memoir and study of the great painter by a friend of twenty years' standing, largely based upon notes and recollections given to the author by La Farge himself. *Illustrated.* $4.00 *net. Postpaid* $4.15

The Life of Harriet Beecher Stowe

By HER SON AND GRANDSON. An absorbing centenary biography of one of the greatest American women. It combines the solid value of history with the fascination of fiction. *Illustrated.* $1.50 *net. Postpaid* $1.62.

The World of Dreams

By HAVELOCK ELLIS. This scholarly, instructive, and yet entertaining book discusses the peculiarities and curiosities of the world of dreams which everybody has wondered at. $2.00 *net. Postpaid* $2.12.

Across South America

By HIRAM BINGHAM. An interesting account of a trip from Buenos Ayres to Lima by train and mule-back, with information regarding the topography, institutions, political situation, and trade possibilities of South America. With numerous illustrations. $3.50 *net. Postpaid,* $3.71.

The Ideal Italian Tour

By HENRY JAMES FORMAN. A delightful companion and guide for the prospective traveller to this fascinating country. By the author of "In the Footprints of Heine." *Illustrated. Pocket size, leather binding.* $1.50 *net. Postpaid* $1.56.

A Year in a Coal Mine

By JOSEPH HUSBAND. A timely volume, being the actual experiences of a college graduate studying the conditions of a coal-mine in Illinois. Mr. Husband was a witness of strikes, fires, explosions, and numerous other interesting events. *With portrait.* $1.10 *net. Postpaid* $1.18

The Winter Queen

By MARIE HAY. "In reading this pathetic and tragic life of Elizabeth, granddaughter of Mary of Scots, and Queen of Bohemia for a winter, we not only find a sort of epitome of all the Stu-arts, but a modern woman who lives and suffers, fascinates, and sacrifices . . . The author has put far more life, audacity, and truth into these people dug out of dusty archives than is to be found in many of the best of modern novels."—*Gertrude Atherton in North American Review.* *Illustrated,* $4.00 *net. Postpaid,* $4.20.

By T. J. LAWRENCE,
Late Lecturer on International Law at the Royal Naval War College; sometime Professor in the University of Chicago.
The fourth edition of this authoritative work, revised and rewritten, is now ready.
Cloth. 750 pages. $3.00.
D. C. HEATH & CO., Publishers,
BOSTON, NEW YORK, CHICAGO.

BOOKS—All ont of print books supplied, no matter on what subject; write me, stating books wanted; I can get you any book ever published; when in England, call and inspect my stock of 50,000 rare books. BAKER'S GREAT BOOKSHOP, John Bright St., Birmingham, England.

The
Spring Educational Number
of
The Nation
will be published May 11th

SOME WORTH WHILE SPRING BOOKS

NEVIN O. WINTER'S *account of*

Argentina and Her People of To-day

In the Series of the Latin American Republics Uniform with "Mexico and Her People of To-day," etc.

A distinctly readable account and adequate description of a country and people not well known to the majority of readers. *Illustrated, in a box,* $3.00.

Old Country Inns of England

By **Henry P. Maskell** and **Edward W. Gregory**

"One cordially recommends 'Old Country Inns of England.' The book abounds in odd and quaint details and anecdotes. The style is direct, unaffected and not impeded by mere verbiage."—*Chicago Inter-Ocean.*

Cloth, Illustrated, in a box, $3.00.

JANE FELTON SAMPSON'S

Abroad with the Fletchers

A bright and chatty volume of travel through sunny Italy, picturesque Switzerland, quaint Holland and Germany, etc., etc. Well illustrated from photographs taken by the author.

Cloth, 12mo, Boxed; net $1.60.

CHARLES LIVINGSTON BULL'S

fascinating animal book

Under the Roof of the Jungle

"A detailed and remarkable account of the wild jungle region and its strange inhabitants. With sixty full-page plates, in color and black and white, from drawings done on the spot by the author."—*Boston Herald.* *Cloth 12mo. Decorative jacket, net* $2.00.

A Soldier of Valley Forge

By **Robert Neilson Stephens,** author of "*An Enemy of the King,*" "*Philip Winwood,*" *etc.*, and **G. E. Theodore Roberts,** author of "*A Captain of Raleigh's,*" "*A Cavalier of Virginia,*" *etc.*

A stirring romance of the Revolution, spirited and entertaining. With frontispiece in color by FRANK T. MERRIL. *Decorative jacket,* $1.50.

G. E. THEODORE ROBERTS'S *new novel*

A Captain of Raleigh's

"A typical Roberts romance—dashing and brisk. A capital yarn." *Cloth, 12mo. Illustrated, decorative jacket, net* $1.25.

From Page's List

Published by **L. C. PAGE & COMPANY** 53 BEACON ST. BOSTON

William Lloyd Garrison

The Story of his Life, told by his Children. Illustrated with over 40 portraits, views, etc. 4 vols., 8vo, gilt top, $8.00 *net.*

"A masterpiece of modern historical biography. . . . To call the work a mine of information would be to convey a false impression; it is rather a well-arranged library in which attendant hands are always present to point the way to the exact thing wanted. . . . Finally, the work, while as instructive as the driest manual, is as interesting as a romance."—*Boston Advertiser.*

"It is, for the anti-slavery record, final; and the service done to our national history is as great as that to a father's memory. Its one eminent trait, however, is its justice."—*Atlantic Monthly.*

"In fact, Southern history is not complete without this work."—*Atlanta Constitution.*

****For sale by booksellers. Sent, postpaid, on receipt of price by the publishers.*

HOUGHTON MIFFLIN COMPANY

BOSTON AND NEW YORK

FOODS AND THEIR ADULTERATIONS

The Origin, Manufacture and Composition of Food Products, Detection of Common Adulterations. Food Standards.

By HARVEY W. WILEY, M.D. { *Chief Chemist, U. S. Department of Agriculture, Washington, D.C.*

There is no other man better qualified to write on the subject or who has had the extensive experience of Dr. Wiley.

Second Edition. 11 Colored Plates and 87 Other Illustrations. Octavo; 641 pages. Cloth, 4.00 net.

Synopsis of Contents—*Introduction.—Meats.—Poultry and Game Birds.—Fish Foods.—Milk and Milk Products.—Cereal Foods.—Infants' and Invalids' Foods.—Vegetables, Fruits, Spices, Nuts, etc.—Sugar and Honey.—Detection of Common Adulterations.—Food Standards.—Index.*

Orders may be sent to any bookseller; or upon receipt of price we will forward to any address, postage or express charges prepaid. The book will be found on sale at The Baker & Taylor Co., 33 East 17th Street; Wm. R. Jenkins Co., 851 Sixth Avenue; G. E. Stechert & Co., 151 West 25th Street, and G. P. Putnam's Sons, 2, 4 and 6 West 45th Street, New York.

P. BLAKISTON'S SON & CO., Publishers, 1012 Walnut St. PHILADELPHIA

THE INTEREST OF AMERICA IN INTERNATIONAL CONDITIONS

ADMIRAL A. T. MAHAN'S new book.

$1.50 net; postpaid, $1.60.

LITTLE, BROWN & COMPANY, Publishers, BOSTON

LIBRARY RESEARCH

Researches made in Boston and Harvard Libraries. Ancient and modern languages. Translation, revision of manuscripts, etc.

MISS M. H. BUCKINGHAM,
96 Chestnut Street, Boston, Mass.

"A REMARKABLE BOOK."

China under the Empress Dowager

With 30 illustrations and a map. Large 8vo. Cloth, gilt top, $4.00 net.

J. B. LIPPINCOTT CO., Philadelphia

Among Important New Macmillan Books

NEW NOVELS — *NOW READY*

Gustav Frenssen's — Klaus Hinrich Baas — *Cloth, $1.50*
There is wonderful vigor and sincerity in these pages; as the *Boston Transcript* says: "we who read see the struggle and feel the strength of the man growing."

Mrs. Roger A. Pryor's — The Colonel's Story — *$1.20 net; by mail $1.30*
"It has a charm peculiar to its Virginian setting, but it has also the charms of humor and tenderness."

Mrs. Hubert Barclay's — Trevor Lordship — *Decorated cloth, $1.20 net; by mail $1.30*
An unusual story full of charm for those who are sensitive to delicate shades of emotion and to the hidden beauties of life.

Richard W. Child's — Jim Hands — *Decorated cloth, $1.20 net; by mail $1.32*
One of the best of recent novels, strikingly original, full of that mixture of kindliness and humor which makes life worth living and fiction worth reading.

Jack London's — Adventure — *Decorated cloth, $1.50*
"Rapidly shifting exciting incidents, in scenes fascinatingly novel and vividly real, fill the novel with uncommon interest."

F. Marion Crawford's — Wandering Ghosts — *Cloth, $1.25 net; by mail $1.37*
There *is* something uncanny in the idea of adding to the long shelf of Mr. Crawford's novels *now* a book so creepily ghostly. But you will miss unique evidence of his literary power if you don't.

Hamilton Drummond's — The Justice of the King — *Colored frontispiece, $1.20 net; by mail $1.32*
"A tale of many sensations and much mystery, ending delightfully."—*Times.*

Charles G. D. Roberts's — Neighbors Unknown — *Illustrated. Cloth, $1.50*
"Few stories about animals have as strong a power to interest and entertain or carry as deep a conviction of their truth and reasonableness."—*Chicago Tribune.*

Josephine Daskam Bacon's — While Caroline Was Growing — *Illustrated. Cloth, $1.50*
Caroline has "none of the narrowness of a specialist," as Mr. Chesterton says of children who, like her, "ask all the questions that there are and some that there aren't."

OTHER NEW BOOKS OF VARIED INTEREST — *NOW READY*

E. R. A. Seligman's — The Income Tax — *Cloth, 8vo, $3.00 net; by mail $3.20*
"One of the greatest productions in the realm of public finance, this volume is worth the serious perusal of every student and every business man."—*United Banker.*

Mr. Henry Osborn Taylor's — The Medieval Mind — *In 2 8vo volumes, $5.00 net; carriage extra*
An illuminating presentation from original sources of emotional and intellectual life in the twelfth and thirteenth centuries. By the author of "Ancient Ideals."

Mrs. Alfred Ely's — The Practical Flower Garden — *Cloth, 8 plates in color and other illustrations. $2.00 net; by mail, $2.15*
By the author of "A Woman's Hardy Garden" and "Another Hardy Garden Book." Among the special charms of the volume are its chapters on caring for trees, shrubs, and lawns, and on the possibilities of "the wild garden."

The Life of Benvenuto Cellini — *Illus., two vols., $9.00 net; carriage extra*
A new complete unexpurgated edition of Cellini's memoirs by R. H. H. Cust, containing fine reproductions of his masterpieces.

The Letters of Richard Henry Lee — *Price of the volume now ready, $2.50 net*
A valuable series of letters, collected and edited by James Curtis Ballagh, Ph.D., LL.D., Associate Professor of American history in the Johns Hopkins University. Vol. I.

Dr. W. C. Bagley's — Craftsmanship in Teaching — *Cloth, $1.10 net; by mail $1.20*
By the Director of the School of Education, University of Illinois. Author of "The Educative Process," and "Classroom Management."

The Book of Love — Introduction by Madison Cawein — *Cloth, $1.25 net; limp leather, $1.75 net*
An addition to *The Friendly Library*, containing bits of the best literature concerned with life's greatest emotion.

Molly Elliot Seawell's — The Ladies' Battle — *Ready this week*
A contribution which is already arousing lively interest to the fight over "votes for women."

Published by THE MACMILLAN COMPANY 64-66 Fifth Ave. N. Y.

The Nation

NEW YORK, THURSDAY, APRIL 20, 1911.

The Week

Continuing their prompt and efficient carrying out of their legislative programme, the House Democrats have passed the bill providing for publicity of campaign expenditures. The only difference between it and the law now in force is that publication must be made before as well as after elections. This might seem an unimportant distinction if we did not remember how our greatest authority on political morals has treated the matter. In 1908, President Roosevelt severely rebuked Mr. Bryan for urging preëlection publicity of campaign contributions, showing how it would lend itself to all kinds of suspicion and malice. For example, if Harriman's large gift of money to Roosevelt in 1904 had been known in advance of the election, all kinds of wicked things would have been said, and some votes might have been affected. Consequently it would be all wrong to make public the accounts until after the election. However, by 1910 Mr. Roosevelt had discovered that publication before election was an essential part of the New Nationalism, and therefore a part of that immutable morality which existed before the world was made. If there were any doubt that it is a "progressive" doctrine, it would be removed by noting how Mr. Roosevelt has progressed with it.

The new phase of the Lorimer inquiry is rapidly getting far beyond the amusing stage in which Mr. Lorimer seemed to see it when the testimony of the general manager of the International Harvester Company brought it to the front a week or two ago. Mr. Funk's assertion that Hines had asked him to contribute $10,000 for his company toward reimbursing those who had advanced the sum of $100,000 to procure Lorimer's election is receiving corroboration at the hands of several other witnesses or affiants in the legislative investigation going on at Springfield. "I have just had a telephone call from Springfield and I have elected our next Senator" is what one witness says Hines told him on the day of Lorimer's election. Of course, Hines may have meant merely that his argumentative powers or his gifts of persuasion had brought the Democratic legislators around to voting to send the Republican politician to the Senate; but it must be remembered that this pleasing explanation, besides lacking somewhat in inherent probability, requires us also to suppose that Mr. Funk wantonly committed perjury when he swore that Hines had asked him for the $10,000. And then there are the affidavits of two other persons, both declaring that Hines had told them of having spent a large sum of money to procure the election of Lorimer. "We put Lorimer over," said Hines, according to one of these affidavits, "and it cost us a lot of money, but it is well worth all of it to us." The other expressly mentions $100,000 as the amount, the same as that named by Kohlsaat and Funk. In view of all this, it would hardly be regarded as over-sensitiveness on Lorimer's part if he were now to take serious notice of the matter.

Ambassador Hill's letter of resignation has the air of being entirely voluntary yet withal forced. That is to say, he distinctly left a "string" attached to it, which President Taft, however, saw fit to ignore, acquiescing cheerfully in Mr. Hill's desire to give up his post at Berlin. Under the circumstances, therefore, it is inevitable that there should be a suspicion that friction had developed between the Ambassador and the State Department in connection with the potash controversy with Germany, or that there had been dissatisfaction with Mr. Hill on some other ground. Berlin dispatches state that the resignation of the American Ambassador created no surprise there, though it is admitted that, despite the little flurry at the time of his appointment, he had won a distinct success, diplomatically if not socially. No one has ever questioned Mr. Hill's ability or his fitness for a diplomatic career, for which, indeed, his special studies had well equipped him. The retirement of such a man puts a double obligation upon the President to see to it that the Ambassador's successor at Berlin should be one in every way qualified for a position increasingly important.

Close upon the heels of Mr. Bryan's refusal of an offer of $2,000,000 to go and live in Memphis comes a letter from the Omaha Commercial Club, offering to let Memphis have Mayor "Jim" Dahlmann for $1,500,000. There must be many cities, towns, and villages in the United States who could be induced to part with their superfluous statesmen if Memphis really means business. San Francisco would probably take $1,000,000 for Mayor McCarthy, with 30 per cent. off for cash. Albany would probably accept $750,000 for William Barnes, jr., or might consent to a trade, taking two-thirds cash and the rest in Tennessee bosslets and wire-pullers. Washington would gladly let William E. Lorimer go to Memphis at a nominal price and on a very liberal instalment plan. We need only touch, of course, upon the possibilities connected with the persons of Mr. Charles F. Murphy and Mr. George B. Cox, whom their respective communities could afford to let Memphis have with a million-dollar premium thrown in, and still make money.

Senator Cummins's resolution that the Monetary Commission be instructed to report to Congress on December 4, and that it then be dissolved, should be considered from several different points of view. The work of two members of the Commission—its chairman, Senator Aldrich, and its vice-chairman, Representative Vreeland—has been of very great value. Their individual labors have removed the question of currency reform from the sphere of vague and uncertain controversy, with no practical drift whatever, to discussion of a series of concrete propositions on which opinion may be clearly lined up and the general merits of the problem profitably discussed. This, we are confident, will be admitted even by those who differ with Mr. Aldrich and Mr. Vreeland on specific contentions. In particular, it must be said of Senator Aldrich's draft of a plan for reorganization of the banking system, published on January 16, that it brought the discussion to a stage where definite shaping of public opinion was more possible than in the case of any previous proposal of the sort. We believe that no commission for further consideration of the question could

properly be formed without including both Mr. Aldrich and Mr. Vreeland in its membership.

But of the Monetary Commission as a whole it is impossible to say as much. The Commission has been in existence since the early months of 1908; in the three subsequent years it has done nothing whatever as a body. Not only has it made no report, but it has held no meetings except of the most perfunctory character. Leaving out the chairman and vice-chairman, nobody knows what the individual opinions of its members are; they have, in fact, taken no interest in the matter. Since the Commission was appointed for a definite purpose and with definite instructions, and since its members are paid by the Government for their work, we do not see how any one can criticise Senator Cummins's resolution as unreasonable. It would be manifestly absurd to continue indefinitely the terms of commissioners who were doing nothing. We think, however, that it would be far more satisfactory to the business community if the call for a final report and the notice of the Commission's dissolution were to be coupled with some more definite declaration of what Congress proposes to do next in the matter. It is possible that Congress might take such measure or measures as the Commission should submit to it, refer the bills to tho appropriate committee, and have them reported for the serious consideration of the winter session. But the people would like to have some definite intimation of the programme.

President Mellen's appeal to Bostonians to build up their port before New London and Montauk are utilized as transatlantic terminals ought not to fall upon deaf ears. They were not, he said, so learned in graft as New Yorkers nor so exalted in spirit as to believe that business would come to them no matter what exactions might be imposed; but otherwise, he intimated, they were in a situation to compete readily with New York, if only because a steamship could arrive in Boston and its passengers be disembarked there and taken by rail to this city before another steamship could reach a New York dock. Moreover, he assured the Bostonians that the necessary railway facilities were already supplied. What Boston ought to do is to build a great drydock, and piers long enough to accommodate the new ships toward which New York has been so offish. There is truth in all that Mr. Mellen says, and still more in the fact that, whether it be due to the paralyzing effect of the protective tariff, with its rewards to manufacturers, or to dry-rot and invincible business conservatism, Boston lags sadly. Mayor Fitzgerald recently complained that all of Boston's financial district was controlled by about six men, "silk-stockinged bankers" he called them, more interested in putting New England money into Western railways, Southern mills, and distant enterprises than in developing Boston's resources. Complaints about the apathy of its Chamber of Commerce reach us constantly; an industrial revivalist and leader is plainly what the hour calls for.

The Philadelphia *Bulletin* generously points out to the Republican organization of that city how it can elect the next Mayor "without the slightest trouble, without any expensive campaign, and without any disturbance whatever of the public temper." All this it may do "if it shall simply provide the voters with a candidate whom they will support willingly," that is, "self-respectingly." The *Bulletin's* innocent idea of politics, however, is revealed by its declaration that the Mayor ought to be elected without any regard to his opinions on national political questions, and solely by virtue of his ability to administer the government of the municipality in the interest of the people. Senator Vare's words have the right sound. Being ignorant of what "the leaders" are going to do with reference to amending the charter so as to allow Mayor Reyburn to run again, he thinks the matter ought to be decided according to the state of public opinion. "It ought to be just as the people say." And as soon as he is sure of just how much the people will stand, Mayor Reyburn and the rest will have the answer to the Mayoralty puzzle.

The final report of the Chicago Municipal Efficiency Commission justifies that body's title. Hitherto the Civil Service Commission of the city has been severely hampered by the grading of the service according to compensation. The Efficiency Commission has worked out a system of grading according to the character and value of the services supposed to be performed. This arrangement makes possible a readjustment of salaries under a classification of employment that is uniform or parallel for all departments. Duties are definitely set forth, standards of efficiency are established by which employees may be rated, and the way is opened for their promotion upon a proper basis. In order to insure permanency to this standardization, it is recommended that the efficiency division of the Civil Service Bureau be maintained and authorized to continue and to broaden the work which it has been doing in coöperation with the Efficiency Commission. Further suggestions of improvement are the installation of a central accounting system, getting rid of duplication of work, and investigation into the compensation of the employees of other municipalities and of private enterprises. Chicago now has a very definite opportunity of making and keeping her public service highly effective.

In view of the sudden increase in lynchings in the South, we take pleasure in calling attention to the excellent stand of Gov. O'Neal of Alabama in connection with the killing by a mob of Aberdeen Johnson, accused and probably guilty of criminal assault. To the press Gov. O'Neal has said:

> The more I hear about the Union Springs affair the more disgusted I become. The idea of a sheriff being kidnapped in broad daylight does not appeal to me. The whole thing appears fishy. This is the first lynching of a prisoner since my inauguration as Governor of Alabama, and I will use every means at my command to make it the last. The people of Alabama may as well understand right now that such acts will not be tolerated while I am Governor. Every prisoner, no matter what his color, is entitled to the protection of the law, and I propose to see that officials under my command do their duty or suffer the consequences. Steps will be taken at once to impeach the sheriff of Bullock County.

This has exactly the right ring, and will do a world of good. Indeed, the sheriff of Bullock County is already cringing and whining.

What could be clearer proof of the national character of our game of baseball than the fact that the opening of the season is now marked by all due official ceremonial? In Washington last week the President of the United States, attended by secretaries and Cabinet

Ministers, formally proceeded to the grounds and threw the first baseball into the diamond; while in New York a hard-working Mayor left his office to perform a similar function at the local grounds. Mr. Taft, we are also told, showed how familiar he was with the spirit of the game by nodding his head in vigorous approval of the assertion that Boston's unearned runs were "highway robbery." This official encouragement and supervision of our national sport bring up interesting visions of what the future relations of our government to it will be. The Sherman Anti-Trust law gives, we take it, sufficient guarantee that no magnates will ever be allowed to conspire to restrain the baseball trade by forming a Trust. The Bureau of Corporations, too, will keep an eye on the owners. But will there not soon have to be, in addition to the proposed child's bureau, a separate baseball bureau allied to it and under the Department of Commerce? A strong argument for the proposed change in the date of our President's inauguration is furnished by the fact that if it were on the twelfth of April, the opening baseball game could be part of the inaugural ceremonies. The players could march from the Capitol to the White House at the head of the military parade and just before the Cabinet, and the afternoon could be devoted to watching the game.

While Francisco Madero may justly be regarded as the head and front of the Mexican revolution, and probably has it in his power to make terms with the Diaz government according to his own judgment, there is one revolutionary element that does not share the Maderist programme, though coöperating for the time against Diaz. This element comprises the small body of men who have been conducting operations across the border from Mexicali, and who, under the leadership of Stanley Williams, suffered a severe repulse at the hands of the Federals only a few days ago. Concerning this small band, rumors have been circulated crediting them with the intention of establishing an independent Socialist republic in Lower California. Their real aim, however, seems to be the enforcement of a more democratic scheme of reforms than Francisco Madero is likely to exact. From their point of view, Madero is a member of the same ruling caste as Diaz. He stands for the abolition of the dictatorship and a moderate liberalizing of institutions, but his advent is likely to bring little relief to the great masses of the Mexican people who, at present, live under an impossible political and agrarian régime. It is a problem, of course, which exists in every one of the Latin-American republics.

Lord Rosebery, in his position of splendid isolation, politically, continues to play the rôle of candid friend in a way to make the Conservatives pray, with all of Canning's fervor, to be saved from him. In his latest speech in the House of Lords he threw whole buckets of cold water on the proposals of Lord Lansdowne. That Conservative leader had himself politely bowed the referendum bill out of the door, yet dwelt with great earnestness upon his plan to reform the House of Lords. But this last was received by Lord Rosebery with something like contumely. He declared that he had "always been stoutly opposed to a great proposition for Constitutional reform emanating from any private member, however distinguished he may be." This "always," to be sure, looks very like sudden forgetfulness of Rosebery's own scheme last year, when he was a private member; but he went on cruelly:

> What is the use of bringing forward a measure which you know that by no possibility can you carry into law? It may have strategical advantages—of those I am no judge. But I believe it to be a great mistake to launch a scheme of this kind, however perfect it may be, which you cannot carry into effect until you are seated on the Government benches, and which, therefore, is only in the nature of an air-balloon, floating, perhaps, from this House, but which certainly will come to the usual aeronautical calamity in the other.

The rest of the noble lord's speech was devoted to a general scolding of both parties. It is generally admitted, however, that his scorn of Lansdowne's proposal has settled its business for the present session.

The world is so accustomed to thinking of Germany's universities counting their age by centuries, and so used to believing there are too many German universities anyhow, that the announcement of the opening in 1914 of a new one at Frankfort-on-the-Main will cause some surprise. The general Government will have no part in this project, the entire sum necessary, including an endowment of $2,875,000, having been raised by private subscription or contributed by the municipality. Neither Baden nor the Empire will contribute a cent, and the local founders announce as one of the attractions of the new institution that it will be "free from all crippling customs and traditions of long past ages." Thus has modernism invaded the college world, even in conservative Germany. In a sense, it is, however, not a new departure. The backbone of the university is to be the numerous art and medical schools, the clinics, the Chemical Institute, the Academy of Social and Commercial Sciences, etc. To these will be added the municipal library and the great Dr. Sneckenberg library. All the usual branches of university teaching will be represented in the faculty, except theology. Finally, there are to be special post-graduate courses for graduates already in practical life and special extension studies for non-graduates, even though they be well on in years. This last is in itself a good deal of an innovation for Germany.

Prier's extraordinary flight from London to Paris, a distance estimated at 290 miles, in four hours and eight minutes, is truly sensational. It bears out those aviators who have said that we have not yet begun to realize the possible development of the aeroplane. In Europe the 1911 flight-season is well under way and the universal interest and incessant experimenting are in marked contrast to the comparative indifference on this side. A dirigible balloon over Berlin by night or day is no longer a novelty. The new Siemens dirigible, of which so much is expected, has already made a dozen trips, and there are two new military airships in constant use. Count Zeppelin's new air-craft, the Deutschland II, is actually in service at Düsseldorf, with a capacity of sixty passengers. Moreover, its commercial flights are under the control of the progressive government of that city, which is liberally subsidizing them. Plainly, the Germans are going into this field with Teutonic thoroughness and true scientific devotion, while the United States lags—there is not a single dirigible in this country. Even in India they have inaugurated a regular aeroplane postal service.

FEDERAL CONTROL OF SENATORIAL ELECTIONS.

There was some good debating in the House on Thursday of last week, when the amendment of the Constitution was passed to make the election of Senators direct. Despite the usual amount of talking at cross-purposes and for party advantage, several speeches were very much to the point—and there was, of course, only one point actually in dispute. Virtually all of the Representatives were for the popular election of Senators, but many of them scented danger in giving up the present power of Congress to "make or alter" the regulations prescribed by the State Legislatures respecting the "times and manner of holding elections for Senators." The proposed amendment reads: "The times, places, and manner of holding elections for Senators shall be as prescribed in each State by the Legislature thereof." On that difference the whole discussion really hinged.

Opponents of the change were forced to admit that the existing authority of Congress over Senatorial elections had never, in fact, been exercised. That, however, is not a conclusive argument for abolishing it. As Mr. McCall put the case: "No matter if it has been a sleeping power up to this time, it may some time be a power that is vital." Although he was ready to have Senators elected just as Representatives are, and thought that it would be better all round to have them so chosen rather than by the Legislatures, he felt so strongly that the "supervisory power" of the National Government ought not to be taken away that he could not vote for the amendment as it stood. Another serious and able Republican member, Mr. Foster of Vermont, took a somewhat different view. He was personally very desirous that Congress should retain its present power. But he did not believe that its omission would be fatal. Mr. Foster brought up the analogous case of Presidential electors. The Constitution leaves to the Legislatures of the States to determine how they shall be elected. "For more than a hundred years, under this provision, the electors have been chosen by the people. The results have been satisfactory. If the States can be trusted in all matters relating to the election of Presidential electors, they can surely be trusted in all matters relating to the election of United States Senators."

What seems to us the most effective speech in the debate yet printed in the *Congressional Record* was made by Mr. Cooper of Wisconsin. A lawyer, a member of the House of long standing, a Republican who is strongly against discrimination between classes of voters or disfranchisement of any, his words have much significance and weight. Mr. Cooper, too, would prefer to have the reserved power of Congress retained, but was nevertheless "unable to see such possible harm to come as has been talked about so frequently," in case it were dropped. He argued that there was a deposit of power in Congress made elsewhere in the Constitution, sufficient to cover what was really desired. The fear has been that if the "manner" of electing Senators should be left entirely to State Legislatures, discrimination would be practised. This apprehension has been peculiarly strong in connection with the Southern States. There the disfranchisement of negro voters has gone on for a long time, and the dread is that it may gain a new color of law, or at least an added immunity from legal attack, by dropping from the Constitution the right of Congress to supervise the "manner" of electing Senators, as well as Representatives.

On this point it is to be said that the Constitutional proviso in question has never been invoked nor so much as thought of as the true bulwark against negro disfranchisement. Far from regulating the "manner" of electing Senators in the Southern States, Congress has sat by and seen them one after another adopt the "manner" of a Senatorial primary, thus in effect nullifying the intent of the Constitution that Senators should be elected by a deliberating Legislature. And as for the qualifications of voters for Senators, under the method of direct election, the case is this. Under the proposed amendment, "the electors shall have the qualifications requisite for electors of the most numerous branch of the State Legislature." That is to say, the right to vote is not a Federal right, but a State right. Under the Constitution, each State has always had the sole power to prescribe the qualifications of the voter. Only, the Federal Constitution undertakes to provide that there shall be no unfair or discriminating application of the State rules for voting. The Fifteenth Amendment forbids any State to deny or abridge the right of a citizen to vote on account of race or color, and Representative Cooper maintained that this fundamental guarantee would remain unimpaired by the proposed amendment, and would be ample to prevent any of the political evils feared. "If any State should pass a law declaring that white citizens could vote for United States Senators but that colored citizens could not, the Supreme Court would pronounce such a law unconstitutional." For this reason, Mr. Cooper, "a Republican born and bred, coming from among a people who conducted stations of the underground railroad to help men and women to liberty," was prepared to vote for the amendment even in a form which he did not like, since under it he did "not believe that the rights of any citizen would be jeopardized."

While such expressions by such Republicans are by no means conclusive, they are reassuring. Congress has certainly at present more power over elections than it uses; the question is if it will not have enough after the new amendment has passed. On that point it is for Constitutional lawyers to speak; and the Judiciary Committee of the Senate could do the country no better service than to make a full report setting forth in detail the Constitutional bearings of the amendment as proposed, and showing also what kindred powers Congress will continue to possess even if the "sleeping power" of controlling Senatorial elections is abandoned.

ARBITRATION AND "REALITIES."

For the very cool reception which the German Chancellor gave to the project of international arbitration, he has received a good deal of praise. Here was a statesman, if not of blood and iron, at least with a firm grasp on the rough realities. Herr Bethmann-Hollweg was a man with no moonshine about him. He was able to sweep away the sentimental cobwebs from the hard fact. Some of his compatriots hailed him as a *Realpolitiker*. Germany could not go far wrong under the guidance of a Chancellor who saw things in the dry light of reason and exactly as they are.

It at once appeared, however, that the clear-visioned statesman had overlooked

something. In his contempt for dreaming, he had forgotten the millions of dreams in his own country and in other lands. They are intensely "real," whatever may be said of their visions of peace, and no man can be truly a *Realpolitiker* who leaves them out of his reckoning. This was immediately discovered by the Kaiser, if not by the Chancellor. William II became aware of the bad impression made by Bethmann-Hollweg's cavalier remarks, and hastened to give an interview explaining that it was not to be understood that Germany desired to hold herself entirely aloof from the discussion of disarmament or of the peaceful settlement of international disputes. That could only mean that the Emperor perceived a stern reality which his Chancellor had seemed to ignore—the unescapable truth, that is to say, of a growing humane sentiment and a rising demand that war shall be thought of only as a last desperate resort. This idea has recently been expressed by Sir Oliver Lodge, with the serene detachment of a scientist, in the following language: "In cold blood, and in the light of sanity and reason, the settling of disputes by means of bodily violence is manifestly uncivilized and barbarous."

Now, in such a conviction, once it is clear and pervasive, we have something as "real" as anything can be in this world. It is among what Machiavelli called the "effectual verities," which any statesman will neglect at his peril. Grant the existence of a definite and continually heightening sentiment against the atrocities of war, and you have a reality as unquestionable as guns or armor-plate. A higher emotion is as truly a fact as is a cannon-ball. There is, indeed, a psychology of the attitude toward war which has already profoundly modified the laws of war and which is certain more and more to make itself felt. War was once synonymous with pillage. But little by little the humane feeling of mankind has laid a compulsion upon combatants, until now, in land warfare at least, they respect private property. The movement is slowly extending to war at sea. The Declaration of Paris made a beginning, and now the Declaration of London, which is pressing for ratification by the naval Powers, goes much further and virtually exempts private property on the ocean from capture or destruction by belligerents. Unreal and despised "sentiment" has wrought that great transformation. Mitigation of the ferocities of war has been looked upon by some lovers of peace as undesirable, on the ground that the more savage you can make war appear, the more powerful will be the motive of civilized nations to avoid it. John Stuart Mill once expressed this view, though he lived to retract it, as John Morley recently pointed out. The difficulty with that position, too, is that it fails to take into account the actual feelings of men and the whole course of humane evolution. It has been justly said that it is impossible to think that "nations should *plan* to evolve themselves into a state of permanent peace by making war as savagely as possible." And it is obviously true that the removal of one barbarity after another from war will make men—simply because they are less barbarous—not more but less ready to go to war. Such are some of the realities of sentiment, deep-seated in the mystic frame of man, which are more powerful than regiments or fleets.

But if our intensely practical and hard-headed statesmen must have something which even they will admit to be "real," let them take up the question of money spent on armaments. Gold and silver are realities, surely; national treasure is undoubtedly actual. Well, in 1908 the eight leading nations of the world spent upon their armies and navies, in time of peace, no less than $1,320,000,000. For their citizens this meant a tax, in some cases, of more than $5 per capita. This crushing and increasing outlay on the mere preparation for war is so "real" a thing that the English Foreign Minister has lately called it the most appalling fact which confronts modern statesmanship. And Sir Edward Grey added that if this mounting expense were not somehow checked, there would soon be a prospect, not of foreign wars, but of internal revolutions. And how do our great realists among public men, who scoff at the possibility of making an end of war by treaties or universal arbitration—how do they meet this argument from the intolerable burden of taxation for war in time of peace? Why, they do it by a process of reasoning so self-contradictory, so fantastic, that it deserves to be known as one of the least "real" things ever heard of. It was satirically stated, and yet with almost literal truth, by an English member of Parliament, Mr. J. M. Robertson. This is the way in which he gives the logic of the militarist *Realpolitiker:*

(1.) Wars are inevitable.
(2.) If you repine at the cost of armaments, remember that large expenditure on these is the way to prevent war.
(3.) Ergo, by spending money enough to prepare for inevitable wars, you avert war altogether.
(4.) So we must conclude that war is inevitable.

SANCTA SIMPLICITAS.

Those who are oppressed with the fear that the world is getting too sophisticated must often be encouraged when they follow a popular economic controversy. The struggle between protection and free trade is, in itself, a perfect storehouse of good cheer for any one who believes that in preserving simplicity of mind lies the safety of the race. John Stuart Mill, in that chapter of his "System of Logic" which dealt with the dialectic of the moral sciences, spoke of the remarkable way in which the crudest errors of reasoning persisted in this domain, in spite of the wonderful progress that had been made in the domain of physical science; and, though the two generations which have since gone by have far surpassed all preceding epochs in the abundance and pervasiveness of the achievements of the sciences of external nature, in all that relates to man's immediate interests what Mill said sixty or seventy years ago he would have to say to-day.

Just what the committee of the English Board of Trade has said about American wages and cost of living, and just what the English press is saying about its report, cannot be known with accuracy from the cable dispatches; but enough is contained in these to show that the reception of the report has furnished as delightful an illustration as could possibly be desired of intellectual simplicity. It appears that the report finds American wages in the pursuits reported on to be 130 per cent. higher than English, while cost of food and rent here is only 52 per cent. higher than in England and Wales; whereupon the British protectionist press breaks out into pæans of triumph, while the free-trade press tries to break the force of the figures by elaborate counter considerations. "The report means a

death blow to free trade," says the London *Express;* American conditions of life, declares the *Morning Post*, "are very much better than those actually enjoyed by the people of England or than they are likely to obtain as long as they are held in the fetters of free trade." On the other hand, the free-trade *Daily News* says that the committee's figures on American rents and prices are far below the facts, that factory legislation here is behind that in England, and that as a matter of fact "the mass of American town workers are not even superficially well off, their condition being at least as melancholy as anything the United Kingdom can show."

Now what must strike the sophisticated man—the man who has got beyond the stage of the totem and the fetich in his methods of thinking about human affairs—is that the figures in the case, whether correct or not, cannot, at the utmost, furnish anything more than a faint hint as to what England might expect from the abandonment of free trade and the substitution of protection in its stead. In the first place, the question whether the well-being of the American wage-earner has been caused in any degree—and if so, to what degree—by the policy of protection, would have to be considered; English economists who *are* economists have cheerfully admitted that Americans in general, and American workmen in particular, are more prosperous than English, but they have unhesitatingly contended that the difference in their favor would be still greater if the burden of protection were removed. But even if it were to be granted for argument's sake that it is protection that keeps American wages high, would it follow that protection would make English wages high? Even if the American protectionists' high-wages argument were not tainted with fallacy, that argument would turn to ashes in the mouth of the English protectionist. For the American high-tariff man says that protection is needed by the American workingman against the lower wages—"the pauper labor"—of other countries, and there is some sense in this, at least on the surface; but if the English protectionist were to attempt the same argument, he would have to begin by admitting that wages in the protectionist countries of Europe are lower than those in free-trade England—and then what becomes of the case he had built up on the figures of the Board of Trade?

The argument that because America with protection has higher wages than England with free trade, therefore protection would raise English wages, is on an intellectual level with that which forms the stock-in-trade of the vender of patent medical nostrums. Indeed it is on a distinctly lower level; for the "testimonials" which the patent medicine company deals out do make an attempt to describe conditions and symptoms, and count on only so much gullibility as is involved in supposing that if your symptoms seem like the other man's, the alleged efficacy of the medicine in his case would be repeated in your own. In the protection matter, on the other hand, not only is the miracle-working quality of the nostrum assumed to have been demonstrated in the American case by the mere fact that the American is well off, but no attempt is made even to pretend that the two cases are at all alike. A country twenty times as densely inhabited, an ancient country with its natural resources completely explored long ago, a country with an inheritance of feudal conditions, is placed alongside our country of boundless new opportunities, and if a difference is found to our advantage it is incontinently set down to the tariff. For sheer fatuity, we can think of nothing quite worthy to match this outside the immortal report of the Brick Lane Branch of the United Grand Junction Temperance Association, on the case of Thomas Burton:

> Has a wooden leg; finds a wooden leg expensive, going over the stones; used to wear second-hand wooden legs, and drink a glass of hot gin-and-water regularly every night—sometimes two (deep sighs). Found the second-hand wooden legs split and rot very quickly; is firmly persuaded that their constitution was undermined by the gin-and-water (prolonged cheering). Buys new wooden legs now, and drinks nothing but water and weak tea. The new legs last twice as long as the others used to do, and he attributes this solely to his temperate habits (triumphant cheers).

THE GOVERNMENT OF UNIVERSITIES.

Americans interested in the questions of university government will find much that is interesting and pertinent to our own situation in the admirable article on "Modern Universities and their Government" which is the leading feature of the London *Times's* educational supplement for April 4. We are very much in the habit of thinking of our universities, with ultimate power over the institution resting in their lay boards of trustees, as being in this respect quite unlike any other educational institutions of similar importance; and this is natural enough, since the half-dozen new universities that have been established in the chief provincial cities of England, and which are probably their only important analogues, are of such recent origin as to be seldom prominently in our thoughts in this connection. It is the government of these new universities, and especially the methods and the spirit of their procedure in the appointment of professors, that constitute the subject of the *Times* article; a subject justifying the extreme seriousness with which it is discussed, because the universities in question are expanding with such rapidity that they "have to a large extent the future of English learning in their hands."

Both the resemblances and the differences that suggest themselves, between the American and the English experience, are of decided interest. Into the details of the English organization we shall not attempt to enter; suffice it to say that the active governing authority of the university, corresponding to our board of trustees, is what is known as the Council; and while this Council is not nominally self-electing or self-renewing, in practice it is so. Perhaps the most interesting statement made about the Councils is that which refers to the personal attitude of the members who constituted those bodies in the first place, and to the signs of a change which seems to be more or less in danger of showing itself as matters settle down to a more mechanical routine. The large prospect of creative utility which the foundation of the provincial universities opened up attracted the services in their Councils of some of the ablest business men in England, who felt that they were privileged to take part in the building of great institutions of national importance. "And, being large-minded men," says the *Times* writer, "they have usually recognized the limits of their own competence, and know what matters to leave in the hands of the experts. They have respected and trusted the scholars by whose presence their cities were enriched." In some of the successors of these large-minded men, a tendency has been observed to depart from this fine

attitude. "The smaller man is apt to have less respect for and less trust in the scholar than the bigger man, and a more serene confidence in his own capacity as a 'business man' to deal wisely with any and every question that may come before him."

Speaking broadly, it is safe to say that while our boards of trustees have furnished illustrations of both of these types of attitude and conduct, neither their merits nor their defects have been so pronounced as the *Times* article represents the case to be in England. Many trustees of American universities, however, have done a great amount of important and unselfish service, animated by that same feeling of the honor and the usefulness of their posts that obtained with the able men who helped to build up the new English universities; while, on the other hand, the instances of pretentious or ignorant meddling by trustees have been very rare in this country, in the case of universities of high standing and importance. But this abstention from harmful interference on their part has been accompanied, in most cases, by that abnormal concentration of power in the hands of the university president which has formed so prominent a subject of recent academic controversy.

It is a notable circumstance that, varied as are the methods of selection discussed in the *Times* article, there is not a word of discussion as to the tenure of the professor after appointment. That a professorship should be a life position it does not seem to occur to any one to question. The defects that exist in regard to the matter relate entirely to the way in which the selection is made. In this respect great differences exist; some of the university Councils proceed upon exceedingly crude "business" notions of the way in which the best man is to be found, while others have established methods that are, in the opinion of the *Times* writer, the best that could possibly be devised. In these cases the most careful inquiry is instituted, in the first instance, by a committee of the particular faculty concerned, an inquiry which results in the adoption of different methods—including, when necessary, that of advertisement—according to circumstances; the Senate considers the result of this inquiry, and then makes its recommendation of a particular person to the Council, giving "a full and reasoned statement" of the grounds for its choice. Of course, this recommendation is usually adopted without question; but the process, with a Council of the right sort, is evidently a wholesome one. It is not altogether different from that obtaining in some of our own universities; but what strikes one in reading of it is the profound realization of the importance of making the best possible choice. This, as well as the permanency of tenure, is sure to have a powerful influence in the preservation of the ideas of dignity and importance which ought to attach to the post of a university professor; and it is evident that in England as well as with us much will depend on the vigor with which, now and in the near future, those ideas are insisted on by public opinion in the educational world. "Lay hands suddenly on no man," but, having chosen him, let him feel that his position is assured—this is the rule that must guide in professorial appointments if we are to get the maximum of that real university efficiency which cannot be measured by any mechanical tests, but which has its root in the personality of the professors.

GRAFT ENDEMIC.

In the cablegram to the London *Times* about the burning of the Capitol at Albany, it was stated that the building had cost $27,000,000, one-half of which sum had "gone in graft." This is doubtless a gross exaggeration; at all events, it would be impossible to prove the assertion; but there is enough truth in it to make Americans abroad defenceless when their country is held up as preeminently the land of graft. Nor do we need to have the disagreeable fact rubbed into us by foreigners. Nearly every day's news at home does it for us. From near and far, in city and in country, the too frequent reports are of grafting, petty or wholesale. Last week at Harrisburg the Pennsylvania Legislature was appealed to by a responsible citizen who measured his words to send a committee to Pittsburgh to investigate a corrupt government levying toll on vice. A like demand was made by citizens of Hudson County, New Jersey. Jobbery in the building of their court-house is already being inquired into judicially. The estate of the late Boss Davis of Jersey City, whose funeral was attended by some of the most eminent men in the State, including the Governor, is now sued for large sums of money which he "borrowed" from the county treasurer. Even over the conduct of the public schools in New Jersey the trail of the grafter has been shown to run.

Gov. Wilson in a special message to the Legislature has referred to the reforms in the New Jersey educational system urged by the recent report of the Senate investigating committee. He did not, however, dwell upon the disheartening evidence which it produced of the existence of grafting in school boards. A few scandals of great magnitude were unearthed, having to do with the purchase of land for school sites and the sale of school bonds, amounting to plain malfeasance in office or outright thievery. But even more to the point was the committee's discovery of the widespread practice of grafting so small as to be doubly contemptible. This is the sort of thing which perhaps best illustrates the peril we have to contend with—namely, the pervasive feeling that everybody in office must get something out of it illegally, even if it be only a cake of soap or a box of stationery. We quote a revealing passage from the New Jersey report:

> Not only did we find boards divided along political lines, but we found members frank enough to admit that they expended money to be elected. What can be expected from such members? One did not hesitate to say that this committee had no right to expect and should not expect very high standards of honesty.
>
> One board did not hesitate to spread on the minutes that expenses for coach hire gold-mounted fountain pens for the members had been bought and paid for out of the school funds. In some districts the expenses of attending the funerals of deceased members are likewise paid for from the school treasury. In one it was recorded in the minutes that expenses for coach hire and flowers should be incurred and paid out of the children's picnic fund.

This extract is really more illuminating than the citations which might be made showing jobbery on a large scale; for it is this kind of petty graft which has become endemic in the United States, which constitutes a national reproach, and which must be fought as a national danger.

Well, but how, every one asks, are you going to prevent it? Take the case of the Bureau of Building in New York city, where the Commissioner of Accounts recently found instances of extor-

tion by inspectors. Is not the situation in that department virtually hopeless? You have officials with limited salaries but with almost unlimited opportunities for grafting, nearly secure from detection. It is all very well to say that we ought to have none but honest building inspectors, but how are you going to get them? How are you going to keep them honest in face of their constant temptations to make "easy money" by passing defective material or "helping" the contractor by not insisting upon too nice a compliance with the law? Such are the questions put by architects and others in the building business—men who are troubled by the official rottenness they encounter, who even do their best against it, but who almost despair of doing it away.

Their despondency would seem well founded if it were not possible to attack the problem from the other side. Mere efforts to tone up officials will not avail. No civil-service examination can detect the itching palm. Simply to exhort appointing officers to be careful and investigators to be unsparing and the courts to be severe will help only a little. We must go to the other end of the line. We must fix our attention upon the men who pay the graft or submit to the blackmail. Concerning them and their actions it is much more important to arouse a sound and vigilant public opinion than it is with reference even to official purity. The corrupt building inspector is corrupted by somebody, and he is the man we really ought to get after. Graft is given as well as taken, and the place to cut it off is at its fountain-head—that is, among those who pay.

They are not all consciously dishonest or unpatriotic. We know what they say. They wink at the payment of $10 to avoid a needless annoyance that would have cost them $500. They "retain" lobbyists and men with a political pull, because that is "the only way" and "everybody does it." But the growth and spread of the evil demand, first of all, a new kind of public spirit. It might be embodied in the phrase: "Millions for defence, not one cent for tribute." Men ought to exult in having spent ten times as much money in fighting and exposing and convicting a grafter as would have secretly satisfied him. It ought to be so that a stockholders' meeting would break into cheers when the president of the company reported that it had been "held up" by politicians for $25,000, but had resisted and had spent $150,000 in getting the evidence to send them to jail. There would be true patriotism in that, and it is the spirit that we must set ourselves to create in young and old or we are lost. But along with it there must also come a new attitude toward the men and the corporations who continue to let the graft flow. They should be made to feel the instant and burning indignation of honest men. The full power of social ostracism should be invoked against them. No matter how great their wealth or how high their position, despite all the fair semblance of good citizenship which they may assume, they should be made to know that they are frowned upon as corrupters of public life and traitors to their country.

THE NEW PERIODICAL VIRTUE.

Mr. Roosevelt and Mr. Bryan are at one in so many other things that it is not surprising to find them in a fellowship of kindred minds respecting newspapers and the magazines. Both of them have taken the position that the great mass of daily newspapers have ceased to deserve confidence. The reason is that many of them are controlled by criminal corporations, and that the rest allow themselves to be dictated to by advertisers, the net result being such a suppression or coloring of the news, and such an insincere or bought editorial utterance, that no dependence can be placed upon the honesty of the daily press. Yet the people are not without a substitute. They have found it in the weeklies and monthlies. These are free from advertising compulsion, they print the truth and nothing but the truth, they seek only to inform and lift up and save the nation. Absolutely fearless, wholly disinterested, true friends and champions of the common weal, magazine proprietors and editors are introduced by Messrs. Bryan and Roosevelt to a somewhat astonished people as the only honest men left in their calling.

Now, of course, to the charge brought against them, the newspapers are debarred, in the nature of the case, from replying. They are found out. In the mouth of two such witnesses as Roosevelt and Bryan, every word shall be established. No challenge for bias could be entertained against either of them; any one who should urge it would at once show that he was hired to do so by some wicked corporation. They know all about the untrustworthiness of newspapers because both of them have used the press for all that there was in it, but found the final result very unsatisfactory. So that daily papers may as well understand, first as last, that they stand condemned. Without insulting the public by attempting any defence, however, they might be pardoned for expressing a slight curiosity about the supernal virtues suddenly acquired by the magazines.

The sort referred to is well understood. It is the cheaper type that has risen to great circulation and vast notoriety within the past ten or fifteen years. This is the kind of periodical which, we are told, has supplanted the daily newspaper in respect and in influence. The fact we will not deny. But we cannot help asking about the men and the motives behind the fact. Are the one and the other as pure and exalted as it has been given us to understand? Have the popular magazines and weekly publications, in other words, been able to keep themselves unspotted from the world, entirely free from the difficulties and temptations which beset the newspapers?

For our part, we should be willing to leave the whole matter to the gentlemen concerned. If they could be subjected to a short cross-examination in the presence of Messrs. Roosevelt and Bryan, we believe that the whole truth would speedily come out. These proprietors and editors would privately look very sheepish under the halo that has been conferred upon them. We can easily fancy this magazine owner, with his automobiles and his luxurious mode of life, the other with his rapidly acquired fortune, this editor of a monthly and that editor of a weekly, refusing with a grin to be hailed as saints of the publishing business. Put the question directly to them, and they would say: "Yes, it is true that we rather blundered into this muckraking and uplift business. The first ventures were only experimental, copied from the daily newspapers, but when we found how the thing caught on and sent the circulation booming, we plunged for all we were worth and became worth a good deal

more in the process. Do good? Why, of course, we hope so; but we chiefly sought to do good to ourselves, and don't you forget that and think you can make plaster-saints out of us."

If one were to discuss the whole matter seriously, it would have to be admitted that the magazines of large circulation and large advertising (by which alone they live) have certain advantages. Not being so local in their clientèle as most newspapers must be, they are not so much subject to pressure from local advertisers. The extent of this pressure we believe to be greatly exaggerated. It is more of the nature of annoying impudence, easily brushed aside, than of serious demand; and, in its worst forms, is more often attempted than effected. But the fact that magazines are concededly more exempt from it than newspapers is only a trifling element in the whole problem. That, in its essence, is virtually the same for all classes of publication. There is not the difference, either in purpose or in method, that is pretended. Many men pass from the employ of newspapers to that of magazines. Do they think it necessary first to order their ascension robes? Writers often leave the magazines to work for newspapers. Is that so obvious a fall like Lucifer? And take the case, not infrequent, of a man who owns both newspapers and magazines; is he a saint in the office of the latter, but a very devil in the former? In this business, too, we should seek to clear our minds of cant. Public and effusive ascriptions of superior virtue to the popular magazines do no great harm; we always have to be putting somebody on a pedestal; but it is a pretty severe test of American humor—especially so when the statue itself which we erect is detected in a smile at the simplicity of its admirers.

THE CONGRESS OF TECHNOLOGY IN BOSTON.

Boston, April 14.

The Congress of Technology which met in Boston on April 10 and 11, in celebration of the semi-centennial of the signing of the charter of the Massachusetts Institute of Technology, was a pronounced success on the two main lines laid down by its projectors. They were, first, to show in the papers read at the public sessions, what applied science means to the life and prosperity of the public to-day; and, secondly, to make clear the fact that in the great changes, social and industrial, which have followed the development of applied science since the Institute of Technology was founded, the men trained at the Institute have taken a leading part in this great advance. This was made the more evident by the circumstance that all the papers, to the number of above seventy, were prepared by alumni or members of the faculty of the Institute, and were in a very real sense news reports from the advance lines of applied science, presenting the most important successes of the recent past, and some of the chief problems of the immediate future.

President Maclaurin of the Institute formally opened the proceedings of the Congress with an address on "Some Factors in the Institute's Success," given Monday afternoon in Huntington Hall. Following this came two papers of special interest, "The Spirit of Alchemy in Modern Industry," by William H. Walker, professor of industrial chemistry in the Institute faculty; and "Technology and the Public Health," by C. E. A. Winslow, Tech. '98, associate professor of biology in the College of the City of New York, and curator of public health, American Museum of Natural History, New York.

Monday evening, that of the first day, was devoted to a great "alumni smoker" in Symphony Hall, and to dinners held by most of the past classes.

The daylight hours of the second day were given over to the presentation of papers on various aspects of applied science. The papers were grouped in six divisions, and the times of reading were so arranged that the general public, a large number of whom had received personal invitations, were enabled to hear papers in several divisions. The result amply justified the plan. Every session was very largely attended, and as the papers dealt not with educational or technical abstractions, but were, on the contrary, striking and vital reports from the actual field of industrial work, the large audiences gained a better conception than would otherwise have been possible of the fashion in which applied science has re-made the life and habits of the world within the last half-century.

The Congress set clearly before the public the needs and the possibilities of what the speakers on Tuesday evening called the "New Technology." The high standard of the Massachusetts Institute of Technology, and its deserved fame as one of the very foremost technical schools in the world, hardly need reiteration. But the very success of the Institute has brought it to a point where insufficient endowment and cramped quarters threaten seriously to interfere with its future usefulness unless these obstacles are soon removed. The banquet in Symphony Hall on Tuesday evening, April 11, provided a significant sign of keen appreciation of this need both by the alumni of the Institute and by many others outside of its immediate ranks. The enthusiasm of the thousand alumni and guests who filled the floor of the hall was reflected in the words of the speakers, who included two such notable figures in Institute affairs as President Lowell of Harvard, long a member of the Corporation of Technology, and President Emeritus Eliot of Harvard, who was professor of chemistry in the original Institute faculty. The temper of this great meeting was significant in showing a sharp consciousness of a new era created by applied science; of the important part that has already been taken by graduates of the Massachusetts Institute; and of the pressing need, especially from the point of view of the interest of Massachusetts, that the Institute should be immediately equipped with the additional means for enabling it to continue in the future as it has been in the past, a leader in technical education.

The practical earnestness of the alumni in doing their full share toward making possible the "new technology" was shown in three announcements made by President Maclaurin after the banquet. One alumnus, who wished his name withheld, has offered to the Institute a tract of 1,000 acres of land in Maine, well suited to the uses of a summer school in civil engineering. Other alumni have definitely pledged themselves to contribute a large part of the price necessary for buying a new site for the Institute. Still another graduate, who is the head of a large cement company in Chicago, has promised as a gift all the cement needed for erecting the new buildings in reinforced concrete. Meanwhile, the question of the site itself, Dr. Maclaurin said, has been narrowed to a choice among three sites, all of which are within a short distance of the present buildings. It is expected that this question of a new site, upon which everything else in the development of the Institute depends, will soon be settled.

B. B.

PASSIVE RESISTANCE IN AUSTRIA.

Gratz, Austria, March 22.

An interesting strike came to an end February 25 in Trieste, the principal Austrian seaport. About a week and a half before this date, the government officials in the state railways, and the customs, telegraph, and post offices, of this important city struck for higher wages, demanding an increase of 20 per cent. Instead, however, of attempting to gain their end by leaving their desks and their tasks and thus tying up the public business, they adopted exactly the opposite course. During the first week, they caused a loss to the shipping and business of the city which

was estimated at a million crowns, or $200,000, and during the ten days of its duration a loss of double this amount. This method of striking, which originated in Austria, and, so far as I know, has not been tried elsewhere, is called by the English name of "Passive Resistance."

Such a strike could take place only in a burcaucratic country. The rules and regulations which define the duties of the various government officials in Austria are extremely voluminous. An official who follows these rules unintelligently or too conscientiously would not be able to do all the work expected of him, and it has consequently become the custom among the officials to use their judgment and to carry out the spirit of the regulations by often disregarding the letter.

It will readily be seen that a body of officials could easily take advantage of such a condition of things, and by following the regulations too exactly delay or even prevent the transaction of the public business, without, however, doing anything which could be construed by an indulgent and paternal government as a failure to perform their duties. For instance, in the post-office, the clerks are required to examine all incoming matter to see that it has sufficient postage. When on a strike, they weigh each piece most carefully, whether it is necessary or not, and take as much time to it as possible. Time is consumed in the same way in every department of the post office, with the necessary consequence that all the regular mails are late, often several hours, and the business of the office very much disorganized. In Austria, the post office does the express business of the country, and in handling the express packages the refractory officials could make their power to disorganize business especially burdensome. In the telegraph department also, the same delays would occur.

The employees of the state railways are required to see to it that the trains are in a fit condition to accomplish their journeys, and the rules prescribe the examination of the various parts of the locomotives and cars. When on a strike the employees carry out these rules literally, and take so much time to perform their duty that the trains are inevitably late in starting and often hours late in arriving at their destinations. In the freight department of the state railways, during the recent strike, business came almost to a standstill. In an ordinary business day, the railway issues about three thousand bills of lading at Trieste, but while the strike was at its height such delays were caused that this number was reduced to sixty or less. In the customs offices also the greatest disturbances occurred. Trieste is the home of two great steamship companies, the Austrian Lloyd and the Austro-American, as well as of several smaller ones, and a large volume of import, export, and coastwise business is done, and a large number of passengers received and forwarded. The vessels of these companies are scheduled to arrive and leave on certain dates, and it is of the utmost importance that the business of the port shall proceed smoothly. The officials, however, hold the key to the whole situation. Every ship entering or leaving the port must receive the proper papers from the port officials; all dutiable imports must be taxed and all passengers must be examined, both by the quarantine and customs officers. The refractory officials delayed all of these operations interminably. I will mention but a single instance. Large quantities of sugar in sacks are received in Trieste for export. Before it can be loaded aboard the ship, however, it must be inspected by an official, who usually opens a sack here and there and thus quickly performs his duty. During the strike, however, he ripped open and inspected every sack, and then slowly sewed it up again. Passengers' baggage was also examined with a thoroughness which would have made Mr. Loeb's men appear like novices. Even so important a man as Dr. von Derschatta, the president of the Austrian Lloyd Company, who happened to pass through Trieste, was detained an hour or more while his eleven trunks and bags were emptied and every article examined.

The effect of the strike was exactly what the officials had expected and wished. Trieste found itself suddenly and almost without warning unable to transact business, and a great cry of protest went up to Vienna. The Government, however, did nothing effective for a week and more. The granting of the demand of the strikers was never considered for a moment, for if the movement had been successful, the Government would very soon have had many such strikes on its hands in other parts of the Empire. Most government officials are very insufficiently paid in Austria, and if passive resistance should succeed in one place, it would certainly be tried in many others. To the outsider, the remedy of the trouble seemed very simple. Officials who were so blind to the proper performance of their duties and so totally lacking in official pride that they would deliberately use the powers entrusted to them to hinder the transaction of the public business, certainly deserved instant discharge from their places, and would have received it in almost any other country. But here in Austria things are different, and the situation is besides complex. In the first place, in Trieste Italian is the language of the bulk of the population, and there are also many Croatians and Slovenians. German is, however, the official language. A public official must thus know German and Italian, and, perhaps, Croatian and Slovenian as well. If the Government had discharged the striking officials, it would have found it difficult, or perhaps impossible, to fill the places of most of them, and it is, after all, better to have the public business done poorly than not at all.

In the next place, although it had no intention of satisfying the demands of the strikers, the sympathy of the Government was, after all, more with them than with the people of Trieste. The Imperial Government of Austria is conducted by aristocrats, who have little or no feeling for business, and especially for the business interests of Trieste, which is a notoriously rebellious city, and is constantly emphasizing its Italian character and its hatred of the Austrian domination. The public officials, on the other hand, undoubtedly deserve a good deal of sympathy, as they receive too little pay to support them comfortably in a city where the prices of necessities have risen 25 per cent. in the past ten years. Besides, they are a part of the government itself, and officialdom in bureaucratic Austria is a close corporation that is apt to think more of its own interests and welfare than of the public good.

The cause of the low wages received by the public officials of Austria is not far to seek. It is not the poverty of the Government or its unwillingness to pay a fair rate for the work done, but the undue increase in the number of officials in the past few years and the unnecessarily large number of them at present in the public service. Eighty years ago there was one official in Austria to 360 inhabitants. At present there is one to 50 inhabitants, and every seventh or eighth man in the community is fed at the public crib. The well-known economist, Professor Schmoller of Berlin, stated recently that of every 100 officials in Austria, 20 are competent, 50 tolerable, and 30 incompetent. The thirty incompetents are mostly aristocrats who have sinecures and draw the highest salaries. It is a notorious fact, of which the newspapers frequently speak, that the public business would be quite as well done as it is at present with half or two-thirds of the present official force. It would probably be much better done, for if there were fewer officials they would not get in one another's way so much or have so much time for gossip. One sees sometimes fifteen or twenty officials in a single room, a considerable proportion of whom are usually discussing the political situation or eating and drinking. For the amount of work they do they seem to require a vast amount of provender.

It should seem that, inasmuch as these facts are perfectly well known, the Government would reform the public service and thus seek to avoid passive re-

sistance and similar troubles in the future. It would undoubtedly like to do so, but it is not strong enough to resist the pressure of the office-seekers. Austria, with the numerous warring races of which its population is composed, presents the aspect of a country divided against itself. But there is one respect in which all these races are absolutely harmonious, and that is the desire to hold office. Notwithstanding the low rate of wages paid, the public service is very popular, and young men are crowding into it in ever increasing numbers. And with reason, for it furnishes an easy living and a good social position to the man and his family: it gives him a pension when he is old and one to his family when he dies. Austria is not a rich country. Her agriculture, industries, and trade are not highly developed, and cannot absorb the annually maturing crop of young men. Great numbers of these thus find the struggle for existence a very severe one. The more energetic of the agricultural classes find relief from these conditions in emigration, and great numbers of them come to America. Many of the vicious and less enterprising from the villages and farms become vagabonds and tramps. Young men in the cities and towns, on the other hand, who are without definite prospects in life and have had a good school education, are apt to seek the public service, or perhaps to go into the church. I am convinced that one reason why the church is so strong in Austria is that it is a great and rich institution in a poor country, which needs young men and women, and furnishes a good opening for all such who dread the struggle for existence.

This, then, is the situation here in Austria. It has existed for a long time, and because of the spread of education among the middle classes, has been steadily growing worse, and for this the excellent free schools and the compulsory military service are responsible. In the olden time the son usually followed in the footsteps of his father and learned his trade or profession, as, in fact, he still does if his father is a man of any means or has a prosperous business. If, however, the father's position in the community is a humble one or he is not prosperous or has a superfluity of sons, the young man is apt to look about for something else to do, and if he has received a good schooling and is besides a young man of little energy or initiative, he almost inevitably slips into the public service.

The compulsory military service also exercises an important influence in these matters. A young man who can pass a certain school examination need serve but one year in the army instead of three, which is at present the length of the compulsory service. Great numbers of boys of the lower middle classes are kept in school long enough to enable them to pass this examination, instead of being taken out at an earlier age to learn a trade. They thus grow away from their class, and very many, being no longer willing to follow a trade, enter the public service.

A tremendous pressure is constantly brought to bear upon the governments of the country, the provinces, and the cities to create new offices to accommodate the seekers. The Coalition Government which ruled Hungary, where the conditions are similar to those in Austria, from 1906 to 1909, increased the number of public officials in that country by 45,028, of which number a single Ministry (that of Count Khuen-Hedervâry) created 30,251 in ten months.

One of the most interesting social phenomena in Austria is the bitter and unedifying strife for the ascendency among the Germans, Bohemians, Croatians, Italians, Slovenians, Ruthenians, Poles, and the other races which make up its polyglot population. One is apt to think, looking on the surface merely and reading the fiery editorials in the representative newspapers, that the innate racial antipathies are the cause of this strife. This is certainly not true in any large sense. The dominant race in a province or city gets all the offices for its sons and all the public contracts for its business men, and here lies the *casus belli*. I am convinced that these twelve or fifteen different races would live together almost as peaceably here as they do with us in America, if the struggle for existence were no more severe than it is with us.

The problem which public men in Austria have to solve is thus largely an industrial one, which would solve itself if the business situation could be improved sufficiently. Austria must follow the example of its neighbor, Germany, and develop its industries and agriculture in order that all of its people may find profitable employment. They would not then flock into the public service, and there would be no danger in the future of a passive resistance.

What the Government finally did in the case of the strike in Trieste was to transfer some of its leaders to Pola and other towns in Istria, and to threaten still further punitive measures. Passive resistance at once came to an end.

HENRY S. PRATT.

NEWS FOR BIBLIOPHILES.

Mr. Hoe's collection of English Literature of the sixteenth and seventeenth centuries was one of the most important ever brought together. This portion of the library was described in the first five volumes of his catalogue, published in 1903. A representative selection of these books, including some of the most important items, is included in the first sale of the library which begins at the new rooms of the Anderson Auction Company on April 24.

Mr. Hoe's First Folio of Shakespeare was the Syston Park copy, one of the largest copies known, in a binding of red straight-grained morocco, ascribed by Mr. Hoe, but without much ground for it, to Roger Payne. It is unusually sound and clean throughout, and, except for the fact that the leaf of verses and title have been trimmed to the text and mounted (some letters of the title-page being in facsimile), it might be expected to bring the record price. The Second Folio is the most common imprint, but is an exceptionally large and fine copy. The Third Folio, also very large and fine, is (as usual) the late issue with title page dated 1664. The Fourth Folio has the rarest (and presumably the earliest) imprint: "Printed for H. Herringman, and are to be sold by Joseph Knight and Francis Saunders." The selection of Shakespeare quartos included in this first sale are "Henry the fift" (1608), King John" (1611); "Hamlet" (1611); "Henrie the fourth" (1613); "Richard the Second" (1615); "A Midsommer Nights dreame" (Roberts, 1600); "Loves Labours lost" (1631); and "Pericles" (1635). The first edition of the "Poems" (1640) is a large copy in old morocco by Lewis.

This first sale also includes most of the Ben Jonsons, beginning with the superb large paper copy of the "Works" (1616-1640) from Almon W. Griswold's collection. A few other copies of the first volume (1616) on large paper are known (Mr. Morgan has a fine copy with a presentation inscription in Ben Jonson's autograph), but no other copy of the second volume on large paper can be traced. Among several very rare Ben Jonson quartos are "Every man out of his Humor" (1600); "King James his Royall and Magnificent Entertainment" (1604), the copy which brought £116 in 1904; and "Chloridia" (1630), the copy which brought £145 at the same sale.

A long series of quartos of George Chapman appear in this sale. The "Seaven Bookes of the Iliades of Homer," with the "Achilles Shield" (both 1598), is in the original vellum binding, and is presumably the copy which brought £291 in 1904. The "Epicede or Funerall Song" on the "Death of Prince Henry" (1613) is a presentation copy from Chapman to Inigo Jones. This copy, however, does not contain the very rare plate of Henry's hearse. Another very rare Chapman is his "Euthymiæ Raptus; or the Teares of Peace" (1609). This is the Griswold-McKee copy.

The Caxton "Canterbury Tales" of Chaucer will be sold in a later part, but Wynken de Worde's "Troylus and Cresyde" (1517) and collected editions of Chaucer's "Workes" of 1532, 1561, and 1602 are included in this sale.

The long series of the works of Samuel Daniel includes the rare first edition of "Delia" and "Rosamond" (1592), of which the only other known copy is Malone's in the Bodleian. Three other perfect copies of the first "Delia" are known, but they are all accompanied by a later issue of "Rosamond."

Mr. Hoe's copy of Sir William Alexander's "Recreations with the Muses" (1637), with the rare portrait, was bought at the McKee sale for $760, and has since been elaborately bound. Only one copy of the first edition of Bacon's "Essaies," issued by him to forestall an unauthorized edition which was "going to print," is known in

America. This, formerly in the Rowfant library, is now in the Church-Huntington collection. Mr. Hoe owned the second edition (1698), almost equally rare, also the first edition of the "Apophthegmes" (1625).

William Drummond's "Poems" (Edinburgh, 1616), on large paper, is one of the most wonderful books in the collection. It is probably the copy which sold in the Auchinleck sale in 1893 for £48.

George Herbert's "The Temple," the very rare undated issue of the first edition, is the Brand-Heber-Daniel-Foote copy, costing Mr. Hoe $1,050 at the Foote sale in 1895. The date of 1631 has been wrongly affixed to it by Lowndes and others, but, as Professor Palmer has conclusively shown, this undated title follows, instead of preceding, the first published edition, dated 1633.

A Kilmarnock Burns (1786), entirely uncut and with the old blue wrappers bound in, is probably the most valuable eighteenth century book in the sale. This was the Kalbfleisch copy, bound up by him, not by Mr. Hoe. The Burns Museum at Ayr paid £1,000 for a copy in the original blue covers. Mr. Van Antwerp's copy, in the same condition, for which he paid $4,500 privately, brought only £700 when his books were sold at Sotheby's. Gray's "Elegy wrote in a Country Churchyard," first edition (1751); "Robinson Crusoe," first edition (1719), and other rare works by Defoe; Samuel Johnson's "Irene" (1749) and "Vanity of Human Wishes" (1749), both uncut; and John Gay's first book, "Wine, a Poem" (1708), are other notable books of this period.

William Blake's "Songs of Innocence" (1789), "The Marriage of Heaven and Hell" (1790), "Songs of Experience" (1794), and "Milton" (1804) are specimens of the engraving and coloring of this genius. The "Milton" is one of only three copies known, the two others being in the British Museum and in the New York Public Library. The Hoe copy is, presumably, the one which brought £230 in the Beckford sale in June, 1882.

There are many gaps in Mr. Hoe's collections of first editions of nineteenth century English and American authors. His collection of Dickens is unattractive, relieved only by a presentation copy of "The Village Coquettes" (1836). The three Keats volumes are in this sale, the "Endymion" being Haydon's copy and having one of the autograph letters to Fanny Brawne inserted.

The most notable among first editions of American authors is Bryant's "Embargo," the exceedingly rare first edition of 1808. This is the Hawkins copy which brought $41.50 back in 1887. No other has been sold at auction since. Mr. Hoe procured it in the N. Q. Pope collection. Hawthorne's "Fanshawe" (1828), Longfellow's "Outre Mer" (1833-34), and a presentation copy of his "Poems on Slavery" (1842) are among other notable volumes.

Autograph letters and manuscripts are not numerous in the Hoe collection, but a number of fine items are scattered through the two volumes of the catalogue. The Irving manuscripts include important autograph revisions of the "Sketch Book," "Life of Goldsmith," and "Knickerbocker's New York." Series of letters of Burns and Franklin, two fine letters of Poe, and other literary manuscripts are included in this first sale.

Correspondence

AN INTERNATIONAL PEACE.

To the Editor of The Nation:

Sir: The response that has met the great speech of Sir Edward Grey from the British people, the clergy, and the press is very gratifying. It is sure to be strongly approved by the press, the clergy, and the people of our own country. It shows clearly that the people of England and America prefer some more reasonable and practical method of settling disputes than the expensive and burdensome methods heretofore prevailing.

The first great step in the present movement was taken when Canada and the United States agreed on a reciprocity treaty that might reduce somewhat the cost of living in both countries. It would be difficult for the few people that may be interested on each side to defeat a treaty which will so materially benefit a great majority of the two peoples.

The second step in bringing the two branches of the English-speaking race into accord to such an extent that they are prepared to make a treaty that shall provide a way for the reasonable settlement of any differences between them, is pretty sure to meet with universal accord; and if such a treaty can be made between two of the most powerful nations in the world, the example will be sure to extend to other countries. It is gratifying to learn that France is already in correspondence with America for a similar treaty.

Now, if at this juncture there might be taken some action by the different governments to set apart a reasonable proportion of their present armaments as a police force to protect each nation in all its rights, both territorial and political, from aggression from any source, the world might have speedy relief from heavy armaments. But we may not hope for such a result at once. We must prepare gradually for it. Heretofore each nation has adopted the principle of settling its own difficulties with all the rest of the world independently. It has been a highly expensive and burdensome operation, and has not resulted in procuring in any satisfactory way the desired end. In fact, we are going backward every day while these armaments increase. The nations seem almost beside themselves in mutual fear of attack. They are suspicious, and every Dreadnought increases that suspicion. It is a wrong principle. It is not in separate action, but in combined action, in coöperation, that we must seek relief.

I wish to offer a plan for solving this problem. My idea is to take a portion of the present armaments, say 10 per cent., and establish an international army and navy. In taking such action we should avoid any discussion concerning the proportion that each nation should contribute to this international force, for each one is only required to contribute a quota relative to its own present equipment. The advantages of such a readjustment are these: It will cost practically nothing, and by posting sections of this international force in the places where trouble is most likely to occur, adequate protection will be obtained. The establishment of this force would not interfere with the present military organization. That would go on as now, relatively as strong; so that each nation could safely enter upon the experiment which would result in the beginning of permanent disarmament. Edwin Ginn.

Boston, April 13.

DESIRABLE IMMIGRATION.

To the Editor of The Nation:

Sir: The address delivered by Secretary of Commerce Nagel at the recent Italian Congress in Philadelphia concerning immigration methods, contains a short paragraph which may well be taken to heart by all who are interested in our industrial and political future. Secretary Nagel said in part:

> All the family ought to come or all ought to stay. The family is the unit of American civilization and good government. If a man is fit to come, the highest evidence of his qualification for American citizenship will be his loyalty to his family.

Of course, we have long recognized the family as being the essential unit, but in the midst of other considerations we are prone to forget this first requisite. Racial differences have been over-emphasized, while the things that tend to a real assimilation of our foreign elements have been forgotten. For a long time it was customary to permit separation of friends and relatives in the task of shipping the immigrants from the seaboard westward. Fortunately, through the efforts of the Immigrant Clearing House, in coöperation with the railways, this evil has been minimized.

Now that the danger of separation *en route* has been avoided, an added incentive should be given to the man immigrating to bring his family with him. The United States may have suffered somewhat in the past through the negligence of authorities in admitting diseased persons to our shores or through the swindling action of steamship companies; yet on the whole immigration has proved profitable, and yet remains so.

Gen. Francis A. Walker once asserted that had immigration been restricted entirely our population would not have been less, because the native stock would have been more prolific. But such a statement must necessarily remain unsubstantiated, and to many it will appear extremely doubtful whether such would be the result in an actual trial.

However, we appear to be approaching more nearly a mean which will be neither absolutely prohibitive nor recklessly lax. Secretary Nagel has given a good concrete expression of the ideal that must be sought for, namely, the immigration not of the individual, but of the family.

Earl A. Saliers.

University of Pennsylvania, April 10.

IMAGINATION AND MEMORY.

To the Editor of The Nation:

Sir: In your issue of April 6 there is an interesting communication from Mr. Andrew Lang. In this, he comments on a curious problem, raised by a little book "The Adventure."

In 1901, the narrators "paid a visit on an

August day, after luncheon, to *le petit Trianon*. They knew nothing about the house, except that Marie Antoinette used to amuse herself there in a rural way." Briefly, they saw persons in the garb of 1789, saw a lady who resembled the portrait of Marie Antoinette, etc. Some days passed before each told the other that the Trianon seemed haunted, and months passed before they spoke to each other freely on the subject. Mr. Lang properly suggests that the study of maps and old records by these estimable women after the visit to the Trianon had unconsciously colored their memories.

May I recall a curious experience of a similar nature? In 1887, I visited the Museum of National Antiquities at St. Germain. Dr. Mortillet, the director, accompanied me through the various halls and showed me the amazing collections of palæolithic man, made by archæologists whose names are classical in the literature of the subject. In the summer of 1889, I was in Paris again and with a friend visited the Museum. On our way out to St. Germain, I described to him the beauties of the museum, the wonderful mural paintings portraying the cave dweller, neolithic man, the models of dolmens, etc., and particularly the two colossal equestrian statues in bronze, representing an ancient Gaul and an ancient Roman, designed by Rodin, the armor, weapons, harness trappings, and other details rigidly designed from the very objects exhumed in France, which formed part of the collection. These statues stood on a colonnade which overlooked the plains and faced Paris. Dr. Reinach, the director, with his usual courtesy, accompanied us through the various halls, and, finally, I asked him to direct us to the colonnade, as I wished to show my friend the colossal equestrian figures, designed by Rodin. He looked somewhat perplexed and said he did not know to what I referred. Somewhat amazed at his bewildered look, I mentioned rather impatiently the great figures in bronze and asked if they had been removed. He said they never existed! I soberly told him they had been shown me by the former director, Mortillet, a few years ago. He said he remembered my visit quite distinctly, but he had never seen or heard of the bronze statues. I then asked him if he would kindly show me the colonnade facing Paris, thereupon, amused by my insistence, he went to the side of the room, raised a window, and I looked down at the identical colonnade I had in mind, but no statues! I turned to him in amazement, and after we had gazed at each other for a moment, he turned to a little cupboard and brought out two small plaster cast models, and said, "I wonder if you refer to these?" He said they were designed by Rodin after a suggestion by Mortillet, whose ambition it was to have them made life size and placed upon the colonnade. He had never been able to carry out the idea.

Now the winter before, I had given a course of Lowell lectures on European museums, and I was sure these wonderful statues had been described in the course, for no impression more clear and vivid had ever existed in my brain. Immediately upon returning home, I hunted up my lecture notes and my original journal notes and no reference to the statues, nor even to the diminutive models, could be found!

This again illustrates the unreliability of human testimony. EDWARD S. MORSE.

Salem, Mass., April 12.

THE ASTOR LIBRARY GHOST.

TO THE EDITOR OF THE NATION:

SIR: The "passing" of the Astor Library, so soon to be an accomplished fact, reminds me of two or three incidents, which may be of interest to your readers. As I entered the service of the library in 1855 (six months after it was opened to the public), and resigned in 1865, I suppose I am the only person living who was officially attached to the institution during that period. Dr. Joseph G. Cogswell, then superintendent of the library, and Daniel Willard Fiske (afterward a professor in Cornell University), with a janitor, comprised the working force of the library when I entered its service.

The story of the "Astor Library Ghost" was first published in the New York *Evening Post* a day or two after the occurrence, and when it had begun to be talked of in the clubs, Francis Williams, who was then on the staff of the paper, and was my personal friend, called to see me about it, and I gave him the facts, as I knew them; this was about 1862, I should think, as Dr. Cogswell resigned in 1863.

Dr. Cogswell was dining with other guests at William B. Astor's, who lived next door to the library, and, "ghosts" having been mentioned at the table, related the story. George Bancroft, who was present, was my informant on the day following the dinner.

One night toward midnight Dr. Cogswell was moving about in the upper galleries, as was his custom, verifying titles and carrying a lighted candle. While at the west end of the south main gallery he dimly saw the figure of a man standing in the southeast corner (where the books on occultism were shelved). Approaching the figure, he recognized it as appearing to be that of a well-known physician, who had resided about the middle of the block, on Lafayette Place, and had died there some weeks before. This apparition held in his hand an old French folio edition of the "Predictions" of Nostradamus, published in the sixteenth century. Dr. Cogswell stated that on three different nights he saw the figure—which disappeared on being addressed by him. When the trustees of the library thought over the story, they judged that the learned superintendent had been overworking (which he always was), and gave him a vacation, and I well remember the twinkle in the old gentleman's eyes when he told me about it, placing me in charge during his absence. Mr. Fiske had resigned from the library some time before.

The day after the promulgation of the ghost story, the Rev. Pierre Irving, the nephew of Washington Irving, called at the library and asked me about the matter. In the course of our conversation, he told me of a similar case that had come within his own experience.

It occurred at Sunnyside, the former residence of Washington Irving. Pierre Irving and the two grand-nieces of Washington Irving were seated in the front room, talking, on a summer afternoon the year following Washington Irving's death, when one of the ladies who was facing the open front door suddenly rose, and cried out excitedly, "Why, there's uncle"; all rose at once and gazed at the door, through which there passed the form of Washington Irving, dressed and appearing as in life. He crossed the room, passed through a door in the opposite corner, and disappeared in the room which had been Mr. Irving's library and writing-room. They all saw him enter that room, but when they followed him in it was empty and there was no other means of exit.

An interesting occurrence which has escaped public knowledge is connected with Washington Irving's will, which was signed in the southeast corner alcove on the ground floor of the old building of the Astor Library and witnessed by Daniel Willard Fiske and myself. Mr. Irving dropped into the library one day, and, seeing us standing together, remarked: "I have been carrying around in my pocket for some days my will, waiting to have it witnessed; will not you two gentlemen oblige me?" So we all went into the corner, where Mr. Irving acknowledged his will, signed it, and we bore testimony thereunto. Mr. Irving died November 28, 1859, and some months later Mr. Fiske and I went up to White Plains and testified to our signatures.

My personal experience as an official in the Astor Library occurred during the superintendence of Dr. Cogswell and Francis Schroeder, the father of Rear-Admiral Seaton Schroeder, whom I very well remember as a boy. FRANK H. NORTON.

New York, April 7.

THEOCRITUS IN AMERICA.

TO THE EDITOR OF THE NATION:

SIR: Apropos of your notice on February 9 of Robert T. Kirlin's "Theocritus in English Literature," and the author's remarks quoted therein regarding allusions to Theocritus in our American papers and magazines, may I call attention to the fine paper, "Tennyson and Theocritus," in Edmund Clarence Stedman's "Victorian Poets," chapter vi, pages 201-233, of the edition of 1875. Whether this essay is known to Mr. Kirlin or not, or whether it ever appeared in paper or magazine previous to its publication in book form, I do not know. But the essay is evidence that Theocritus was known and appreciated in America some considerable time before "the last decade," and is not only of value as regards Theocritus and his relations to Tennyson, but, as Mr. Stedman says in his preface, "relates to a matter which seems to me of more significance than the obligations of the modern idyllist to the ancient, namely, the singular likeness of the Victorian period to the Alexandrian, manifest in both external conditions and poetic results." ALFRED G. LANGLEY.

Newport, R. I., March 30.

THE STATUS OF THE PROFESSOR.

TO THE EDITOR OF THE NATION:

SIR: Having read with interest the editorial in your issue of March 9 on "The Status of the Professor," I should like to say that, from one point of view, the "submergence of the self-assertive personality of professors" is not a widespread evil, in spite of the possible existence of the so-called personal domination of the college

president. A man may enter the presidency with the highest ideal of working with his faculty in the spirit of coöperation and harmony, but unless he is associated with a body of men, each one of whom is a gentleman of honor, as well as a scholar, having breadth and wisdom to see that his own interests cannot always be forwarded at the expense of some other department, or, in other words, who will himself cooperate, a president cannot continue his work along his chosen lines. This has been tested and proved. When a college faculty can be found that is imbued with such breadth and wisdom, we shall have the ideal institution needing no personal domination—"a company of gentlemen and scholars working together, with the president simply as the efficient centre of inspiration and coöperation." I fancy that the college president himself would be the first to rejoice in the new order of things.

A President's Widow.

New York, March 29.

CAR FARES IN CLEVELAND.

To the Editor of The Nation:

Sir: In your editorial in the issue of April 13 you comment upon the public reputation of Tom L. Johnson, and, in speaking of his contest to procure three-cent fare on the street railways of Cleveland, say: "On some lines for some distances there is three-cent fare in that city."

Accuracy is always important to the *Nation*, and I, therefore, take the liberty of saying that on *all* lines for *all* distances in the city of Cleveland the street railway fare is three cents, unless a transfer is needed from one line to the other, in which case one cent is charged for the privilege of transferring. Newton D. Baker,

City Solicitor.

Cleveland, O., April 14.

A POET'S VISION.

To the Editor of The Nation:

Sir: I came the other day upon a curious poetical anticipation of a modern achievement in the Latin epic, "Jesus Puer" of Thomas Ceva. Speaking of an imaginary aerial fleet, the poet says:

Ilia rotis se circinat aëre magnis,
Paulatim ad terras spiris ingentibus acta.

"Puer Jesus" appeared in 1690; an expanded edition was published in 1732.

C. H. Ibershoff.

Harvard University, April 12.

SHODDY.

To the Editor of The Nation:

Sir: After reading your "Symphony in K Flat" (*Nation*, April 13), I regretted that you had overlooked a civil war rhyme, as follows:

Around the bar-room fires these wintry nights,
Drinking whiskey toddy,
While shiver, shiver in the camps
The men they clothed in shoddy.

Philadelphia, April 15.

Literature

THE CONFEDERATE VICE-PRESIDENT.

Recollections of Alexander H. Stephens: His Diary kept when a Prisoner at Fort Warren, Boston Harbour, 1865: Giving Incidents and Reflections of his Prison Life and some Letters and Reminiscences. Edited, with a Biographical Study, by Myrta Lockett Avary. New York: Doubleday, Page & Co. $2.50 net.

May 25, 1865, by order of the government of the United States, a political prisoner was brought to Fort Warren. The fort was situated on George's Island, in the harbor some seven miles out from Boston. The parapeted and bastioned ramparts were solidly constructed, and all the ways of the fort were securely guarded by Federal troops. For greater safety the prisoner was nevertheless taken to one of the lower cells, and kept there, save for an hour each day, under lock and bar, in solitary confinement. Day and night, armed sentries paced up and down before the door. Some military desperado, no doubt, to call for so much enclosing masonry, so many locks and bars, such unceasing vigilance? No; only a frail little man, weighing less than a hundred pounds, whose whole life had been "one constant physical pain"; a man who had done what he could to prevent war; who had, after the war was over, remained quietly at home, ready, at the request of the Federal government, to present himself for trial, or otherwise to submit to whatever demands might be made. In the cell where he now found himself so securely confined he struggled uncomplainingly against pain and illness, scarcely able, at times, to stand upright; wept at the thought of his family; sought consolation in his much-thumbed Bible, or in simple prayer; gave himself up to religious and philosophical reflection, trying desperately to justify the ways of God to man; and if guilty, after all, of momentary irritation and complaint one day, humbly took himself to task for it the next. The prisoner was Alexander H. Stephens, former vice-president of the Confederate States of America. We hasten to assure the reader that he did not escape, even when removed to an upper room and allowed the freedom of the fort, but remained there until October 13, when, having been released by order of the Federal government, he returned to his home in Georgia.

The Prison Journal, composed from day to day, makes the main part of the book. It is a welcome addition to the literature of American history. In it we find, as we should naturally expect to find, a statement of the author's views on political and constitutional questions. What these views were is well known. They have been most often noticed in order to contrast them with the views of men like Webster and other Northern leaders. It is nevertheless true, though not so often noticed, that while the views were different, the point of view was the same—a point of view which is important because it gives character to the political thinking of the second quarter of the nineteenth century, in Europe as well as in America. The statesmen of that generation were apt to make a fetich of constitutions, and to conceive of political liberty as a recorded definition rather than as a living fact. It was an age of doctrinaires who confided their souls to the safekeeping of the written word; and thus we may enjoy the spectacle of a Guizot with solemn confidence battening down explosive social forces under a Revised Charter, or a Macaulay with complacent optimism resting the edifice of Human Happiness upon a Reform Bill. And in the United States it was no less characteristic of "Liberalism" to think of liberty as dwelling only within the limits of the *pays légal*. Webster and Calhoun and Stephens were alike in this, that they loved the Union not less but the Constitution more. The Union of which they were enamoured was a thing created by definition—a Union *ex hypothesi*, existing, as one might say, mainly for dialectical purposes. The life of a great nation, they seemed to suppose, could be run in the rigid mould of written law. To make the Union fit the Constitution was almost the sum of their political philosophy; and if they disagreed as to what, precisely, the Constitution was, they were quite agreed that outside of it there was no salvation. "No one ever lived," we read in the Prison Journal, "with stronger feelings of devotion to the Constitution of the United States *and the Union under it* than myself. . . . For the Union barely, without the rights and guarantees secured by the Constitution, I never entertained or professed any attachment." And Webster speaks of that "chosen Constitution" under which the people "have seen their happiness, prosperity, and renown grow with its growth, and strengthen with its strength." Not for these men was it to say that there was a higher law than the Constitution, or that the nation could not permanently endure half slave and half free, or yet that the "peculiar institution" had at last outgrown the organic law. When men began to see that constitutions must be made to fit changing social forces, the age of "Liberalism" was over and the age of "blood and iron," or of gold perhaps, was ushered in.

But the Prison Journal is mainly interesting, not because it contains a statement of the author's political ideas, but because it contains a simple,

unaffected account of the thoughts and feelings of an honest and very lovable man. Having read the Journal we feel that we know Alexander H. Stephens as we know Cellini, or John Stuart Mill, or Gen. Grant; our only regret is that it has been necessary to wait so long to know him in this intimate fashion.

Not a man certainly of profound or illuminating intellect: a great reader, we suspect, and one whose interests were wide; but appreciation hardly kept pace with curiosity, and apart from constitutional questions his grasp was in no way remarkable nor his judgment very sure. The Book of Job is a favorite, to be sure, but Bacon's Essays he finds "nothing but loose sayings on divers subjects," except the one on Friendship, which is good—better, on the whole, than the remarks of Cicero on the same subject. The Economics of Aristotle appeals to him, but the Politics he regards as "of little value." He enjoys Prescott immensely, but cannot think that the motive of Matthew Arnold is a worthy one. Meanwhile his practical mind hazards the conjecture that the Song of Solomon was never intended as an allegory: he believes it was only a love song.

The clear, practical intelligence of the man was deep-rooted in an emotional and profoundly religious nature: some instinct in him was always reaching out after the unseen forces of the world. It was his practice to open the Bible at hazard "with a fervent prayer to Almighty God to be directed to some chapter of His Word from which I could derive comfort."

> I took up my Bible with a desire to find in it something on which the soul could rely for comfort and hope. The book opened at Isaiah 38. Was it accident? Believing all things are under the direction of the Ruler of the Universe, by whom even the hairs of our heads are numbered, I secured consolation from this chapter. As has been my custom for the last twenty years or more, before committing myself to sleep I committed my body, soul, and spirit to His keeping, praying devoutly that His will "be done on earth as in Heaven."

And he adds:

> This fact I here record mainly because religion is a subject on which I seldom speak or write. Perhaps in this I have done wrong. It has arisen from a very deep aversion to what I consider "cant."

No dry rationalist or "philosophical radical" ordering his steps to the measured beat of a syllogism, he thinks that "all signs and omens are good to those who believe in them." He will not admit that he believes in them, and yet, "I always like to get a first view of the crescent in a clear, bright sky without intervening obstructions." A very human man, with charming inconsistencies and delightful little aversions: he could not drink coffee out of a glass, and liked water best out of a gourd.

If much affliction did not make him rebellious, neither did it sour his temper. A simple and kindly man, wholehearted and boyish in his affections, without malice or evil intention. Friendly toward all men and superior to none, he never knew a negro who did not like him, and we can well believe there never was one—certainly not his own slaves, for whose welfare he spent much more than they ever returned. His solicitude for the future of the colored race finds constant expression in the Journal, and his desire to get his own former slaves well settled was one of his reasons for desiring to be released on parole. There is genuine pathos in the constantly recurring expression of affection for his family. "Thoughts of home, my brother, and all the dear ones there, black and white, almost kills, almost crazes me." And then his beloved Georgia! There never was such a State! Once he was served with a portion of watermelon, "red meat and black seed. It is excellent." But, on second thought, "not so sweet and delicious as Georgia melons"! Certainly not! We can well understand that.

The man's humor was not all unconscious, however. The humorous side of things, he tells us, always appealed to him, and he could laugh at himself as well as at another. It is a proof of it that even in solitary confinement the trait was not wholly obscured. True, he can raise only a faint smile; the humor does not easily rise from the solid earth. Apropos of some remarks about a mouse he was trying to tame, he mentions another less desirable sort of companion, "whose nature it is to stick to you closer than a brother and to keep you awake all night. Since my row with them the other day, I have not seen or heard anything more from them. If they have made any attack, it has been a sly one in small force." And then, honest man that he was, who would have everything clear and precisely set down, he adds, "Of course, I mean bedbugs." Even in jest one would not wish to leave a wrong impression!

CURRENT FICTION.

The Patrician. By John Galsworthy. New York: Charles Scribner's Sons.

With his usual intense, even passionate, concentration upon one aspect of modern English life, Mr. Galsworthy here produces a novel of dignity and power. If it were not for a certain slackening of nerve or wavering of aim apparent in the later chapters, we should incline to call it a great novel. The types are the immemorial types of English fiction. The main situation, baldly stated, is as old as the hills. But both type and action, throughout the greater part of the narrative, appear to have undergone the sublimation by which genius is wont to convert the commonplace into the rare and potent. If it is a chief triumph of fancy to give a local habitation to airy nothing, the complementary feat is to transmute a leaden something into the gold-dust of the upper air.

The persons arrange themselves in the familiar British pyramid. At the bottom is a broad base of servants, lodging-house keepers, villagers, and so forth; midway are the romantic protagonists; and above, dominating and stern, sits Authority—in the person of the immortal dowager. To the old Lady Casterley of this tale falls the same solemn duty that erst devolved on the Lady Lufton of Framley Parsonage. It is for her to persuade the ineligible charmer of the Hope of the House to discourage his misguided addresses. The ineligibility of that charmer is, to be sure, of a far more complicated kind than that of sweet Lucy Robarts. Audrey Noel is a married woman, for whom, though she is virtually separated from her husband, divorce is, under the English statute, impossible. There is therefore no danger of her getting a legal hold on Lord Miltoun. But he chances to be of those for whom the moral hold is everything. Politically he stands for the conservatism of his order, and his nature is deeply religious. The establishment of an illicit tie therefore means the ruin of his just-begun parliamentary career. He will not give up Audrey, nor will he maintain a secret connection. She cares nothing for his career, but much for his happiness, and (spurred on by the dowager) succeeds in procuring it for him at the expense of her own. Authority is vindicated also in the separation of Miltoun's sister, Lady Barbara, and Courtier, the man she loves. A girl of unusual spirit, breeding and circumstance subdue her, as Courtier is sufficiently wise to foresee that they must. As for him, he is Miltoun's opposite in mind and temper, a radical and idealist, whose life is built upon faith in human nature, while Miltoun's is built upon distrust of it. In action, Courtier is the nobler of the two, and yet Miltoun is noble. Mr. Galsworthy's interpretation of the two characters is equally sympathetic, and this is true also of Barbara and Audrey. But it is hardly necessary to say that the book is a plea for the new order rather than a defence of the old.

The Lame Englishman. By Warwick Deeping. New York: Cassell & Co.

This writer has made himself known hitherto as a skilful writer of historical romance of the popular school. He has built a number of tales ("The Red Saint" may be recalled as the last of them) in which love-making, historical detail, and picaresque adventure were mingled in the right proportions. The present story still has the advantages and the disadvantages of the historical

setting. The place is Italy, the time that of the Garibaldian struggle. Bloodshed and perilous adventure are not lacking in these pages. But for the first time, so far as we know, the writer has succeeded in subordinating both history and romantic incident to real characterization. Francesca Merula is the disillusioned wife of a Roman sensualist. The new patriotism, the movement toward a united Italy, become her refuge. The husband, outwardly indifferent, is secretly a servant of the reaction. She gets knowledge of a plot against the life of Mazzini, warns the leader, and tells her husband what she has done. He is a coward, and at once leaves Rome. Francesca has already become acquainted with a young Englishman, almost a cripple, but a man of spirit, fired, like her, with ardor for a free Italy. He enlists in the Garibaldini, and bears his part well. But the enterprise is doomed, and the day comes when the lame Englishman and the passionate but blameless Francesca must fly from Rome. She dons the Garibaldian uniform; and at the moment when escape is almost accomplished, that blot of color in a wood brings death to her, and the lame Englishman takes pains to follow her by the same road without delay. The restraint and dignity of this final scene, which might so easily have been mere melodrama, put a seal upon one's impression of the story as a sincere and well-wrought piece of work.

The Simple Life Limited. By Daniel Chaucer. New York: John Lane Co.

This book belongs roughly to the paradoxical school of modern British novelists. It shows the influence of Mr. Wells, of Mr. Chesterton, and of Mr. Bennett in his whimsical mood. The scene is rural England. The chief persons are Simon Bransdon, born Simeon Brandetski. After an adventurous early life, and brief success as an English novelist, physical shock reduces him to a state almost of lethargy. His talent is not eclipsed, but his ambition and common-sense are in abeyance. One Gubb gets hold of him—a professional parasite with an instinct for marketable powers in others. He makes an oracle of Bransdon, builds about him a theory of the simple life, and founds a colony of "Lifers," out of which he contrives to make a handsome profit for himself. There is obvious chance here for a variety of "character" parts, and the writer takes full advantage of it. Nearest to caricature are a young pair, a male Gubb and a female Bransdon, who begin by taking the Simple Life movement with the utmost seriousness, and end in complete skepticism. The "Lifers" in bulk are disposed of as types:

> The elder women were mostly of gray complexions; they dressed in gray tweed with boat-shaped hats and they had, as a rule, timid eyes and very slight, silvery gray, delicately suggested moustaches. Their menfolk wore, as a rule, timid and anxious expressions, cycling breeches, and thin gray beards.

The younger women "nearly all contrived to make their necks appear inordinately long, and they were all round-shouldered." One or two marked figures appear in the midst of this pale throng—a Mrs. Lee, suffragette in type though not in function, and a wild Russian Brandetski, cousin to Simeon. The most human persons in the tale are Mr. Luscombe, a country squire of substance, who permits himself to be used by the enterprising Gubb, up to a certain point, and a Mr. Everard, promoter and impresario, and conqueror of pleasure-loving London. As a story, the affair, which begins promisingly enough, trails out to great lengths of irrelevant incident. The writer seems to have little power of selection among the sufficiently copious materials which offer themselves to his whimsical pen.

Neighbors Unknown. By Charles G. D. Roberts. New York: The Macmillan Co.

Of this new collection of Mr. Roberts's "nature" stories, we need only say that it is as good as its predecessors. Freshness of matter or manner cannot be claimed for it. Indeed, after twenty years' exploitation of the habits of the polar bear, the caribou, the lynx, and the rest, we have little new information to look for. But of possible new combinations of the old matter, there is no calculable end. After the lynx has slain the wolf, he may still be pitted against a dozen antagonists in succession: and there is always the deadly rifle in reserve. The most striking of the present sketches is "The Tiger of the Sea"—the adventure of a foolhardy man with a killer whale. They are all good in their kind. It is to be doubted if that kind is likely to retain its popularity much longer with so fickle a public as is made up of confirmed fiction-readers. After all, the lover of nature and inquirer into the "way of the wild" does not go for his fun or his profit to such books as this: they must stand or fall as fiction.

THE SOCIAL COMPACT.

Individualism: Four Lectures on the Significance of Consciousness for Social Relations. By Warner Fite. New York: Longmans, Green & Co. $1.80.

Professor Fite's lucid and powerful analysis of the social compact lacks certain current fashionable features. The subconscious, we believe, is not once mentioned in the book; the psychology of the crowd receives scant courtesy. In general, the big, vague, comforting words of collectivistic and humanitarian theory are absent. And the style has merely the color and emphasis of sound thinking and conscientious analysis. It requires some audacity in a modern author to conceive a sociological and philosophical work so nearly in the spirit and style of those obsolete writers David Hume and Adam Smith.

The cardinal doctrine is that the only rational basis for moral action in the individual and for right social adjustment is enlightened self-interest. Enlightenment naturally implies that all action shall be conscious and intelligently chosen. "For the conscious individual the ideal of life is not to relegate any part of his living to the care of nervous automatisms, but to make every feature of life the object of immediate conscious control and the object of immediate conscious satisfaction." The difference between a life thus directed and a selfish life in the usual sense is a difference of intelligence and outlook. The selfish man perceives only parts of his own situation and the attitude of others imperfectly or not at all. A truly wise and moral man will in every action take his fellow's case fully and fairly into consideration. He will not waive his own end, but will contrive to attain it with regard for the other man's end. In other words, where there is mutual understanding of a situation in its entire import, a mutually agreeable and profitable adjustment is always possible. The normal state of man in society is, then, not, as mechanical criticism has asserted, one of warfare, but of adjustment, and the possibility of such adjustment rests ultimately upon the fact of individual consciousness. A man must be clear about himself, his meanings, and aims, before he can deal with others or be dealt with. Mere instincts of the clan, nation, or race lead us shortly to strife. Altruism affords no real adjustment and breeds self-deception. We must transcend these impulses and sentimentalities and learn to know ourselves in others:

> As long ago as Socrates (writes Professor Fite), it was recognized that the most difficult problem of life is to know yourself. For us it is the whole problem. Yet to have located the problem at this point is, as I conceive, a great gain, for it means that the problem is theoretically soluble and it points the direction of the solution. For our special purpose it means that there is no inherent contradiction between social welfare and individual freedom; and therefore that the duty of self-sacrifice for the common good is not merely paradoxical but unintelligent. Every self-conscious agent has, in the nature of things, a right to self-realization. And as rational beings we are bound to assume that every social problem can be solved by careful analysis and adjustment of individual aims. Such adjustment will involve proximately a detailed study of each problem presented, but ulteriorly something more comprehensive and permanently effective, namely that general state of mutual understanding which is the product of an enlightened culture.

Such is the doctrine, an eminently melioristic one, and novel in its reconcilement of personal and social aims. To establish it Professor Fite naturally has to meet and confute those views of morals which lay the roots of choice in unconscious or altruistic motives. In showing the inconsistencies of those who ascribe to the child a set of social impulses mechanically inherited he has little difficulty. On these genetic matters he personally observes a wise agnosticism, though he strikes hard at the notion of primitive man as begetter of the social virtues. Primitive man is in the pre-social state, being merely gregarious; the conquests that count are those of self-conscious civilization. A political corollary to the doctrine of intelligent self-seeking is that the intelligent man has the natural right to self-realization precisely according to the degree of his intelligence. A wholly unintelligent person could have no rights whatsoever. From the fact that individuals may understand each other's aims arises a genuine social compact, a duty and pledge of adjustment.

The moral issues raised are freely illustrated from modern industry and politics. A trenchant observation is that our highly concentrated manufacture is really conscious only on the side of production, so that the economies achieved in production are promptly squandered in random and unintelligent distribution—riotous advertising and the like. Again, it is the absence of real consciousness that makes it morally and legally absurd to invest corporations with personality. The ultimate ethical difficulty that in this doctrine morality and intelligence must be one and the same thing Professor Fite meets manfully. He is willing to stand on the Socratic ground that a truly wise man perforce is a good man. To this *credo* there could hardly be a new contribution, and in candor it should be admitted that one apparently must accept the view *a priori*, or quite give over the attempt to rationalize our morality. Consciousness must claim the entire field of morals on penalty of seeming otherwise a mere trespasser. On purely logical grounds it seems to us that Professor Fite's demolition of the altruistic hypothesis is complete. The very practical point that altruism may after all be a permanent and valuable element of a world that is and is likely to remain but partially rationalized he does not deal with; we presume he would at most admit altruism among tolerated provisional virtues which a perfected society will outgrow.

We have been unable to give more than a summary notice of this stimulating and important social discussion. The trenchant clearness and fairness of Professor Fite's dialectic will attract even those who differ most widely from his conclusions. We wish this eminently constructive work a wide reading.

Myths and Legends of the Pacific Northwest: Especially of Washington and Oregon. Selected by Katharine Berry Judson. With 50 illustrations from photographs. Chicago: A. C. McClurg & Co. $1.50 net.

Had there lived centuries ago on this huge continent a Sequoyah in each separate tribe we should have inherited priceless records of the enormous number of Amerindian legends, myths, stories, histories, which are now forever lost. In the smoky tepees, in the wigwams, the snowy igloos, the houses of every kind; in the camps and on the trails, winters and summers, nights and days, the original American propounded, expounded, and sang. He had his philosophy, his drollery, his religion. Indeed, he was not unlike other people of the world. Like them he believed in the supernatural, in the magic of the under-world, of the surface-world, and of the sky or "heaven"-world; and he invented through the ages innumerable fanciful tales by which he sought to explain the incomprehensible. These stories we call myths, and through them we may read much of the character and mental perception of this original American people. They were transmitted by word-of-mouth; hence the dearth of records.

Next in value to native records must come those by honest and painstaking students from the outside, of whom in recent years there has been, fortunately, a large number; consequently a great quantity of important Amerindian "literature" is now available, though it is not infrequently too literally transcribed for general reading, when it does not err in the opposite direction by assuming too completely a Caucasian polish.

In the present attractive book the author makes no claim to originality, but has drawn on absolutely authentic and accurate sources. The stories thus retold are given in simple, direct language, as far as possible in the style of the original narrator. The work is a welcome addition to the literature of the subject, adapted to children as well as adults, and it ought to be widely read. It will help to a better appreciation of the remarkable race who preceded us here, and who, until quite recently, were universally regarded by our saintly European blood as valuable only when dead.

The illustrations are from photographs and are, as a rule, well composed and well printed. The one entitled An Indian Madonna possesses excellent pictorial quality; it gives the poetic side of the Indian, which is by no means so unusual as superficial observers from railway platforms would have us believe. The picture of the Scaffold Grave is defective archæologically, for the reason that the corpse is in a box, and not wrapped as was the practice. The following extracts will show the style of these stories:

Long, long ago, in the days of the first grandfather, all men were at peace. The earth was so new that tall firs of the mountain were no larger than arrows. Many fish swam in Beautiful Waters and in Great River. Many deer were on the mountains; many ipo and camas roots in the valley. All Indians were happy.

Long ago in the Willamette Valley there lived a monster who made all the people afraid. It lived in a cave. At night it would come from its cave, seize and eat people and return to the cave in the morning. All night it would eat the people. Coyote heard of this monster and decided to help the people. Coyote was the cunningest and the shrewdest of all the animals.

Coyote is prominent in the myths of the whole West, and he does many extraordinary things. Sometimes he is very bad, sometimes good. This volume tells much about him. Those who have followed the delightful career of B'rer Rabbit may here compare the wisdom of Africa and of America.

Notes

Smith & Elder are issuing "The Last Galley; Impressions and Tales," by Conan Doyle, which deals with important crises of history, and A. C. Benson's "Ruskin: A Study in Personality."

Goddard Henry Orpen is publishing through the Oxford University Press, "Ireland Under the Normans, 1169-1216," in two volumes.

Gottfried Keller's "Seven Legends" is at last to appear in English. An authorized translation will be brought out by Gowans & Gray.

"The Woman's Book," which Messrs. Jack are bringing out immediately, is advertised as containing everything which a woman ought to know.

The Oxford University Press announces for publication in May "The 1911 Bible," which is the Authorized Version of 1611, with the text corrected and amended by American scholars.

Some of Sewell Ford's tales are to be issued in book form by Edward J. Clode, under the title "Torchy."

Henry C. Hansbrough, former Senator from North Dakota, has written a novel, "The Second Amendment," which is promised shortly by the Hudson Publishing Co. of Minneapolis.

D. C. Heath & Co. have in their list a "Two-Book Series of Arithmetics," by Bruce M. Watson, and a "Greek Grammar," by Dr. Gustave Simonson.

"City Government by Commission," a volume prepared by Clinton Rogers Woodruff, secretary of the National Municipal League, and "The Girl in the Other Seat,"

a novel by Henry Kitchell Webster, are among the forthcoming books of D. Appleton & Co.

Dr. William McDougall's new book, "Body and Mind," will be published by Luce & Co. before the close of this season.

Two volumes will be added this month by Charles Scribner's Sons to their Countries and Peoples series, "Belgium of the Belgians," by Demetrius Boulger, and "Turkey of the Ottomans."

This house also adds to the list of Baedeker's Guide Books "The Mediterranean," which deals with seaports and sea routes, including Madeira, the Canary Islands, the Coast of Morocco, Algeria, and Tunisia.

William Winter's volume of Scottish travel, "Over the Border," is announced for publication by Moffat, Yard & Co. early next month.

In the list of the same house are: "When the Red Gods Call," a romance of New Guinea, by Beatrice Grimshaw; "The House in the Hedge," by Ralph Henry Barbour; "The Substitute Prisoner," a mystery story by Max Marcin, and "When Mother Lets Us Play," by Angela M. Keyes.

Dodd, Mead & Co. have in hand Louis Joseph Vance's "Cynthia-of-the-Minute" and William Hamilton Osborne's "The Catspaw."

Several new volumes of fiction are announced by the Putnams, including: "The Claw," by Cynthia Stockley; "The Story of Quamin," by Mrs. William H. Drummond; "Down Our Street," by Mrs. E. Buckrose, and "The Revolt at Roskelly's," by William Caine.

Other new books which will be brought out by this firm are: "Old Indian Trails," by Mary Schäffer; "The Pioneer Irish of Onondaga," by Dr. Theresa Bannan, and "Indian Place Names of Long Island," by William Tooker, edited with an introduction by Alexander F. Chamberlain.

The value of field sports to savages is strikingly shown by Dean C. Worcester, secretary of the interior of the Philippine Islands, in the *National Geographic Magazine* for March. He takes his readers on an imaginary trip through the non-Christian provinces of Northern Luzon and describes the various dances and sports with which the natives celebrate his annual coming, and which he encourages in them as an outlet for their superabundant animal spirits. They have also caused "120,000 head-hunters to give up head-hunting and to leave their Christian neighbors in peace." The sport which excites the greatest enthusiasm is the tug-of-war. Each dance and sport described is illustrated by reproductions of excellent photographs taken by the author. Among the other contents are an account of a beautiful Mexican valley with gardens of world-wide fame laid out in 1762, and some notes on Southern Mexico by members of an expedition sent out by the Department of Agriculture to investigate the cotton culture of that region. There is also a full report of the speeches at the sixth annual banquet of the National Geographic Society of President Taft and the ambassadors of Great Britain, Germany, and Mexico. It was announced that the membership of the society had increased 21,000 during the past year and now numbered 74,000.

The creation of national parks in this country has awakened an interest in Europe which is showing practical results. A Naturschutzpark society, with headquarters at Stuttgart, has already acquired several large tracts, according to the *Annales de Géographie* for March, and is negotiating for more, for the preservation of the forests and animal life; and a Swiss valley was made a national park last year, the first in the republic. It also calls attention to the scientific exploration of the Adriatic now being made conjointly by Italy and Austria, having particular reference to the improvement of the fisheries.

Now that the New York State Library has been destroyed, and the Legislature has been asked for a million dollars for the restoration of its collections, many people who have known little or nothing of its activities are asking just what function this library has filled, or is designed to fill, in the educational work of the State. The following summary, condensed from a report published last year, may therefore be of interest: The State Library (1) Preserves and makes accessible to students the manuscript archives of the State; (2) Provides a large and highly organized reference collection for the free use of every student and institution in the State; (3) Maintains a special collection under expert management for the study of subjects of legislation, thus aiding in the enactment of wise laws; (4) Aids in the organization and work of study clubs throughout the State, by preparing for them helpful and consecutive courses of study, and by sending them special libraries on the subjects to be studied; (5) Sends travelling libraries to all communities applying for them; also to any school, club, grange, summer school, business corporation, or household not having suitable local library privileges (more than 40,000 volumes of travelling libraries were in the hands of readers at the time of the fire, and therefore saved); (6) Maintains an active propaganda through printed matter and field workers for the establishment and improvement of local libraries; (7) Supplements the resources of local libraries, thus giving to even the smallest and poorest of these a means of meeting the wants of their more serious readers; (8) Assists local libraries and their patrons in the selection of books, (a) by printing annually and distributing freely a carefully prepared and annotated list of the best books of the preceding year, (b) by sending to all registered libraries in the State a monthly select and annotated list of the best recent books, (c) by notes, lists, and suggestions as printed in its quarterly bulletin, (d) by the preparation and publication of numerous bibliographies on subjects of special interest, (e) by advice given through correspondence or on personal visits of its field workers; (9) As the agent through which State money is distributed to local libraries for buying books, it fixes standards of quality and service which all libraries must meet in order to receive the benefits of this fund; (10) Maintains a library school which has been and still is an influential factor in raising standards of library efficiency and in making the library an integral part of public education; (11) Maintains a library in raised letters for the free use of all blind persons in the State.

According to a statement in the *Irish Booklover*, Mr. Asquith has conferred a pension of £150 a year upon the poet and dramatist, W. B. Yeats.

In quick succession to the six volumes of the Centenary Edition of Dickens recorded last week, we have to announce a further issue, including "A Tale of Two Cities," "Great Expectations," "Dombey and Son" (2 vols.), and "Martin Chuzzlewit" (2 vols.). This authoritative edition is published by Chapman & Hall of London, and imported by Chas. Scribner's Sons.

In the wisdom of his middle years, Arnold Bennett delivers a message to the world. "The Human Machine" (Doran), like all good sermons, is designed at the outset to startle and throughout to preach, despite Mr. Bennett's disavowal of any such thing. It begins:

> There are men who are capable of loving a machine more deeply than they can love a woman. They are among the happiest men on earth. This is not a sneer meanly shot from cover at women. It is simply a statement of notorious fact. Men who worry themselves to distraction over the perfecting of a machine are indubitably blessed beyond their kind. Most of us have known such men. . . . Their evenings never drag—are always too short. You may, indeed, catch them at twelve o'clock at night on the flat of their backs; but not in bed! No; in a shed, under a machine, holding a candle (whose paths drop fatness) up to the connecting-rod that is strained, or the wheel that is out of centre. They are continually interested; nay, enthralled. They have a machine, and they are perfecting it. They get one part tight; then another goes wrong, and so on. When they are quite sure they have reached perfection, forth issues the machine out of the shed—and in five minutes is smashed up, together with a limb or so of the inventor's, just because they had been quite sure too soon. Then the whole business starts again.

He who out of his boredom (of marriage become prosaic and eternal; of recognizing that life's young dream has been realized and found wanting; or of discovering that an ideal tobacco-mixture does not exist) is regretting that he was born without a mechanical turn, because there is really something about a machine—such a one may take heart; Mr. Bennett has a word for him:

> It has never struck you that you possess a machine! Oh, blind! Oh, dull! It has never struck you that you have at hand a machine wonderful beyond all mechanisms in shed, intricate, delicately adjustable, of astounding and miraculous possibilities, interminably interesting! That machine is yourself. "This fellow is preaching. I won't have it!" Dear sir, I am not preaching, and, even if I were, I think you *would* have it. I think I can anyhow keep hold of your hutton for a while, though you pull hard. I am not preaching. I am simply bent on calling your attention to a fact which has, perhaps, wholly or partially escaped you—namely, that you are the most fascinating bit of machinery that ever was. You do yourself less than justice. It is said that men are only interested in themselves. The truth is that, as a rule, men are interested in every mortal thing except themselves. They have a habit of taking themselves for granted, and that habit is responsible for nine-tenths of the boredom and despair on the face of the planet.

That Mr. Bennett means heartily what he says is best attested by his willingness not seldom to be commonplace in expression. Indeed, one secret of his present popularity, we dare believe, is this very quality. There is in his writings a preponderance of sense and wisdom of the sort which might be imperilled by very picturesque utterance. This must be an agreeable change for those slightly laggard wits which find an instan-

taneous laugh at the lightning of Shaw and Chesterton too difficult.

A number of recent papers from the *Atlantic* by Dallas Lore Sharp, with one each from the *Outlook* and the *Youth's Companion*, have been gathered into a volume by the Houghton Mifflin Company. The first paper, "The Face of the Fields," gives its title to the volume, which has no unity other than the individuality of the writer and the fact that the papers all deal either with some phase of nature itself or with nature writing. The initial chapter takes a shot at Kipling, the character of which can best be shown by a brief quotation:

The wild animals that Hathi knew are more marvellous than the Wild Animals I Have Known, but Hathi's knowledge of Jungle law is all stuff and nonsense. There is no ogre, Fear, no command, Obey, but the wildest kind of a personal permit to live—joyously, abundantly, intensely, frugally at times, painfully at times, and always with large liberty; until suddenly the time comes to Let Live, when death is almost sure to be instant, with little pain and less fear.

As an illustration of the genuine humor of which the author is capable, the chapter on the Scarcity of Skunks easily takes the lead, while the appreciation of John Burroughs, in the sixth chapter, is of itself enough to establish a place for the volume among serious works of literary criticism. Burroughs, he holds, has established a new type, clearly distinguishable from that of the naturalist in Gilbert White, the mystic in Traherne, the philosopher in Emerson, the preacher, poet, egotist in Thoreau, the humorist in Charles Dudley Warner. With earlier nature writers the pen is always held by the naturalist, or the moralist, or the stylist, Burroughs for the first time, with a threefold and even emphasis, gives us "the essay whose matter is nature, whose moral is human, whose manner is strictly literary."

One of the most interesting as well as one of the most important collections of early Sanskrit short stories has been made accessible to the general public by the Rev. B. Hale Wortham in his "Enchanted Parrot" (London: Luzac), a translation of the "Çukasaptati," or "Seventy Tales of a Parrot." The "box arrangement," familiar to us from the "Arabian Nights" and the "Decameron," is given by the story of a parrot which keeps his mistress, whose husband is gone on a long journey, in the path of virtue by telling her each night, when she is resolved to seek consolation with a lover, a tale ending with a dilemma which the bird declines to solve until she has first promised to abandon her intention for the evening. Mr. Wortham has translated fifty-six of these stories, the remainder being scarcely *virginibus puerisque*, and he has also somewhat condensed the original of what he has selected. Unfortunately, his English fails to convey the Oriental atmosphere of his text, and his introduction is very meagre. He has not mentioned the Greek translation of the "Tales" by Demetrios Galanos (Athens, 1851), nor has he referred to the labors of Richard Schmidt, whose publications on the "Çukasaptati" began with his doctor's dissertation (Halle, 1890), and who has edited and translated both the shorter and the longer recensions of the text (eds. Leipzig, 1893, Munich, 1898; trls. Kiel, 1894, Stuttgart, 1899), besides writing an elaborate monograph on the longer version (Stuttgart, 1896). There is not even any reference to the fact that these two recensions exist, although they differ from each other in important details; and there is no allusion to the place of the "Çukasaptati" in the literature of India or to its importance in the literature of the world. Yet such importance it has. The "Tales of a Parrot" influenced, at least in part, the great fable-collection of the "Panchatantra"; it formed the basis of the Persian "Tutinamah"; and the transmission of its stories may be traced in the "Decameron," Straparola, the "Gesta Romanorum," Chaucer, and many other classics of European literature. Mr. Wortham's ability to do excellent work was evinced in 1886 by his translation of 200 quatrains of the Sanskrit poet Bhartrihari, with most helpful notes and parallels from other literatures; it is, therefore, the more disappointing to find so marked a decadence in the quality of his work on the far more important "Enchanted Parrot."

Gladstone achieved the peculiar distinction of making the budget as interesting as a novel, and Hartley Withers has acquired similar distinction in connection with the dry subject of "Stocks and Shares" (Dutton). He has not the profound originality of Walter Bagehot, but certainly no one employing the English language has since Bagehot's day written of Lombard Street and Capel Court with a surer and more diverting pen. "I am to speak of what all People are busie about, but not one in Forty understands," he says, quoting from "An Essay upon Publick Credit" published in 1710; and he does not state the case a bit too strongly. His message is a sane one: he sees the manifold tricks of the trade, and describes them with amiable cynicism, but is not betrayed by them into that captious criticism of the stock market so frequently encountered to-day. Like Bagehot, our author has preëminently the faculty of visualizing and vitalizing; it confronts one at every turn. Mr. Withers has a chapter on prospectuses, and here we read:

All prospectuses should be scanned in a spirit of jaundiced criticism, and with most pessimistic readiness to believe that they are speciously alluring traps laid by some designing financier to relieve the reader of some of his money. No allowance should be made, and benefit of the doubt should never be given to the prospectus. In fact, a large number of them are quite reasonable propositions put forward by quite honest men, but when they are of this kind they will, or ought to, stand the most skeptical scrutiny, and when they are not, it is a service to the community to put them as quickly as possible in the waste-paper basket. When they arrive by post or thrust themselves on your attention in the columns of the newspaper, your first instinctive thought should be that here is somebody wanting your money, and that he may be a descendant of Dick Turpin throwing back to his distinguished ancestor, and practising brigandage in a more modern and much less attractive form.

Behind the lightness of treatment which Mr. Withers accords his subject, there is a wealth of clear exposition, sound judgment, and a timely warning.

There is still such a dearth of good popular books in the field of American history that a cordial welcome should be extended to any work which embodies, in clear and readable style, the assured results of scholarly research. "The Siege of Boston" (Macmillan), by Allen French, the latest volume in the series of "Stories from American History," while not intended to supersede Frothingham's work on the same subject, makes use of a considerable amount of new material which has appeared in the sixty years since Frothingham wrote, and has distinctly the merit of readableness. The chief criticism to be passed upon Mr. French's work is that, being on the whole as good as it is, it ought in some respects to have been better. For example, it was undoubtedly wise to treat the siege, not as an isolated local episode, but as a part of the revolutionary movement; but an apportionment of space which brings us to the siege itself only after half of the volume has been spent, seems ill-contrived. Most readers too, we think, would be glad of a more detailed account of life in Boston during the Port Act and the siege. As a rule, the description of localities is general, rather than precise. Why, for instance, does Mr. French not tell his readers exactly the location of Gage's fortifications on Boston Neck, instead of leaving it to be set down somewhere between Back Bay and South Boston? A contemporary map of the old town and its environs, more informing than the bird's-eye view which faces page 127, would have been worth while. These are but minor blemishes, however, in a book which as a whole is well put together.

The compact volume, "Inheritance Taxes for Investors" (Boston News Bureau Company), by Hugh Bancroft, is a reprint of articles published in the Boston *News Bureau* in February and March, 1911. Its object is to show "investors how seriously they may be affected by the inheritance tax laws of every State in the country, as well as the one in which they happen to live." To indicate how the book may be used, the case may be assumed of X dying a resident of New York, leaving 10,000 shares of stock in the Chicago and Northwestern Railway Company. The list of corporations (at p. 126) shows this company to be chartered in Illinois, Wisconsin, and Michigan. The four States specified all have inheritance tax laws. Referring to these in sequence, and assuming the estate is to pass to collaterals or strangers to the blood, we find that New York will impose a tax of nearly 25 per cent. because the decedent was a resident and figured roughly on its graduated scale on a value of above one million. Illinois will impose a tax of 10 per cent., because it chartered the railway company; Wisconsin and Michigan will impose a tax of 15 per cent. and 5 per cent. for like reasons. A possible total of 55 per cent. is thus made up which these four States claim the right to appropriate of the New York resident's property. It is true that Michigan has not fully waked up to the means of making its collection on non-residents' estates effective, and that the Wisconsin law is being attacked as being ineffective or unconstitutional in the courts. But the condition exists and every estate has to reckon with it. The Pennsylvania law is first examined, and its fairness to non-residents emphasized as an "intelligent example." The chapter on Connecticut discloses the existence of a retaliatory law taxing estates of non-residents only if the States of which they were residents in turn tax the property of non-residents; certainly a reasonable system,

lending itself to an automatic adjustment in case other States will coöperate. Decisions by the courts revised to January 1, 1911, are inserted as foot-notes, and the principal stocks of companies chartered in each State are listed at the end of each paper, as well as tabulated at the end of the book. The book is well worth reading, and should produce definite results.

George Cary Eggleston, a newspaper man and an author of prominence, died last week in this city, at the age of seventy-one. He was born and educated in Indiana, and later was literary editor for six years of the New York *Evening Post*. He wrote a great many novels and books for children. Among the best-known are: "A Man of Honor," "A Rebel's Recollections," "The Warrens of Virginia," "The Juggernaut," "The American Immortals," "The Bale Marked Circle X," "Southern Soldier Stories," "Red Eagle," "The Master of Warlock," "The First of the Hoosiers," "Two Gentlemen of Virginia," "Blind Alleys," "A Daughter of the South," "The Last of the Flatboats," "Love Is the Sum of It All," "A Carolina Cavalier," and "A Primary History of the United States." He also compiled "American War Ballads."

The death is reported from Ottawa of Sir Henri Elzear Taschereau, aged seventy-four. In 1902 he was appointed chief justice of the Supreme Court of Canada, and he acted as the administrator of the government of Canada between the departure of Lord Minto and the arrival of Earl Grey. He was knighted in 1902, and summoned to the Privy Counil two years later. He was the author of numerous law treatises, and was a man of great activity up to within a few days of his death.

Science

Among the forthcoming science books of Cassell & Co. we note: "Practical Electricity," by the late Professor Ayrton and Thomas Mather; "Breeding and the Mendelian Discovery," by A. D. Darbishire," and "Astronomy for All," by Bruno H. Burgel.

The fifteenth International Congress on Hygiene and Demography will be held in Washington, September 23-28, 1912.

"Under the Roof of the Jungle" (Boston: L. C. Page & Co.), by Charles Livingston Bull, is a series of sketches of the animals in the wilds of Guiana. The author's aim is not a contribution to science, but simply to describe what he saw, and, when possible, to give the whole life-history of an animal, which almost always has a tragic end, for every creature is either attacking or being attacked. The only instance which he gives of man's part in the struggle for existence is that of a hunter of ibises, who, for the sake of their feathers, shot about thirty-five hundred on a little island off the coast the season he was there. Fanciful titles are given to some of the chapters as "the green dragon," meaning a lizard and "the sexton of the jungle," the bell-bird. We regret that there is no index nor list of scientific terms with their meanings. The numerous reproductions of the author's paintings and drawings are often very striking and interesting, and the whole book, from cover to cover, is attractive in appearance.

"The experience of twenty years since the first class of sanitary engineers was graduated in 1890 has led to the compilation of these pages ("Conservation and Sanitation," Boston: John Wiley & Sons, by the late Mrs. Ellen H. Richards) from notes prepared annually for each succeeding class. People are beginning to understand, writes Mrs. Richards, that "sanitation will *pay* as well as railroads and machine shops." The book is divided into two parts. The former deals with air as a neglected source; standards of air supply; wholesome air and the sanitary inspector; water supplies; municipalization of water works and their efficiency, economic and sanitary, which are synonymous; protection of water supplies as a conservation of natural resources; regeneration of a spoiled watershed (many cities have this to consider in making adequate provision for increase in population); interdependence of town and country · preparation of potable water; disposal of wastes likely to contaminate water supplies (the economical utilization of valuable material now going to the sea); and the community and the individual. These should be read by engineers and health officers; in fact, by every municipal official, for each is a health officer, whether he regards himself as such or not. Part ii contains discriminating laboratory exercises especially for inspectors. The author naturally gives much attention to the methods practised in and around Boston, but that is not unreasonable. The State of Massachusetts was the first to establish a State Board of Health (1869), and has been a leader in sanitary science ever since.

A striking illustration of the world's progress in recent years is to be found in Col. G. W. Goethals's illuminating address to the National Geographical Society on the Panama Canal, which was published in the society's magazine for February. He shows, with the help of many pictures, how wonderfully machinery has taken the place of hand labor. But to those who are familiar with the history of the construction of the Suez Canal the most interesting indication of progress is seen in his testimony to the "enthusiasm and loyalty" of the workers. "Each man has a personal interest in the work, and seems imbued with the idea that the success of the enterprise depends on him." Interesting, too, is his account of the way in which these 35,000 employees, 2,000 of whom came from Spain and Italy last year, are housed and fed in such a way as to maintain a desirable state of health. The other contents of the number are a vivid description, with many illustrations, of the snake dance, the greatest religious ceremony of the Hopi Indians, by Marion L. Oliver, and an account, by F. V. Coville, of his four years' experiments in cultivating the wild blueberry.

The appearance of a new edition of the "The Jukes" (Putnam) will be welcomed by all who are interested in the study of social problems by thoroughly scientific methods. This book, as some readers will recall, was the outcome of an inquiry begun by R. L. Dugdale in 1874, when, in the course of prison inspection, his attention was directed to the criminal career of a certain family which through him was to acquire a world-wide pseudonymous reputation. Concerning this family information was gathered from the records or from the personal recollections of reputable neighbors, so that the essential facts were available for the examination of the lives of 709 persons, and these were investigated and tabulated from many points of view. By a certain liberality of estimation, not altogether convincing, it was inferred that quite similar results would be obtained were collateral lines included, making in all 1,200 persons. On this assumption the conclusion was reached that the damage done by this family in seventy-five years might be estimated as about $1,300,000, with no allowance for the load of poverty and crime and disease growing out of the vice and debauchery of those directly included in this estimate. This study first appeared as a part of the thirtieth annual report of the Prison Association of New York, and at once attracted much attention. It was republished in book form and passed through several editions, that of 1891 being called the fifth. Dugdale had died in 1883 and the book has long been out of print. The new edition, by some oversight called the fourth, is evidently reprinted from the same plates as that of 1891, with the omission of the introduction by W. M. F. Round, for which a "foreword," by Dr. Elisha Harris, is substituted. In fact, the only really new matter seems to be the brief introduction by F. H. Giddings, in which he seeks to correct what he regards as a widespread error of attributing to Dugdale too much reliance upon heredity in discussing the results of his study; but Dugdale was himself in part responsible for this judgment, for his sub-title states that his book is "a study in crime, pauperism, disease, and heredity," and his text (as for example, p. 65), while laying stress on environment, is not free from the inference that environment may even lead to heredity.

Under the title of "The Fine Art of Fishing," the Outing Publishing Company sends us a little volume made up from contributions of Samuel G. Camp to *Outing, Recreation,* and *Country Life in America*. The angler will find nothing strictly new in these chapters, but "the extension of the limits of human knowledge" is not the *sine qua non* of an acceptable thesis in this field of research. The one thing positively unendurable in angling literature is the work of the mere compiler whose bungling hand at once betrays the fact that he has never "been there himself." Anything that Mr. Camp writes, however, will be read for its positive merit, and this volume is a worthy companion to his "Fishing Kits and Equipment," noticed in these columns a year or two ago.

Some weeks ago we commented not altogether favorably on the "Science of Living," by Dr. W. S. Sadler. We have now his little book on the "Cause and Cure of Colds" (McClurg), which may be heartily commended as good reading for the intelligent layman. Man is unquestionably the catarrhal animal, but the advice here given, with perhaps a little more reserve in the approval of nasal douches, will do much to ameliorate his troubles and to prevent them from becoming chronic even if they may not be altogether avoided.

Georg Helm's "Die Grundlehren der Höheren Mathematik" (Leipzig: Akademische Verlagsgesellschaft) may be adequately described as an excellent textbook of differential and integral calculus with em-

phasis on applications specially to geometry. Its contents may be found in any one of scores of similar books in every scientific language.

In the "Dawn of the Fourth Era in Surgery" (W. B. Saunders Co.) are reprinted a dozen short articles by Dr. Robert T. Morris. They treat of various surgical matters, more particularly appendicitis, and one of the articles has the title of the book. The eras are: that of heroic surgery (Hippocrates), the anatomical (Vesalius), the pathological or antibacterial (Pasteur and Lister), and that of conservation or the physiological era (Metchnikoff and Wright) —quite harmless distinctions. The main contention of the author appears to be that speed in the operation is important, because it aids in the preservation of the protective powers of the patient on which his ultimate recovery must depend.

Drama

"*Der junge Medardus.*" By Arthur Schnitzler. Berlin: S. Fischer.

Of Austria's representatives in contemporary German literature Arthur Schnitzler, less robust and emphatically national than Hermann Bahr and more refined and sincere than Hoffmansthal, is an interesting and sympathetic figure. He is not unknown to American audiences, for his "Liebelei" ("Flirtation") had some success a few years ago, and his "Green Cockatoo" is remembered from a more recent season. Far more ambitious than any of his previous works, his latest play, which had its initial performance of five hours' duration at the Vienna Burgtheater, is calling forth considerable comment. The author has labelled it not an historical drama, but "eine dramatische Historie," an appropriate term, for the work is a series of dramatic episodes in two actions but loosely held together by the hero, a sort of Austrian Hamlet. The play deals with the resolve of Medardus Klähr—whose sister, having been ruined by the son of a French pretender, has with him ended her life—to take vengeance by ruining the sister of the dead man. Medardus becomes faithless to his vow by falling desperately in love with this fascinating young woman, who plays with his passion only to make of him an obedient tool in the service of her family's cause; for the pretender's party plans to do away with Bonaparte, who is expected in Vienna. Finding Medardus less obedient than she hoped, she insinuates herself into the Emperor's favor until rumor makes her one of his mistresses. When Medardus finally goes to Schönbrunn to do her bidding he hears of the rumor, and as he meets her on the steps of the castle, not knowing that she comes Judith-like with murderous intent, he is overcome with jealousy and kills her.

To present an absolutely logical development of the hero's character, Schnitzler has prolonged the play beyond this its obvious end. For when Bonaparte learns of the woman's intention he regards Medardus as his saviour and would bestow upon him his favor; but Medardus, true to his standard of honesty, admits that he, too, had come to Schönbrunn determined to kill the Emperor. He will not even promise that he will make no further attempt, since no one knows the course of human destiny. Medardus is taken into the prison-yard and shot, but the bereaved mother is told that the Emperor has ordered him to be buried in sanctified ground with all military honors, who was the war's last and strangest hero.

The panorama which the play presents is animated and full of meaning. As the scene shifts from the bookstore of the Klährs, tumultuous with the vague and impotent ravings of a people stirred rather by their emotions than by a clear conception of facts, to the villa of the royal claimant agitated with the burrowing and the plotting of political intrigue, and from there to the park of Schönbrunn crowded with people elated over the message of peace, the reader carries away not only a picture of the spirit of the period, but of the light-hearted and easy-going Austrians. Among the numerous *dramatis personæ*, Eschenbacher, the uncle of Medardus, stands out as the ideal of a sturdy, honest patriot and champion, while the French claimant, old, sightless, and weak of mind, is pitiably pathetic. Though not an historical drama, the work is large in conception, has strong dramatic moments and a distinguished style.

The translations of Strindberg's "The Creditor" and Marie von Ebner-Eschenbach's "A Man of the World," to be published by Richard G. Badger, are complete, not abridged as stated in our announcement last week.

William A. Brady, who aspires to be known as a Shakespearean producer, must provide his star, Robert Mantell, with a more capable company, or the latter will no longer be able to pose as a rival to E. A. Sothern in the legitimate drama. Mr. Mantell began an engagement in Daly's Theatre on Monday evening, appearing as King Lear, a character in which he has acquired some reputation. He was greeted by a crowded house, and his own personal performance, although marred by much artificiality and theatrical trickery, was often effective in passion and pathos, but the miserable character of his support made the general representation little better than a travesty. None of the players could speak blank verse properly, and only one or two of them exhibited the least notion of the proper rhythm or emphasis. In action, they were equally inefficient. As wretched as the exhibition was, the audience followed it with patience, and awaited the end, which did not come much before midnight. Evidently, therefore, there is in this city a demand for Shakespeare, but it will disappear if he is to be shown in such fashion as this. Edwin Booth contrived to dispense with the services of competent actors, but he was a genius. Mr. Mantell is a star of the second magnitude only, and cannot illuminate a whole entertainment.

The first of three performances of "Atalanta in Calydon" took place the other day in the Lyceum Theatre, London. Says the London *Times:*

It was in aid of the Poetry Society, but we fear that the cause of poetry will not benefit very much by it. "Atalanta," needless to say, is a poetical play, indeed, no play could well be more poetical and yet remain a play at all. Unfortunately, the general effect of this performance was to eliminate the poetry, and we were left with the problem—Take the poetry from "Atalanta" and what remains?

The "Passers-by" of Haddon Chambers, which has just been produced in Wyndham's Theatre, London, seems to be a pretty bit of sentiment, a long way removed from probability or real life. A wealthy young bachelor, about to be married, while entertaining a casual street loafer whom he had pitied, is surprised by the visit of a pretty young governess whom he had led astray some time before, and deserted. She tells him that he is a father, and produces the child, whom he receives with rapture. Afterward the loafer steals the baby, and the hero goes in search of it; entrusting the distracted mother to the care of his bride-to-be, who, of course, soon learns the truth. Instead of being outraged, this sympathetic young lady promptly resigns all her claim upon the hero in favor of her newly discovered rival, and all ends happily. The piece seemed to please the audience greatly, and is likely to prove a popular success. Gerald du Maurier and Irene Vanbrugh had the leading parts.

Augustus Thomas will soon go to London and will there attend personally to the arrangements for the presentation in that city and elsewhere in England of his admirable play, "As a Man Thinks." He wishes, if possible, to defer the performance there until John Mason is at liberty to play the character of Dr. Seelig.

Lewis Waller intends to revive "King Henry V" and "Othello"; and Miss Phyllis Neilson-Terry will appear as Rosalind in "As You Like It," at a series of morning performances at the New Theatre during the London season.

Denman Thompson, who made himself famous with his "The Old Homestead," died at his country estate in West Swanzey, N. H., last Friday. He was born in Girard, Pa., seventy-eight years ago, and adopted the stage when he was little more than a boy, making his first public appearance at the Howard Athenæum in Boston, in 1850. It was not until he was forty-two years old that his "Joshua Whitcomb," as the play was first called, brought him a wide reputation. In the play was one scene which was often omitted in later representations, but which only last year Thompson revived as a separate performance—that in which Joshua is praying in a garret by the bedside of a dying woman, when the latter's worthless son enters and begins to hurl abuse. Joshua arises from his knees, grasps

the intruder by the collar and the slack o' his breeches, and throws him out of the window. Then he kneels down and finishes his prayer.

Music

The Education of a Music Lover. By Edward Dickinson. New York: Charles Scribner's Sons. $1.50 net.

To those who fully understand music, nothing is more surprising and irritating than the way in which a large proportion of an audience often begins to applaud or talk just as soon as the solo voice or instrument stops, while the orchestra or piano is playing some exquisite interlude or postlude. One cannot but infer that those who thus rudely break in on the music must have understood and enjoyed no more than a mere fraction of the concerto or opera heard —in modern works one-fifth or one-tenth of its substance. Some of these persons, doubtless, vaguely realize this; they would be glad if they could enjoy an opera or a symphony as thoroughly as experts enjoy it, and books on how to listen to music are therefore in great demand.

The latest and best of them is this new volume by Edward Dickinson, professor of the history and criticism of music at Oberlin College. It is the result of many years of experience in initiating students into the mysteries of music. He has been surprised to discover how much of critical appreciation can be developed by an untrained music lover under judicious leadership. His experience has not been isolated. Instruction in "musical appreciation" has become a feature in conservatories, clubs, and private circles, and is now making its way into public schools, colleges, universities. As the author remarks, "colleges that are reluctant to establish technical courses in practical music, are beginning to see that the promotion of intelligent taste in music is as much within their province as the similar endeavor in respect to the kindred arts of painting and literature." His treatise will give a powerful stimulus to this movement, and it will doubtless be adopted as a text-book in many of our institutions of learning on which the truth is dawning that music is not merely an accomplishment and an entertainment, but one of the most potent means of training the mind. Careful listening to music is, as the author notes, "an exercise in mental athletics, and the ability, which grows with discipline, to hold the volatile thought in the firm clutch of the will is not the least of the serious music student's gains."

While maintaining that the primary task of the music lover who is anxious to emerge from the misty realm of sensation into the light of knowledge is to learn some of the secrets of musical construction, Professor Dickinson does not fall into the mistake, like one of his predecessors, of making his volume a mere treatise on musical forms. The essential thing is to hear good music over and over again, and for this reason he warmly welcomes the music-reproducing devices of our day, without which, in his opinion, courses in the history and criticism of music have little value. He warns students against the pedants who have "a morbid passion for analysis" and who cannot see that form is a means and not an end. In a chapter which cannot be too highly commended to musical critics as well as to students and amateurs in general, he shows how musical forms have become modified and more and more free. "Forms change but form remains." The value to the beginner of the study of forms is that it teaches him the unity as well as the variety in what he hears.

Rhythmic melody is what the untutored observe most easily in music. The difficulty is that as soon as they get away from the simplest tunes they are bewildered, finding themselves "utterly confused by the complex tone patterns which, in their displacement of accents, avoidance of cadences, their interweaving of melodic lines and harmonic masses, their cross currents and eddies of shifting tones, seem to avoid every semblance of order and system." The author explains by what means the listener can surmount this difficulty, and thus find a new world of pleasure opening within him. He then proceeds to show how the beauties of harmony can be made to reveal themselves to the serious-minded; they soon discover that music has more dimensions than they had supposed, and find that the pleasure derived from harmonies is "greater and more lasting than even the pleasure in melody and rhythm." The learner must form the habit of listening not only to the upper voice, but to the bass and the inner parts also; and for such training nothing is more useful than attending performances of chamber music by string quartets, because at these there are no dazzling displays of tone color or overwhelming masses of sound to distract the attention.

With true eloquence Professor Dickinson urges on the learner by describing the luxuries of musical sensation, which, unlike other luxuries, bring no surfeit. Having disposed of rhythm, melody, and harmony, he takes the pupil into the concert-hall to introduce him in turn to the Art of the Pianist and the Art of the Singer. In these chapters, as well as in the succeeding ones on the Problem of Expression, History and Biography, and Music and the Higher Law, there is again a great deal of matter of interest and importance not only to those who wish to become musical, but to those who already are so, or think they are. His remarks on changing traditions, on subjective and objective, on tonal beauty and phrasing, on *bel canto* and expression, on the "colorature mystery," on programme-music, on the personal element, are altogether admirable. To give an illustration: his description of what is usually called tempo rubato but what he more aptly calls flexible tempo, is more eloquent and illuminating than even Liszt's:

> A too rigid tempo gives a suggestion of friction, of resistance somewhere; a flexible tempo is motion as free, confident, and joyous as the flowing of winds or ocean tides. Those buoyant fluctuations of movement that we hear in a masterly performance, those unexpected contrasts, those languishing retards, those fiery accelerations, those delicate balancings of phrase against phrase, those affectionate lingerings over lovely modulations, those almost imperceptible delays as if to give a beautiful chord a little more time to resound along the corridors of the memory, those tender caressing familiarities, those impetuous defiances, all those bold liberties which prove the tone masses submissive to the player's will, the direct manifestation of his emotion—how eloquent, how illuminating they are!

During the first season at the Metropolitan Opera House, in 1883-1884, the price of a parquet seat was $7. Sixty-one performances were given and the loss to Henry E. Abbey was, according to his partner, John B. Schoeffel, "nearly $600,000." A year previous to this Adelina Patti had crossed the Atlantic to give a series of operatic concerts at $10 a seat; but the price was soon reduced to $5. During the seven seasons of German opera, the price of a parquet seat was only $3. There were comparatively few stars; but when, in 1891-1892, Abbey and Grau became the managers and brought over a galaxy, including Lilli Lehmann, Emma Eames, Scalchi, Albani, Van Zandt, Nordica, Jean and Edouard de Reszke, and Lassalle, orchestra seats cost $5, and that price has been maintained ever since. In regard to the announcement recently made that the price of such seats is to be $6 next season, it is to be hoped that the directors have not made a mistake. They justify the advance on the ground that the fastidious New York public now demands the best performances from every point of view, including orchestra, conductors, scenery, and stage management, which greatly enhance the cost of giving opera. This is true, but it seems to some observers that it would have been wise to leave well enough alone. Most of the performances this year have been well attended. Whether they will be next year will depend chiefly on the attitude of the management toward the stars. Will Caruso be able to sing? If not, it will be necessary to modify the repertory and make room for other favorites. If it were announced that Nordica, Eames, and Schumann-Heink were to be members of next season's company; that Gadski would be here the whole season, and that Renaud would appear a dozen times in "Rigoletto," "Don Giovanni," and "Boris Godounoff," it would doubtless act as a great encouragement to subscribers. It must be borne in mind that it is the purchasers of the most expensive seats who are the most insistent

on having all-star casts of the kind which Grau found so profitable.

The American pianist, Myrtle Elvyn, does not forget at her concerts in Germany that this country has also produced a great composer for the piano; in other words, she puts MacDowell on her programmes. The German critics are cordial in their praise of her playing.

King Alfonso of Spain is a great lover of good music. Last autumn he instituted a prize in the form of a subsidy of some $1,000 for the best orchestra, with a view of developing orchestral playing in the various cities; and a condition was affixed to the award that a composition by a Spanish musician must be played at every concert. It is his earnest wish that the orchestra of the Madrid Symphony Concerts should visit London next spring to give some concerts under Fernandez Arbos, who was concert master of the Boston Symphony Orchestra a few years ago. Once a year Arbos takes his orchestra on a tour of the Spanish provinces, Barcelona, Valencia, Cartagena, Alicante, Murcia, Bilhao, San Sebastian, and other cities being visited in turn—the whole series comprising forty-nine concerts.

The D'Oyly Carte Principal Répertoire Company is giving revivals of Gilbert and Sullivan's operas at the Coronet Theatre, Notting Hill.

Vienna is soon to boast of the possession of three new concert halls, equipped in the most modern fashion. They will form part of the scheme for the provision of the new buildings of the Academy of Music, the whole project involving an outlay of $1,000,000. One of the concert-rooms will afford accommodation for 2,100 persons, and will be the most spacious hall in the Austrian capital, the largest at present in existence, the Musik-Vereins Saal, seating not more than 1,675. There will be a platform large enough for a choir of from 600 to 800 singers, and "by a mechanical arrangement," it is stated, "the platform can be lowered if desired, so that the choir is cut of sight of the public."

The Tonkünstler Orchestra of Munich some weeks ago gave a series of concerts in Paris. At the first of them the audience numbered thirty-eight persons. The others were better attended.

Debussy's latest orchestral works have not aroused enthusiasm in Paris; but his "Pelléas et Mélisande" has been revived.

In a special series of sixteen historic Thursday matinées the Opéra-Comique, in Paris, is giving performances of operas that in their day were much in vogue. Among them are Pergolese's "Serva Padrone," Grétry's "Richard Cœur de Lion," Méhul's "Joseph," Adam's "Toreador," Auber's "Domino Noir," "Paër's "Maître de Chapelle," Thomas's "Caid," Massé's "Noces de Jeanette."

Madame Anne-Marie Judic, famous as a light opera singer, died last Friday at Nice, aged sixty. She made her début in Paris in 1867 at the Gymnase Dramatique, in "Les Grandes Demoiselles." In 1872 she became a star. Among her successes were "La Branche cassée," "Mamzelle Nitouche," and "La Belle au bois dormant."

Madame Neruda Halle, the great violinist, is dead in Berlin, aged seventy-two. She was born in Hungary, but achieved her fame in England as the wife of the Manchester conductor, Sir Charles Halle.

Alexandre Guilmant, the organist, whose death at the age of seventy-four was recently announced from Meudon, had given recitals with great success in various parts of Europe and in this country. He was a professor in the Conservatory at Paris, editor of a collection entitled, "Archives des maîtres de l'orgue," and a composer of distinction.

Art

Cassell & Co. promise for May 15 "Royal Academy Pictures and Sculpture, 1911."

G. K. Chesterton's "William Blake" (Dutton) is a pungent little book devoted almost exclusively to the man and his ideas, and deficient on the side of his art. Mr. Chesterton insists, rightly we think, upon the solidity of Blake's character. About him there is nothing of the soft and despicable enthusiast. The strain of morbidity, which is also admitted, is due not to weakness, but excess of strength. Blake, we are told, impaired his mind by a too curiously logical and external attitude toward his visions. The sense of reverence was short in him; he exploited his hallucinations until he impaired his judgment. A temperamental defect is well hit off as follows:

> Blake came out into the world a mystic in this very practical sense, that he came out to teach rather than to learn. Even as a boy he was bursting with occult information. And all through his life he had the deficiencies of one who is always giving out and has no time to take in. He was deaf with his own cataract of speech.

On the positive side Mr. Chesterton emphasizes Blake's essential rightness on most issues of art and morals. Here good use is made of the controversy with Stothard over the print of The Canterbury Pilgrims. Stothard had treated the theme as a masquerade, emphasizing its quaintness and denying it human value. Blake saw serious folk upon necessary business for their souls' good:

> Blake . . . was in the tradition of the best and most educated ideas about Chaucer, Stothard was the inheritor of the most fashionable ideas and the worst. The whole incident cannot be dismissed without its moral and effect for all discussions about the morality and unmorality of art. . . . In the future the fastidious artists who refuse to be anything but artists will go down in history as the embodiment of all the vulgarities and banalities of their time. People will point to a picture by Mr. Sargent or Mr. Shannon and say, "See, that man had caught all the most middle class cant of the early twentieth century."

One who already knows Blake well will read this book with enjoyment. For a novice essential information is missing. One would like to be told of the actual manufacture of those marvellous autographic books. Nor is the eminently Chestertonian dismissal of the prophetic books as containing a comprehensive scheme of the universe "only nobody could comprehend it" either satisfactory or illuminating. The Flaxmanism of Blake again is much exaggerated. Theoretically, Blake loathed loose and suggestive methods, but he practised them when they served his turn. Within a page of Mr. Chesterton's assertion that Blake is merely a topsy-turvy Flaxman is the mysterious cut of The Little Black Boy. On the whole the book is a creditable addition to that excellent series, "The Popular Library of Art."

"Eugène Carrière" (A. Colin: 280 pages, with 8 phototype plates 3.50 francs), by Gabriel Séailles, is an "essay of psychologic biography" of an artist who persisted for a lifetime in his narrow, but true conception of art, by a friend who has an equally narrow and exclusive philosophy of life. The keynote is sounded from the start: "The true life of an artist is his inner life." Those who have tarried before Carrière's pictures, impervious as they are to the populace, will be most attracted by the sixty pages on his technique. "Of color Carrière keeps only its light and shade; but his eye is marvellously sensitive to their gradations and accords." Evidently, eyes not marvellously sensitive must be resigned to not seeing the artist's subtle vision. The story of the years of apprenticeship and struggle, and the personal letters are open windows on an inner life which also seems to have eliminated all but the light and shade from the world's color, contemplating resolutely shadows for real men. Now the shadow also is a phenomenon of the real. Is it not, perhaps, Professor Séailles's philosophy which makes us long in such a life to hear one toot from Nietzsche's more human trumpet?

In the course of excavations at Welwyn, Hertfordshire, England, two prehistoric graves were discovered which contained objects of great importance. Among these were several amphoræ, some fine implements of iron, and a beautiful Greek cup in silver gilt, richly chased. The date of the graves is considered to be the first century B. C. The interest of the discovery lies in the fact that it implies an early connection between the ancient Britons and the civilized nations of the Mediterranean, such as has not been fully realized before.

William Keith, the artist, died a week ago at his home in Berkeley, Cal. He was born in Aberdeenshire, Scotland, in 1839, came to America when he was about twelve years old, was apprenticed to a wood engraver in New York, and worked for some time on *Harper's Weekly* and *Harper's Monthly*. In 1859 he removed to California and soon began to use water colors. Ten years later he went abroad for study, and since then has been back and forth a dozen times. His reputation was made by his landscape paintings. His ideas on art were as interesting as his pictures, though it is hard to tell how thoroughly he believed in them, in his notion, for instance, that the senses in art may be interchanged and that the sound of bells can be at least suggested in a picture.

Archæology has again suffered a severe loss in the death of Prof. Dr. Reinhard Kekulé von Stradonitz, who died in Berlin, March 22, at the age of seventy-two. Dr. Kekulé was both professor of archæology at the Berlin University and director of the Archæological Museum in Berlin. He was the author of many important works, of which the following are the most important: "Die Balustrade des Tempels der Athena-Nike in Athen," "Die antiken Terracotten," "Beschreibung der antiken Skulpturen in Berlin," and "Die griechische Skulptur." He has also written numerous shorter articles in the various archæological periodicals.

Finance

TWO CONTRASTING MARKETS.

It is quite possible that the next really striking chapter of events financial will be opened at London; indeed, it may be said that the story has begun already, and in a way that should cause some astonished interest on the part of people who have so long been talking of England's financial and industrial decadence. Absorbed in contemplation of their own financial apathy, our people are only beginning to awake to the fact that the boom now in progress on the London Stock Exchange and in English trade has reached sensational dimensions. Only a little time ago, the oracles of Lombard Street and the London financial critics were explaining dolefully how prosperity must inevitably halt while the Liberal ministry was pressing its social projects, and the British constitution, as the popular phraseology of the day described the situation, was in the melting-pot. But financial markets sometimes have a way of moving in response to more tangible considerations than those of politics. Within a single week, we have had a wholly unparalleled monthly record in England's foreign trade, a volume of Stock Exchange transactions which similarly passes precedent, and a day when exchange of checks reached the highest figure in the history of the London Clearing House. These are not altogether faint reminders of our own 1901.

This foreign situation calls attention sharply to one of the most curious paradoxes of the day—the mutual attitude of financial New York and financial London. Every one knows that American markets and American trade have sunk into almost complete stagnation. Wall Street calls it industrial depression, and in spite of the rise in opera seats and cotton, the country certainly feels poor. Yet it is this very country which is lending capital by the tens of millions in Lombard Street—acting, in short, as one of the bankers for a market and a trade movement, on the other side of the Atlantic, which are breaking records for activity.

How much of this money, which our bankers are putting out in London because they cannot lend it profitably here, is real American capital and how much is borrowed European money lent out on the market whence the borrowers raised it, is a somewhat puzzling question. Our "foreign balance" clearly results from two very different operations—the floating of railway loans abroad, of which the proceeds are not required immediately, and the sudden and rather sensational return of our own external trade from the lowest merchandise export surplus in a dozen years to as large an excess as in the days when our high international prosperity began. But so far as concerns ownership of these great reserves of capital, now being placed so largely at the disposal of financial London, the case is the same whatever their origin may have been.

It was in the early months of 1901, when New York was similarly lending out capital in London—when our banking houses subscribed to $200,000,000 of the British government's Boer war loans, and for some of them dealt direct with the English Exchequer—that the amateur economists of Wall Street began to talk of New York displacing London as the financial centre of the world. The world has moved since then, and Wall Street itself has learned a good deal more about international finance. It has seen the same foreign banks and banking houses taking a very different attitude toward Wall Street, and Wall Street itself acting as the central money market of the world would hardly act. Not only have we lived through 1906 and 1909, but within a year we have seen our financiers stretching their hands imploringly toward the European money market, asking for help to preserve us from destruction.

Europe, perhaps with the smile that came from longer experience in such things, cheerfully granted the request—though at a highly profitable price—and now comes this seemingly extraordinary change. Exactly what does it mean, in the broad and world-wide sweep of economic events?

Perhaps it means, for one thing, that the accumulated free capital of the world, under the guidance of the great international houses, knows no political or geographical boundaries, but passes from nation to nation as opportunity for its profitable use develops. It rushed into the United States during 1901, and it was well able to do so, because, at the very moment of our abounding financial prosperity, England's war depression and the extensive German liquidation released on a prodigious scale the capital previously tied up in those markets. In 1896, it had moved in exactly the opposite direction, when financial and industrial depression in this country was releasing the capital for which there was high demand in England's booming markets. What we are seeing to-day is a repetition of 1896; England is perfectly able to employ, in its prosperous trade and speculation, all the money which has been expelled from the channels of American industry by the depression of the season.

These are altogether normal incidents in the economic movement on the grand scale. In the wide diversity of a season's industrial conditions throughout the world, one market can almost always profitably use the loanable fund for which another has no need. It is only in years like 1905 and 1906 that the process becomes in all respects abnormal, and it is so on those occasions because all the nations of the world are clamoring simultaneously for capital to use in further exploitation of values, when there is not enough free capital in existence to satisfy all of them. It is after such periods that the world-wide credit crises come.

But the aspect of the case most interesting to the American market now is, how long we are reasonably to wait before the international movement is again diverted in our own direction. One of the incidental teachings of the history of finance is that when the world's capital reserves are for good and sufficient reasons converged upon one market, that market overdoes things; and the hour of its excesses is very apt to be the hour when capital takes its flight to somewhere else. It may be so on the present occasion with the booming English market, as it was in our own at the culmination of affairs in 1901. This is one consideration, not wholly devoid of interest in its possible application to the American situation later on.

Kellogg's The Animals and Man

By VERNON LYMAN KELLOGG, Professor in Stanford University. 495pp. 12mo. $1.25.

This book has been written and arranged from the point of view of a biologist intent on making our knowledge of the make-up and life of the lower animals help in understanding human structure and physiology and in contributing to human welfare.

Prof. G. H. Parker, Harvard University:—The book impresses me as an unusually good reading text for elementary work, and brings out so well man and his relation to other animals that I wish the title had been "Man as an Animal." I shall be glad to recommend it in the direction where such a book seems needed.

THE NERVOUS LIFE

By **G. E. Partridge**, Ph.D.

12mo. Cloth. $1.00 *net.*

Bad nerves are our national disease.

To preserve good nerves and cure nervous disorders are the aims of this practical, yet scientific, book, which tells the nervous man—especially the hard-worked man of sedentary ways—how, specifically, to order his life, how to eat, drink, sleep, and exercise, in order to keep or recover his physical well-being.

THIRD EDITION NOW READY
JOHN BROWN: A BIOGRAPHY FIFTY YEARS AFTER
By OSWALD GARRISON VILLARD
Some Tributes to this Remarkable Historical Work

Philadelphia PUBLIC LEDGER. "A tremendous book; more thrilling than any book of fiction, powerful in its appeal, and which, while it is written soberly, as befits history, by the very nature of the narrative, often rises to the highest dramatic level."

THOMAS WENTWORTH HIGGINSON. "I can only say after reading from first to last its more than 700 pages that I have never encountered anything this side of Gibbon's 'Rome' which has made me feel more the personal power of a single work."

JOHN T. MORSE, Editor American Statesmen Series, in ATLANTIC MONTHLY. "Perhaps in thus dramatically fashioning his volume, Mr. Villard obeyed an instinct rather than acted upon a preconceived plan; that is often the case with great work, where a writer's feelings are deeply enlisted. Be this as it may, the merit and charm are none the less; he has seized well a splendid opportunity and has written one of the great biographies of our literature."

HORACE WHITE. "In my judgment a contribution to American literature to take rank with the very best historical writing of our time or any time. The only impartial history of the Kansas war."

ST. CLAIR McKELWAY in the Brooklyn EAGLE. "A biography replete with facts and marked by courage and candor, learning and justice."

Portland OREGONIAN. "The most valuable and comprehensive biography issued this season, and the best and most candid estimate of John Brown."

W. E. CONNELLEY in the Topeka CAPITAL. "The unprejudiced student and seeker for truth will herald the book as a great contribution to American history."

Des Moines CAPITAL. "More powerful in its appeal, more dramatic than any book of fiction, is this wonderful biography of John Brown."

The North Carolina REVIEW. "In this biography Mr. Villard has touched high-water mark. The book is a delight to the reader for many reasons. Full of life and movement, . . . written in an attractive and scholarly style, full of sympathy and yet without any loss in accurate presentation, it sets a new standard for biographical efforts."

Baltimore AMERICAN. "While the book has popular features in that it is entrancingly interesting, its scholarship is of the highest order and its style reminds one a little of Anthony Froude. . . . Mr. Villard has illustrated in this book the finest ideals of literary conception and execution."

London TIMES. "It is scarcely likely that any later writer will be able either to add anything of importance to Mr. Villard's collection of material or to better his interpretation of the whole story. . . . It at once becomes the standard, and probably the final authority on its theme."

Washington (D. C.) STAR. "Mr. Villard draws a compact, vivid, historic picture of the terrible focussing of this period upon our Civil War. Straight and clear in its literary way, this biography is a marvel of research and fair-mindedness."

HENRY WATTERSON in Louisville COURIER-JOURNAL "No fault may justly be found with Mr. Villard's telling of the story. It is minute and lucid, altogether fair and unvarnished."

Burlington (Iowa) HAWKEYE. "It is a book which will take a place in the library of every well established home in this part of the country."

First Edition, October 1st; Second Edition, November 21st; Third Edition, March 1st

LONGMANS, GREEN, & CO.'S NEW BOOKS

A History of Wales from the Earliest Times to the Edwardian Conquest

By JOHN EDWARD LLOYD, M.A., Professor of History in the University College of North Wales, Bangor. 2 vols. 8vo. pp. 380+468. $6.00 net.

In this work the story of Wales is told in detail down to the struggle in which the country lost its independence. Prehistoric Wales, Roman Wales, the early institutions of the Welsh, the political divisions of the country, the Norman invasions and settlements, and the achievements of the more powerful princes are successively described. Special sections are devoted to the history of the Welsh Church. The relations between England and Wales are traced at each stage, and the reaction of Welsh upon English history is illustrated.

The History of Trade Unionism

By SIDNEY and BEATRICE WEBB. With Map and full Bibliography of the Subject. New Edition, Tenth Thousand. 8vo. $2.60 net.

This Edition has a new introductory chapter dealing at considerable length with the situation created by the Osborne Judgment, the principal industrial conflicts of recent years, and with the development of Trade Union constitution and function during the past two decades.

On the Theory of the Infinite in Modern Thought:
Two Introductory Studies

By E. F. JOURDAIN, Doctor of the University of Paris, Vice-Principal, St. Hugh's Hall, Oxford. Crown 8vo. $0.75 net.

John Merridew

By FREDERICK ARTHUR. Crown 8vo. $1.35 net; by mail, $1.50.

John Merridew is a typical, thoughtless, sport-loving Englishman, and the idea of the book is to show how his character developed for the better, under the political, religious, and social influences that are described in the story.

"A stirring, sensational novel which grips the reader's attention."—*The Pall Mall Gazette.*

"It is an excellent story, full of the Italian atmosphere, with exciting moments and a genuine sentiment that makes for the romantic spirit. Criticism apart, we have enjoyed it extremely."—*The Sunday Times.*

Individualism
Four Lectures on the Significance of Consciousness for Social Relations.

By WARNER FITE, Professor of Philosophy in Indiana University, Author of "An Introductory Study of Ethics." Crown 8vo. pp. xx+301. $1.80 net; by mail, $1.92.

" . . . . . Prof. Fite's study is of particular interest to students of philosophy, for he takes issue with Professor Royce, Prof. Dewey and other present-day philosophers on certain basic concepts, but the more general reader will also find the work helpful in getting his bearings as an individual and a member of society. Something of Nietzsche's robustness and self-respect, without his ruthlessness, and of the Utopian's idealism, without his mysticism, are discernible in the philosophy of life here set forth."—*Springfield Republican.*

Dublin University Press Series

A History of the Theories of Aether and Electricity, from the Age of Descartes to the Close of the Nineteenth Century

By E. T. WHITTAKER, Hon. Sc.D. (Dublin), F.R.S., Royal Astronomer of Ireland. 8vo. pp. xvi+476. $4.50 net.

CONTENTS:—1. The Theory of the Aether in the Seventeenth Century; 2. Electric and Magnetic Science, prior to the Introduction of the Potentials; 3. Galvanism, from Galvani to Ohm; 4. The Luminiferous Medium, from Bradley to Fresnel; 5. The Aether as an Elastic Solid; 6. Faraday; 7. The Mathematical Electricians of the Middle of the Nineteenth Century; 8. Maxwell; 9. Models of the Aether; 10. The Followers of Maxwell; 11. Conduction in Solutions and Gases, from Faraday to J. J. Thomson; 12. The Theory of Aether and Electrons in the Closing Years of the Nineteenth Century; Index.

An Anthology of Modern English Prose (1741 to 1892)

By ANNIE BARNETT and LUCY DALE (late Scholar of Somerville College, Oxford). Crown 8vo. $1.25 net.

New Ideas on Inorganic Chemistry
Translated, with the author's sanction from the second German edition, by Edgar Percy Hedley, Ph.D., A.R.C.Sc.I.

"The most comprehensive and suggestive study of the subject published in years."—Detroit News.

War or Peace

BY

HIRAM M. CHITTENDEN, U.S.A.

" 'War or Peace' furnishes a veritable arsenal of weapons for assault upon the international practice of war preparation."—*Philadelphia North American.*

"The book is of peculiar timeliness, in view of the fact that the question of the nation's preparedness for war has been brought up in congress and in current magazines in such sensational fashion. He writes in a most interesting manner, and while his book would be a useful compendium for the debater, there is nothing dry or smacking of the 'handbook' about it."—*Burlington Hawk-Eye.*

"A comprehensive and suggestive study of the subject and a valuable contribution to the world-peace movement."—*Buffalo Express.*

"General Hiram M. Chittenden's new book, 'War or Peace,' is perhaps the calmest, sanest, and most exhaustive analysis of the war humbug that has ever been written. All of the sanctions of war commonly advanced by militarists are exploded in this book, calmly and dispassionately, not by a dreamer, but by a brigadier general, retired of the United States Army."—*The Graphic* (Los Angeles).

APPLETON'S NEWEST BOOKS

Educational Problems

By G. Stanley Hall, Ph.D., LL.D.

President of Clark University. Author of "Adolescence," etc.

Dr. Hall's important work is nearly ready. In two volumes he gives to the public the results of his lifelong study of educational problems. The scope of the work is wide and ranges from the kindergarten to the high school, and deals with problems not only of the school and intellect, but of the moral, religious and social education and shaping of the child into the man. The author believes that we need a great educational revival all along the line, and that it already has begun, and he strikes out in the lines of various reforms that are now impending. *Ready May 5. Uniform with "Adolescence." Two vols. Cloth, 8vo, $7.50 net.*

The Training of Children in Religion

By George Hodges, D.D.

Dean of the Episcopal Theological Seminary at Cambridge.

A wise and practical guide for parents, guardians, Sunday-school teachers, clergymen, and all interested in the moral welfare of youth. A sympathetic knowledge of child nature, and a broad appreciation of the difficulties in treating it, has enabled the author to furnish practical suggestions on such subjects as when religious teaching should begin, church attendance, the influence of example in the adult, the best form of prayers, the guidance of the child's growing moral nature, the use of Sunday for the child, the necessary qualities and duties of the Sunday school teacher, etc. *12mo. Cloth. $1.50 net.*

The Obvious Orient

By Albert Bushnell Hart, Ph.D., LL.D.

Professor of the Science of Government at Harvard University.

The title which Dr. Hart has chosen for his new volume is an admission that, no matter how industrious he may be, no one can learn all there is to know of the most ancient and inscrutable of the continents in an eight months' experience. His book, however, reflects much more than surface impressions. He had unusual opportunities to observe and investigate the actual workings of government and the social systems in Japan, China, and the Philippines; and his comments upon the bewildering and picturesque detail of Oriental life are entertaining and illuminating. *12mo. Cloth. $1.50 net.*

The Social Direction of Human Evolution

An Outline of the Science of Eugenics

By William E. Kellicott, Ph.D.

Professor of Biology at Goucher College.

This volume is a study of the present status of that science which has for its aim the improvement of the innate characteristics of the human race; which aims to produce a more healthy, more vigorous and more able humanity. It is believed that the publication of this book will mark an epoch in the progress of this science. The author divides his subject into these three headings: The Sources and Aims of the Science of Eugenics; The Biological Foundations of Eugenics; Human Heredity and the Eugenic Program.

12mo. Cloth. $1.50 net.

Extinct Monsters and Creatures of Other Days

By Rev. H. N. Hutchinson, B.A., F.R.G.S.

This popular account of the larger forms of ancient animal life has been thoroughly revised to include the recent discoveries and advances in Paleontology. Originally written as two books, the material is now combined into one volume covering nearly all of the monsters of early days of which anything is known—the dragons, the great fish lizards, the mastodon, mammoth, dinosaur, and elephantine monsters, the ancestors of the horse, etc., etc. *New Edition, Revised and Enlarged. Profusely illustrated. 8vo. Cloth. $3.00 special net.*

Property Insurance

By Solomon S. Huebner, M.S., Ph.D.

Professor of Commerce at the University of Pennsylvania.

A treatise on fire insurance, marine insurance, corporate surety bonding, title insurance, and credit insurance, with copies of the leading forms and clauses. The principles and the practice upon which the property insurance business is based are clearly outlined, and the book should prove of value and interest to insurance agents and brokers, investigators, students, shippers, and large holders of property.

12mo. Cloth. $2.00 net.

Among Important New Macmillan Books

By **Professor E. R. A. Seligman,** *Columbia University*

THE INCOME TAX

"One of the most brilliant presentations of this subject that has been offered to the American public. In fact, one of the greatest questions of the day is here discussed with such force and clearness that the book forms so important a study of one phase of taxation that it cannot be neglected by the thoughtful student . . . it represents a compilation of a vast amount of material which has probably been accumulated by the author for several years. And yet it comes to us with a freshness and vigor that make its perusal an interesting pleasure. . . . This volume is worth the serious perusal of every student and every business man."—*The United Banker.*

Cloth, 8vo, $3.00 net; by mail, $3.20.

By **Professor Irving Fisher,** *of Yale University*

THE PURCHASING POWER OF MONEY

A book "by an expert in which the exact science of finance finds place, along with interesting suggestions of remedies for some common financial troubles," says the *New York World.* A study of the increase of prices between the years 1896 and 1910, and of the question whether the price-level is controllable.

Cloth, 8vo, $3.00 net; by mail, $3.20.

By **Mr. Henry Osborn Taylor,** *formerly of Columbia University*

THE MEDIAEVAL MIND

A History of the Development of Thought and Emotion in the Middle Ages

A work which sets forth directly from the mediæval writings, the emotional and intellectual growth of that long period which the educated world no longer regards as stagnant or altogether unprogressive.

In two 8vo volumes, $5.00 net; carriage extra.

By **Professor Henry C. Sherman,** *of Columbia University*

THE CHEMISTRY OF FOOD AND NUTRITION

The purpose of this volume is to present the principles of the chemistry of nutrition with special reference to the food requirements of man and the considerations which should underlie our judgment of the nutritive values of food, which is here considered chiefly in its nutritive relations.

Cloth, 12mo, 355 pp.; $1.50 net.

By **George Brandes** **FERDINAND LASSALLE**

The literary portrait of a man whom his friends and enemies agree to consider an historical personality of great importance. It is as fascinating in its way and more broadly balanced than George Meredith's better-known fictional portrait of this social democrat whose restless career ended in profound catastrophe.

Cloth, 8vo, $2.00 net; by mail, $2.10.

By **Professor William Lyon Phelps,** *of Yale University*

ESSAYS ON RUSSIAN NOVELISTS

By the Author of "Essays on Modern Novelists"

Each essay is "well-balanced and possesses no small measure of analytical power which enables us to see clearly its object," says the *Boston Transcript.*

Cloth, $1.50 net; by mail, $1.60.

Gustav Frenssen's *great novel* **KLAUS HINRICH BAAS**

"A significant study vividly done." "There is a sturdy sincerity in this story of a man who is fighting down the worst in him and bringing to fruit the best of his dreams which places the book among the notable novels."

Cloth, $1.50.

There will be reviews of recent text-books.

4,000 extra copies will be mailed to Professors in the Universities and Colleges throughout the United States.

Usual Rates for advertising.

THE TREATMENT OF RELIGIOUS SUBJECTS IN THE NEW ENCYCLOPAEDIA BRITANNICA

is characterized by the same non-partisan spirit that rendered the Religious articles in the Ninth Edition so justly famous

"Our aim and object has been to look at truth objectively, to face the religions of the world as they are; not as we or others think they ought to be; to present not only what we believe, but what everybody believes. Somewhere is the white light of truth; this light, passing through the prism of many minds, breaks into a thousand varying colours. You may say that the book is parti-colored. You cannot say it is partisan."

W. ALISON PHILLIPS,
Editor of the Religious Section of the 11th Edition.

THE broad liberality of spirit in which the New Encyclopaedia Britannica was planned may be said to find its highest expression in the articles which deal with religion. Here, in a field which he probably conceives to be the most important of all, but to the exploration of even a fraction of which his whole life would be inadequate, the supreme need of the average educated man is for the unbiased guidance of competent investigators whom he can absolutely trust; and, to quote Canon Gore (in a recent review of the work): "*There is no exaggeration in claiming that we have this guidance in abundance in the Encyclopaedia Britannica. It is not the organ of any sect, party or opinion. It is not concerned with the defence or refutation of beliefs, but only with the judicial and unimpassioned statement of the facts on which they purport to rest.*"

The Article on the Bible

THE article **Bible** in the 9th Edition was the work of one scholar, Professor Robertson Smith. It occupied 15 pages and it presented for the first time to laymen the results of the labors of Biblical Archaeologists, Historians and Critics during the preceding generation.

The article **Bible** in the 11th Edition occupies 45 pages and is the joint work of seven authorities, no less a number being demanded by the increased specialization and scope of biblical research since the 9th Edition was published. To quote Canon Gore: "Investigation has pushed its way with uncompromising zeal, brooking no denial, flinching no result. In every direction it is cutting new roads and penetrating jungles where our fathers had no success. It is framing new apparatus and calling new science to its aid. **And the conclusions of our age are stated in these volumes clearly and fairly by men of the highest reputation in their several departments of study.**"

In the section **Bible, Old Testament,** the articles **Chronology, Canon,** are by S. R. Driver, D.D., F.B.A., Regius Professor of Hebrew, Cambridge University; **Text and Versions,** by J. F. Stenning, M.A., University Lecturer in Aramaic, Oxford University; **Textual and Higher Criticism,** by G. B. Gray, D.D., Professor of Hebrew and Old Testament Exegesis, Mansfield College, Oxford.

Contributors on the New Testament

In the **New Testament** section, the article **Introduction and Canon** is by W. Sanday, D.D., F.B.A., Lady Margaret Professor of Divinity, University of Oxford; **Text and Versions** and **Textual Criticism** by Kirsopp Lake, Professor of New Testament Exegesis, University of Leiden; **Higher Criticism** by F. C. Burkitt, M.A., F.B.A., Norrissian Professor of Divinity, Cambridge University; **Chronology** by C. H. Turner, M.A., F.B.A., Late Speaker's Lecturer in Biblical Studies in the University of Oxford.

The Article **Christianity,** by George W. Knox, D.D., Professor of the History of Religion, Union Theological Seminary, New York, deals with some other aspects of the same subject.

The **English Bible** (Various English Translations) is jointly treated in a separate article by Miss Anna C. Paues, Ph.D., Lecturer in Germanic Philology, Newnham College, Cambridge, and H. H. Henson, D.D., Canon of Westminster and former fellow of All Souls, Oxford.

Other Religious Articles

IF the reader will realize that this one article **Bible,** of which the scope and authority have been indicated, is typical of **844** articles on Biblical Criticism, **1,773** articles on History of Christianity, and **855** articles on Comparative Religion, to say nothing of the numerous articles arising out of these (*e.g.*, Sects and Denominations), he will understand how it comes about that the 11th Edition is regarded by scholars as the most comprehensive modern dictionary of the Bible and Religion in existence.

If he will further remember that Religion is only one of the thousands of subjects traversed in the work and that the treatment accorded in every case is no less authoritative, he will be able to appreciate the truth of the simile in which the 11th Edition was described by a critic as constituting a true cross section of the trunk of the tree of knowledge as it stood in the year 1910.

The Eleventh Edition of the Encyclopaedia Britannica comprises 28 quarto volumes each containing 960 to 1,060 pages and an index volume containing 500,000 references.

The 40,000 articles into which its contents are divided aggregate 40,000,000 words, and the authority of the text is confirmed by 7,000 text illustrations, 450 full page plates, and 569 maps.

The reader will do well to note that if he is desirous of obtaining the work at the earliest possible date and on the most favorable terms, he is requested to forward his enquiry on the attached blank without delay. The present "previous to publication" concession will be definitely withdrawn on May 31st, after which date a higher schedule of prices will immediately come into effect.

NEW INDIA PAPER FORMAT

AS further extending its usefulness as an instrument of popular culture, the editors of the 11th Edition consider that the innovation of India paper logically completes on the material side a refining process by which an aggregate of knowledge estimated to be twice as great as that contained in the 9th Edition has been brought within the covers of 28 volumes.

The Nation

NEW YORK, THURSDAY, APRIL 27, 1911.

The Week

Not only the passage of the Canadian reciprocity bill in the House of Representatives on Friday of last week, but also the nature of the vote upon it, was so entirely a foregone conclusion that comment upon the event is hardly necessary. As was the case in the preceding Congress, President Taft's measure received the almost unanimous vote of the Democrats in the House, while a majority of the votes cast by the members of his own party were recorded against it. As an augury of the future, it is not uninteresting to note that two Louisiana Democrats who voted against the reciprocity bill in the last session came over to its support last week. But the most salient fact connected with the story of the bill in the present Congress is the remarkable strength of the Democratic tactics, and the high quality shown by Mr. Underwood, the leader of the party on the floor. The "farmer's free-list" bill was a master-stroke, and Mr. Underwood utilized it in the debate with an effectiveness that left nothing to be desired. What gives real strength to the Democratic position is that the party is grappling with a big and difficult question in a spirit that is at once courageous and practical. If there is to be an era of such leadership as that represented by Mr. Underwood, the term "practical politics" may be rescued from the ignominy into which it has fallen and recover the meaning to which it is legitimately entitled.

It is because Mr. Underwood has both character and brains that his leadership is so welcome. His possession of both had been well established before he was chosen for the chairmanship of the Ways and Means Committee, and his reputation throughout the nation cannot fail to be greatly enhanced by the record of the present session. On Friday, in reply to the assertion made recently by Mr. Cannon that the United States Steel Corporation favored the reciprocity bill, he stated that he was in receipt of a telegram saying that that corporation had stopped work on important mills in his district, throwing 3,000 men out of employment, because of his advocacy of reductions in the steel tariff; and, what is more to the purpose as showing the temper of the man, he pointed out that he had advocated reduction of the steel tariff two years ago —before Canadian reciprocity was heard of—and that the Steel Trust interests had failed to turn him out of Congress in consequence as they had threatened. This means something, in the case of a man who represents the Birmingham district of Alabama; it reminds one of William L. Wilson and the coal tariff in West Virginia. And as for political strategics, Mr. Underwood showed that he knew something about that when, in response to the taunt that the Democrats were "playing politics" with the "farmer's free-list" bill, knowing that it could not become a law, he put his view of the case in a nutshell thus:

> The free list bill will become law, or the Republican Senate that kills it or the Republican President that vetoes it will never be heard from again.

Mr. Roosevelt now tells us that he is "not a candidate for the Presidency," and that if any of his real friends seek to make him such, they will do him "a cruel injustice." The implication, too, is that a cruel injustice was done him last autumn when he was made the issue in the campaign in this State:

> When I got back from Europe, I wanted to go home and be quiet; I didn't want to mix in politics. But I was importuned on every hand—by the insurgents of the West and by the progressives of my own State —to help along the movement for honesty in high places in the political and financial world. It seemed to me that it was my duty to try to help them in the fight for popular government without any regard to what the effect might be to me personally. I didn't see how I could keep out of the fight and retain my self-respect; so I went into it.

But the trouble was that the people on the other side couldn't keep from doing what they did, any more than Mr. Roosevelt could keep from doing what *he* did. If a mere call "to help along the movement" had the effect of compelling Mr. Roosevelt to go out West and make a series of speeches of which the refrain was "I will make the corporations come to time," "I will cinch the crooks," etc., and in which he laid out a vast programme of "new nationalism," who could say how much or how little it would take to compel him to become a candidate for the Presidency? Those who thought that things pointed that way, and didn't like the prospect, certainly had a good deal to go upon; and how could *they* keep out of the fight and retain their self-respect?

Another statesman from Illinois has brought tears to the eyes of hardened Congressmen. This time it is no less a person than "Uncle Joe" Cannon in the course of a three and a half-hour speech against reciprocity. Admiration for that fine old Spartan's remarks on protection and what it has done to people of the country west of the Alleghanies is lost in the deeper emotions stirred by his tribute to the country newspaper:

> When I could not get the truth into the metropolitan newspapers, the country newspapers came to my rescue. God bless the country newspaper! They are a part of us. When we are married and given in marriage they tell the good news. They go to our weddings and our funerals. They rejoice with us when we rejoice, and mourn with us when we mourn.

Once upon a time it was the Republican veterans in Congress who made laws for the country while young Democratic members from the South supplied the poetry and pathos. To-day positions are completely reversed. The young men from the South are busy discussing tariff schedules, and Congress, when thirsting for a bit of human emotion, must turn to the soft sentiment that fairly oozes from veterans like Lorimer and Cannon.

A long vista of trouble between this country and Canada is opened up to the prophetic eye by a little speech made by Representative La Follette, of Washington, in support of an amendment offered by him to take sheep off the free list. The free admission of these live animals, he declared, would to a large extent put wool on the free list. Canadian sheepmen, he said, would drive thousands of sheep over the line before shearing time, and after shearing them would drive them back into Canada, in the meanwhile selling their wool, duty-free, in the United States. Now it strikes us that any one who thinks that this little operation could be easily effected knows not well the subtle ways

that Uncle Sam's tariff guardians keep, and how they can pass and turn again. If they don't want to let wool in free, they may, speaking broadly, be counted on to find ways of confining the free immigration of sheep to the case of sheep who intend to stay and become good Americans. But here comes in the trouble that this affair is part of an international understanding. If the Canadians should fail to take the view adopted by our customs authorities, how will the dispute be settled? Let us hope that the arbitration agreement with Great Britain will be adopted in time to avert all danger of a recourse to arms.

The recall election in Tacoma on Wednesday of last week was the fifth in a little over a month. Two weeks ago Tacoma voted on the question of ousting its Mayor, and gave a plurality of 2,000 against him. But inasmuch as there was a Socialist candidate in the field, the leading candidate failed to obtain the prescribed majority. Hence the election of a few days ago at which A. V. Fawcett was removed from office and W. W. Seymour was installed in his place by a vote of 11,246 to 10,394. On May 2 there will be a recall election involving four city commissioners, who, like Fawcett, have been charged with incompetency and malfeasance. Tacoma newspapers have been printing facsimiles of checks distributed by the Mayor on previous election days to workers at the polls; so there seems to be no doubt that an evil state of things has been remedied. The question naturally arises whether the method is not too cumbersome and too costly. At first sight, it cannot be denied that five elections in five weeks approximates the happy state of things in ancient Athens where people worked a little between politics. But it is only fair to remember that the recall is a new instrument of government which needs complete trying out. Possibly the very frequency with which it is being applied in the beginning, by striking fear into the heart of corruptionists, will obviate the necessity of frequent elections in the future.

The organization of the Progressive Republican Club of Cook County is the initial step toward the capture of Illinois for an anti-Taft delegation at the next national Republican convention. The chairman of the club's committee of eleven is ex-Alderman Merriam, recently defeated for the mayoralty, and the treasurer of the National Progressive Republican League is Charles R. Crane, who was the chairman of the Merriam committee in both the primary and the election campaigns. Professor Merriam, who has apparently turned from one battle to another with the ease of the practised politician, recently met the leaders of the Progressives at Washington, to whom he said that their Illinois sympathizers would be satisfied with either Senator La Follette or Senator Cummins as a Presidential candidate. The trend of opinion at the conference is reported as favoring the Wisconsin leader. Senator Bourne, as usual, felt "hopeful" of their success at the nominating convention; but it is doubtful if even the Wisconsin Senator would in his heart dissent from the opinion of Secretary Nagel that Taft is "as good as renominated."

Mr. Frank M. Ryan, president of the International Association of Bridge and Structural Ironworkers, displays a great deal of indignation over the dynamite affair. But the indignation does not relate at all to the dynamiting; it is reserved exclusively for the operations of the detectives who are trying to hunt down the guilty persons. Mr. Ryan may or may not be right in his assertions as to the alleged violation of the Constitutional rights of John J. McNamara; but the heated language he uses in regard to this is in striking contrast with the cold and formal statement he makes concerning the outrages charged against the arrested men. With a long series of murderous dynamite outrages in the industry with which it is concerned, what evidence has the Ironworkers' Association given that it desires to help run down the men guilty of them? Its formal declaration of innocence may be accepted at its face value, but so long as it neither says nor does anything to show a real abhorrence of the crimes, it cannot complain if a large part of the public places upon it the odium of sympathizing at heart with the criminals.

The consecration ceremonials last week at the Cathedral of St. John the Divine on Morningside Heights were symbolic of larger things than the power and prosperity of the Protestant Episcopal Church in the United States. It has been the favorite contention of our modern pietistic æsthetes that we cannot build great cathedrals nowadays because we have not the faith that animated the builders of Amiens, Rheims, Milan, Cologne, and Seville. Henceforth this contention will have to take account of the fact that the fourth largest church in Christendom is being erected by the inhabitants of the most money-making city in the most money-making country of a Mammon-worshipping age. The phenomenon cannot be brushed away as a mere expenditure of ostentatious millions by a denomination that has them in plenty; after all, people give money only for what they greatly desire; and who shall set out to balance the motives of a New York railway president of to-day against the motives of the Cologne merchant-prince of the fifteenth century? In any case, if we are to judge of the strength of religious faith by externals, which we do in speaking of the mediæval churches, here would seem to be evidence that the church is not tottering on the brink of destruction, as we are so often assured.

The sale of the Gutenberg Bible on Monday evening for the record-breaking sum of $50,000 is likely to be the best remembered, if not the most memorable, event of the tercentenary year of the Authorized English translation. How fitting the episode seems when we reflect that the prime purpose of that translation, as well as of Gutenberg's invention, was to put books into the hands of the people. It would have been interesting to be able to watch the faces of Wiclif, Gutenberg, and Caxton as they saw this particular copy of a Latin version of the Bible gradually coming within reach of the highest bidder. Their energy in the work of translating and printing could not but have received a great impetus. At the same time, there is for us the comforting assurance that future generations will form their judgment of us partly from the circumstance that the most highly prized volume of our day was the Bible. How fortunate this is, and that we are not to go down the ages as frenzied bidders for, say, The Game and Playe of the Chesse!

It was the fighting at Agua Prieta that undoubtedly brought about the

present negotiations for peace in Mexico. The victory won by his troops put President Diaz in a position where he might offer concessions without actually appearing to have been frightened into yielding. The insurgents, on the other hand, in spite of much brave talk about storming Juarez by the clock, were compelled to take into account the excellent fighting qualities of the Federal troops as displayed at Agua Prieta. More important than all, the killing of Americans at Douglas brought the possibility of American intervention a little more abruptly to the front than either Federals or insurgents liked to have it. For, in spite of vast rumor about both sides in Mexico yearning for intervention, both sides must be fully aware what a terribly edged tool that would be to play with. Thus came the present armistice, with every prospect of a definite settlement upon terms largely favorable to the insurgent cause. There is little question that Diaz is at present chiefly concerned with saving his "face." The aged dictator has already yielded enough when he consents to the maintenance of the insurgent forces under arms until his promises have been put into practice.

British foreign trade has been so much in the habit of breaking records of late that a fresh instance of it hardly calls for notice. Still, as it happens that exports from the United Kingdom for the month of March exceeded those for any single month on record, and exceeded the March figures of recent years by an astonishing amount, it may be worth while to call attention once more to the matter. The exports of British produce last month reached the enormous total of £40,863,000, or, say, $200,000,000, an increase of $30,000,000 above the figures of March, 1910, and of $45,000,000 above March, 1909. In the single item of yarns and textiles the exports for March were $80,000,000, an increase of $18,000,000 above last year. The exports of British produce for the whole year 1910 reached the record-breaking total of £430,384,000, or $2,150,000,000; and each month thus far in 1911 has shown an increase over 1910. The imports, too, tell a similar story. Along with this steady rise in the foreign trade figures there has been a general diminution of the figures of pauperism and unemployment. With the tide thus running against them in the way of home figures, it is no wonder that the protectionists seized with such avidity upon the story of American workingmen's wages told in the recent Board of Trade report. They had been proclaiming for years that British trade was going to the dogs on account of free trade, and it has been obstinately refusing to go; if they could substitute American prosperity for British ruin as a rallying cry, there would still be a chance for them. But we hardly think that this cry will carry far or hold out long.

French intervention in Morocco is probably not so imminent as some reports from Paris would make it. And this, in spite of the fact that Morocco really does present to-day the condition of anarchy which is the classic excuse for European intervention in the affairs of the lower breeds. Mulai Hafid, who ousted his brother from the throne by posing as the champion of Moroccan orthodoxy against such blasphemous innovations as the railway and the phonograph, is now beset in turn by the unruly tribesmen. France has no reason to be grateful to Mulai Hafid, and if she were, she would only run the risk of having some new Pretender take the field against a Sultan who allied himself with the heathen dogs. From the selfish point of view, it is for the best interests of France to let the Moroccans stew in their own juice for a little while longer. And all the more because public opinion in Spain, which France must take into account, is reported as distinctly hostile to intervention. The Spanish people have presumably had enough of African adventure to last them for some time to come. Prime Minister Canalejas is not likely to overlook the fact that it was an unsuccessful African campaign that undid the Conservatives and brought him into power.

One of the most remarkable aeroplane flights, or rather voyages, yet recorded, was that undertaken by two German officers, Lieuts. Mackenthun and Erler, in an Albatross bi-plane at the end of March. By the arrangement of their machine one of the aeronauts sits behind and a little above the other, so that either can steer and control the bi-plane. Leaving Berlin on March 29th in the afternoon, they flew to Hamburg at the rate of about fifty miles an hour, landing without the slightest trouble. The next day's flight was from Hamburg to Bremen, seventy-four miles in one hour and fifteen minutes, the flyers readily overhauling and passing one of the fastest express trains in Germany. The third day's trip was to have been to Hanover, but high winds necessitated a landing at Verden, thirty-two miles being covered in one hour and five minutes. On the fourth day, Hanover was reached, and on the fifth, Brunswick, the return to Berlin being on the sixth day, severe winds on the last two days necessitating frequent landings. The aeronauts were most enthusiastic, particularly over their first day's flight. Owing to their being able to relieve one another, they were not in the least exhausted by this long trip at such high speeds, and at no time did they have the slightest difficulty with their engine.

M. Stolypin's recent victory over his opponents in the Imperial Court gives timeliness to Mr. George Kennan's discussion of what is undoubtedly the most important measure in the Russian Premier's programme—the breaking up of communal land-ownership among the peasantry. In the *Outlook*, Mr. Kennan quotes the latest official figures as showing that of approximately ten million peasant families, occupying 270,000,000 acres of land, 1,372,734 families, occupying 27,000,000 acres, have changed from the communal system to private ownership. Thus, in a little more than four years, the communes have lost 13.7 per cent. of their members and 10 per cent. of their lands. We fail to see the reason for Mr. Kennan's statement that so far "it has become apparent that the communal peasants generally are in no great haste to give up institutions and methods with which they have long been familiar." To change the entire system of land tenure of a vast empire to the extent of ten per cent. in four years is by no means a poor showing. On the principle that all beginnings are hard this would mean that within thirty years the entire Russian land system will have been completely transformed. Concerning the desirability of such a change, there are certainly two opinions possible. Mr. Kennan points out that such evils as the creation of a landless class and the increase of poverty have not been slow in asserting themselves.

THE INCOME-TAX AMENDMENT.

Last week's vote of the New York Senate, in ratifying, by 35 to 16, the proposed income-tax amendment of the Constitution, undoubtedly presages similar action in the Assembly. This State had, with apparent reason, been reckoned confidently against the amendment; and the effect of this transfer to the column of States in its favor will be more than merely numerical. The adhesion of New York, the most populous and wealthy of all the States, will naturally give a marked impetus to the movement to ratify. That has already declared itself powerfully in Massachusetts, while in Maine and Arkansas it has led to a reversal of the former vote of the Legislature against the amendment. It is highly probable, therefore, that the necessary three-fourths of the States will finally be procured, and that the Constitution will be so amended as to empower Congress to levy a Federal income tax without apportionment among the States.

This virtually accomplished fact, as we must now regard it, will be the cause of misgivings and even alarm to many. We think, however, that they may be somewhat reassured if they will look with calm at exactly what has been done and at the whole situation as it will stand after the amendment has been adopted. They should note that the amendment is not a tax; it merely confers the power to lay an income tax. This power the government of the United States was supposed to possess, until the Supreme Court decided to the contrary several years ago. Irrespective of the desirability of such a tax, it has been strongly felt by many that Congress ought to be clothed with the authority to levy it. In some national emergency, resort to it might be almost necessary to financial salvation. Nearly every other government in the world has the power to impose income taxes, and many thoughtful Americans have believed that their own ought not to be shorn of it. President Taft expressed that view in his message to Congress, and it has unquestionably had much weight in turning the scales in favor of the amendment. One may be for the amendment without being for the tax.

But the tax will surely follow, it is said. With such a source of revenue put at its mercy, Congress will be more extravagant than ever, and will look to the income tax to make good all deficits. Objectors in this frame of mind will not admit the possibility that Congress may take advantage of the income tax to remit much more burdensome taxes. But in any case, we have to take one thing at a time. If we are threatened with waste and spoliation hereafter, we must fight them as they come up. It is no doubt true that the majority of the people who have been urging the income-tax amendment hope that the power which it grants will be exercised, and that we shall before long have a Federal income tax. If that is so, the next question seriously to be considered is how that tax will be laid, and what safeguards we have against its taking on an unjustly discriminating form.

Take first the possibility that it may be made to bear upon municipal and State securities. This is the great point made by Gov. Hughes. He was for the amendment provided that the loose words "from whatever source derived" were stricken from it. He argued, and we think he argued convincingly, that Congress might proceed under the grant of power made by those words to depart from the old rule that the Federal government ought not to tax the obligations of a sovereign State, and so tax State and city securities as to interfere with the borrowing power. That this might be done, however, does not prove that it will be done. The State and the cities have their representatives in Congress. They cannot be expected, if it comes to a question of framing an income tax, to consent to a measure which would plainly impair the value of municipal obligations or instruments of the States. The feeling of their constituents would be so explicit and pronounced on that point that they could not well fail to give heed to it. While it is true that the words "from whatever source derived" would enable Congress to pass an absolutely inclusive income tax, the strong probability seems to us to be that it would, in fact, exempt the securities of States and municipalities.

There remains the possibility of a discriminatory and despoiling income tax. The small and poor States, it is said, will combine so as to devise an income tax which will strike only or mainly the inhabitants of the large and rich States. But those who argue in this way are thinking chiefly of the Senate, in which Nevada or Idaho has as much power as New York. It will not do, however, to forget the House, where the basis of representation is population, and where the populous and wealthy States ought to be able by mere numbers to prevent the adoption of an income tax cunningly designed to throw almost the whole burden upon them. Consider some of the groupings which might be made by the Representatives from the larger States—even under the present apportionment; under the new one, their proportionate power will be much increased. New York with 37 members of the House, Pennsylvania with 32, and then Illinois, 25, Ohio, 21, all of New England, 29, New Jersey, 10, would be alone well up toward a majority of the House, and ought easily to be able to exert a political power that would be sufficient to prevent the enactment of any income tax that was leveled like a weapon at their particular section of the country. If they are not, the fault will not lie in the Constitution or in the income-tax amendment, but in the want of ability or fidelity on the part of the Representatives. We can only meet each issue as it arises and see to it that all that reason and justice can do shall be done in order to induce the democracy to decide it aright.

GETTING ALONG WITH THE CONSTITUTION.

There are extremely important questions connected with our present-day conditions which, if they had been in existence when the Constitution was framed, or had been clearly foreseen by its framers, would have been provided for quite differently. And it is not to be wondered at that many ardent souls are sorely perturbed over these things, and are ready to seize upon any method of getting rid of the obstacles that the Constitution places in the way of their schemes of reform or innovation.

That this impatience should have been manifested with the greatest frankness by the sole representative of the Socialist party in Congress is natural enough. Mr. Berger does not beat about the bush, but flatly declares the Constitution to be antiquated and obsolete, a Constitution made for a people of hunters and farmers and utterly unsuited to our present estate. He wishes it brought up to date by the straightfor-

ward process of calling a new Constitutional Convention. Mr. Roosevelt's idea of the need of recasting the Constitution is not much less radical at bottom than is Mr. Berger's; but his way of accomplishing as much change as may from time to time seem necessary may be described—not accurately, indeed, and yet not altogether incorrectly—as that of ignoring such parts of it as have manifestly ceased to be suitable to existing conditions. And there are others who feel that the Constitution is an intolerable drag.

The chances are, however, that we are going to jog along with the Constitution, pretty nearly as it now is, for a long time to come; and not altogether through our inertia or stupidity either. The demonstrations of the thesis that the Constitution is a failure suffer from the same defect as those that attempt the like task in regard to the institution of marriage. It is easy enough to show that either of these institutions does not always work as we should like to have it, and that it often stands in the way of this or that desirable consummation. But when you have got so far as this, you are only at the threshold of the question; it is when you think of what you would put in its place that you find how little headway you have made in your agitation. Take, for instance, the single question of States' rights, the crux of the Constitutional issue. The anomalies of our existing system, with forty-six kinds of marriage and divorce laws or child-labor laws, with every State threshing out a score of problems in its own little Legislature according to its own taste and fancy, paying perhaps little or no regard to the experience of the others—these anomalies are evident. But what is the alternative proposed? Can we complacently think of all the people of this country, from Maine to Texas and from New York to California, looking to Washington as the source of all governmental wisdom and the arbiter of their affairs? Can we, indeed, imagine the laws enacted at the capital, and bearing upon a hundred phases of daily life, being enforced in every corner of our great American domain, without reference to local sentiment? And yet, unless something like that is in contemplation, it is difficult to find any justification for the idea of putting the Constitution into the melting pot and making a fresh start in our national history.

Take, for illustration, the question of child labor. A few years ago, a wave of agitation in favor of Federal regulation of this subject seemed to be sweeping over the country. The Beveridge child-labor bill embodied the ideas of the champions of this movement. It is possible that that bill, if enacted, would not have been pronounced by the courts a violation of the Constitution; but it certainly was in violation of the spirit of the Constitution. By some it was opposed on this ground; by others—and among them some of the most sincere as well as the wisest of the advocates of prohibition of child labor—it was opposed on the ground that the only sound and solid way of attaining the object was through the education of public opinion in the various States. You might get your law on paper without this, but it would be nullified. Well, the bill was not passed; but there has been a surprisingly rapid growth of sentiment in favor of proper laws in the very region that was considered least promising. Professor Lindsay, writing on the Seventh Annual Child Labor Conference, held at Birmingham, Ala., last month, tells of the remarkable change that has taken place in Southern sentiment on this subject in the short space of two years. Whereas at the Atlanta Conference, in 1909, Southern interest in it was almost wholly lacking, it was manifested this year in such a way as to make the Birmingham conference "the most stimulating and encouraging meeting the National Committee has ever held." Something has already been achieved in the South in the way of legislation, and more is under way; but the important thing is the change in the attitude of representative business men. Who can doubt that this way of dealing with such problems is better suited to the American genius, and brings about better results in the end, than the short-cut that centralized power might furnish?

An absolutely rigid Constitution would of course be intolerable. Some degree of elasticity ours has always had, if for no other reason than its brevity—its wise abstention from detailed prescriptions. Over and above that elasticity—manifested in the inevitable, though gradual, changes of judicial opinion—it is essential that we should look upon the adoption of specific amendments as a recourse really within our reach; and this is on the eve of being effectively accomplished with the adoption of amendments for direct election of Senators and for a Federal income tax. On the other hand, the calling of a Constitutional Convention, though provided for in the Constitution, would be a leap in the dark. And the more the possibilities of such a step are considered, the less it will appeal, we are sure, to those who try to picture to themselves what substitute it would be possible to devise for the present structure taken as a whole.

THE CANADIAN SIDE OF IT.

Attention in this country has inevitably been fixed mainly upon the interests of the United States involved in the reciprocity agreement with Canada. American newspapers and Congressmen are not ready to be called worse than infidels for neglecting to provide for their own household; and the chief debate, as well in the press as in Congress, has been about how much we shall gain and how much lose if we stand to the Canadian bargain. References to the part of Canada have been mostly confined to questions of detail: whether she is not getting the best of the trade; whether her concession of free cotton-seed oil is not more than offset by our admission of her fish free of duty, and so on. The broader aspects of the matter, from the Canadian point of view, have been little dealt with here. It remained for a French writer, M. Jacques Bardoux, to set forth the larger significance of the reciprocity proposal, as it bears upon the whole spirit of nationalism in Canada, and this he does in an instructive article in the last number of the *Revue des Deux Mondes*.

M. Bardoux traces with a sure pen the development of the national spirit in the Dominion. An essential part of it is the demand for an entirely free hand in making fiscal arrangements. Canada enacts her own tariffs. Latterly she has begun to insist upon making her own treaties, in so far as they affect trade. She declines longer to be bound, in matters of commerce, by the most-favored-nation treaties that Great Britain may negotiate with other countries. The very excesses of protection and bounty-giving into which Canadian legislation has run are a proof that our

Lady of Snows means to be mistress in her own house. M. Bardoux shows, however, that this heightening desire for an independent and self-contained national life was somewhat checked, and at one time threatened to become diverted, by two powerful influences emanating from England. One was Imperial Preference, the other was Imperial Defence. Chamberlain's plan for a system of favored trade within the Empire temporarily attracted and almost entangled Canadian statesmen; and later, his grandiose schemes for a union of all the land and naval forces of the colonies under an Imperial organization and command had a disturbing effect in Canada In the latter particular, the dispatch of a Canadian contingent to the Boer war led to high-soaring hopes, which have since fallen to the ground. Yet Sir Wilfrid Laurier for a long time seemed disposed to meet Chamberlain's views, at least in the sense of his own words uttered at Edinburgh in 1897: "We are free, surely, but we are only colonials, and we aspire to be something more than that. We seek to play a greater rôle in the British Empire. Far from falling back, we ask only to go forward and to bear our full share in a united Empire."

What has happened since that date to make Sir Wilfrid Laurier "fall back," as he undoubtedly has done? He has turned the cold shoulder to Imperial Preference. He has declined to permit an English soldier to take command of the Canadian army. What were the influences and the motives that induced the supple politician at the head of the Canadian Government to recoil from his Imperial tempters? M. Bardoux makes the matter clear. He shows how the growth of a distinctive National party, under the leadership of Henri Bourassa, became a fire behind Sir Wilfrid Laurier in Ontario and Quebec, while the rapid expansion of the provinces in the West, with their rising hostility to protective tariffs and their demand for free trade relations with the United States, opened his eyes to a great political danger. The Nationalists made their campaign, and showed great strength, against large military expenses on Imperial account; and in his trip to Winnipeg last autumn, Sir Wilfrid got a near view of the demands of the embattled farmers. Many of them had crossed over from the United States; and though they were quite ready to swear allegiance in their new home to the British crown, Uncle Sam still meant more to them than John Bull; and the cheaper shipment of their products by the route to the South, if only trade were made free, appealed to them strongly. This Western tour of the Canadian Premier may reasonably be thought of as the turning-point in his attitude on tariff matters. At any rate, thereafter his commissioners were much more ready to deal with the Americans than before, and the reciprocity agreement is the result.

From the way in which this is regarded in Canada and in England, one can see that it is to be thought of as meaning far more than a measure to promote trade. It is a final assertion of Canadian nationality, a definite swinging away from domination by British policies. This accounts for the cries of grief which the proposal of reciprocity between Canada and the United States has drawn from high British Imperialists. They see in it a mortal blow to their darling projects. If Canada has thus so resolutely set up for herself, the effect upon the other colonies is feared, so that it is well nigh certain that the Imperial Conference next month will do little for Imperial Preference except decently to bury its remains. Canada has, in effect, by this final step of the reciprocity pact, served notice upon the mother country that she is now a full-fledged nation.

MAGNIFYING THE GOVERNOR'S OFFICE.

It is more than four years ago that Secretary Root, as he then was, made his speech summoning the States to a fuller exercise of their legislative powers. Behind it there lay, or was supposed to lie, a threat that the Federal Government would find a way, either through or around the Constitution, to take up the neglected duties of the States. Whether that was intended or not, we felt and said at the time that the challenge which Mr. Root addressed to the States ought to be accepted; that their right to control the corporations which they had created ought to be vigorously asserted; and that their Governors should take the lead in seeing to it that the local governments of whose historic value we had been rather idly boasting should be made really effective. Now, though there may be no relation of cause and effect, it is at least an interesting coincidence that, since Mr. Root spoke, there has been a remarkable quickening of the activities of the States. They have enacted a large body of regulative laws. Above all, many of their Governors have stepped forward into a leadership quite new. Not since the day of the "great war Governors," as they were called, have we had anything like the present number of State Executives who have made a fine reputation for strong administration and successful championing of advanced and reformatory legislation.

Gov. Wilson's name just now leads all the rest in public estimation. It is an unexampled triumph which his legislative programme for New Jersey has scored. Nearly every pledge made during the campaign has been carried out; and New Jersey, from being one of the backward States in laws relating to the control of public-utility corporations, to election and ballot laws, to corrupt practices, to employers' liability, and the like, now ranks with the most forward-looking. All this has been achieved within a legislative session of three months, with very little pyrotechnics, no fierce struggles, and amid general approval. The Governor met with machine opposition, in his own party and in the Republican, but his energy and persistence, joined to the immense prestige he won in his campaign and by the defeat of Boss Smith for the Senatorship, swept every obstacle away. We think it the literal truth to say that no man in public life ever mated performance to promise better than Gov. Wilson.

Other Democratic Governors follow Woodrow Wilson, not by too great an interval. In Massachusetts, Gov. Foss is at once delighting his friends and confounding his enemies. Even partisan Republicans are forced to concede that his great industry and complete devotion to the work of his office, together with his good appointments, his well-judged vetoes, and his sound recommendations, have made a great impression upon the State and largely obliterated the bad effect of the Governor's course in the Senatorship contest. In Ohio, Gov. Harmon has thus far not been able to obtain from the Legislature the leading reform measures which he has energetically urged in special messages.

Some of them will doubtless be enacted before the session closes; and in any case the Governor has heightened the reputation which he won during his first term as an able, hard-working, honest, and independent Executive. Conditions in Ohio are peculiar; the old Democratic machine is against Harmon, openly or secretly, and his Presidential candidacy doubtless handicaps him somewhat; but he has at least silenced the Republican sneers about Democratic incapacity. One hears little that is not good about his neighbor over the Indiana line, Gov. Marshall. He, too, must be reckoned with among the Democratic Executives who are showing that we have in this country more than one party "fit to rule."

It is only fair, of course, to say that in this general movement to magnify the office of Governor, several Republican Executives have been prominent. Gov. Hughes's work in New York brought him national renown. In New Hampshire, it is a Republican Governor who has just succeeded in dragging from a reluctant Senate compliance with nearly the whole of his reform programme. In California, too, as also in Michigan and Wisconsin, the newly-elected Governors are making a good record. The credit for this distinct looking up of the States is to be monopolized by neither party. There appears to be, in this matter, a common vivifying impulse. Yet there can be no doubt that the most conspicuous Governors are just now Democratic, and this, conjoined with the fact that their party in Congress is bearing itself with unexpected wisdom, promises to become a great political asset in the Presidential election next year.

The name of one Democratic Governor does not appear in the list of successful Executives. That is because no one yet knows whether Gov. Dix ought to be placed there. No Governor had greater opportunities; by none has so little been achieved. His final ranking, however, remains to be determined. People are ready to make allowances for the terrible difficulties which Murphy and Sheehan thrust upon him from the first. All legislation was strangled for two months. But while the light yet holds out to burn, it is not too late for Mr. Dix to return. In the brief remainder of the session, it is humanly impossible that he can accomplish all that he has set before himself, but some things he can do. He can insist upon an honest direct-primary bill, in pursuance of the party pledges. He can kill "ripper" bills with his veto, and repel assaults upon the civil-service laws. If not the dash and brilliance of Gov. Wilson, he can at least display something of the steadiness and high-mindedness of Harmon; and so save the Governorship of New York from being the one great exception to the revival and ennobling of the powers of State Executives.

THE "SUPERFLUOUS" IN EDUCATION.

It is a sign of the times that a man of such influence as Professor Hibben of Princeton has come out strongly against specialization by undergraduates. In an essay which forms one of a collection he fortifies his opinion, not by an array of statistics nor by pertinent illustrations from the leading institutions, but by calm and philosophical reasoning. The points of his argument are not new, but the precision with which they are made, together with the broad culture which lies behind them, will of itself show the need of our producing minds of this broadly educated type. He takes for a text Voltaire's paradox—*Le superflu, chose très nécessaire*—and argues that specialization defeats its own purpose; that for a student to narrow his attention to only such subjects as bear directly on his chosen profession makes of him a poor doctor or lawyer or what not, because it makes of him an inefficient man:

> It is in the reserve power which we insensibly discern back of a man's personality that our confidence in the lawyer, the doctor, the minister, or the engineer is grounded. The difference between the ordinary and the extraordinary man in professional or business life, lies in just this surplus of power which in the daily routine of life is never required.

There is an important side of this question on which Professor Hibben did not see fit to touch, though it is implicit in much that he says. It is the danger that, if present systems prevail, the college and university will cease to be the home of ideals. Some would undoubtedly say that they have already ceased to be that. There is, at any rate, a perilously close connection in this country between these higher institutions and life without. The public in large part demands it, especially in the case of the State universities. In the popular mind, education means something "practical"; it must lead to visible and immediate results even in fields seemingly speculative. A course in literature, like the five-foot shelf, must elevate in a way that can be measured. Having, as they think, grasped its significance, the people have bidden education come down from the mountain heights of spiritual aims and graces. They have penetrated the secret of the university—its real use along with its left-over nonsense—and have forced it to give an account of itself. A nation of experts, they challenge the right of even the university to teach in ways whose use does not satisfy their practical intelligence.

On their side, the universities—or many of them—have yielded. They have devised schemes of study which respond almost automatically to the social and industrial conditions of the outer world. Scarcely an occupation springs into being before courses are given in preparation for it. Like a great intellectual department store, the universities in question are ready to meet the most varied, the most minute public demands. Given workers, they will turn them out steeped in common sense, not vainly trying to set life to rights by vaporous theories. Filled with this ideal (if such it may be called), these universities fashion their students so carefully for after-life that to enter it causes no shock whatever. The difference intellectually between the college man and others is growing to be not one of quality at all. By the very nature of the educational plan, his mind is trained in a literal, matter-of-fact way; it catches up a wider range of facts than the outsider's, yet only rarely does it acquire that sturdy logic and imaginative reach which should be its distinction. Herein lies the desperate irony of those advocates of strictly up-to-date systems who, determined that the college shall serve the country, have held up American life before the students' eyes at too close range, and have given them little of that detachment which makes for perspective and true judgment.

Something of this danger has, of course, been admitted by prominent educators, President Lowell in the forefront. But the mischief has been done and can be undone only by heroic treatment. For even at our oldest universities, the atmosphere of idealism is too

seldom breathed. With the constant introduction of little, highly specialized courses, it is possible for instructors with no great talents or breadth to be apparently efficient; and the attraction which used to be felt for a community of scholars is tending to die out. One looks now with unsatisfied yearning for teachers of firm idealism—a Shaler, a Norton, a Dana—to give a proper outlet to young men's visions. The reality of the condition is evident, and he is blind who has not seen the tragedy of thoughtful youths, come from a distance to be cheated of the inspiration for which they sought.

It can only follow from a decline of idealism that the university is ceasing also to be the home of ideas—or at least of ideas that truly count in young men's lives. Nowadays boys are seldom beset by an unyielding impulse to work out high dreams in actual living, to bridge by the very force of their wills the gulf which the work-a-day world accepts between theory and practice. The point may be illustrated by the reply of an Englishman at one of our large universities to a student who had submitted to him a bit of original verse. It was: "This is pretty, but you wouldn't fight for it."

OUR DISCORDANT CRITICS.

It is just ten years since W. T. Stead startled his countrymen by his cry of "The Americanization of the World." He approved that Americanization, and asserted its comprehensiveness. It was not trade alone in which we were rapidly winning supremacy. "Not even the most cursory observer can overlook the direct influence which American religious life and thought have had." "The direct influence of American books on the non-American world" was increasing. Already, in humor, "the Americans have left their English kinsmen far behind," while "the American newspaper is distinctly ahead of its English contemporaries." "America now leads the van of astronomical science," and "will have one day the most magnificent school of painting in the world." The American girl "is always bright, vivacious, and intelligent, often beautiful"; the American millionaire gives away his money on an unparalleled scale; even in sport we excel the British; our superiority in education is evident; and "the average level of intelligence in the United States, despite the immense influx of nineteen millions of the uneducated European horde, is much higher" than in England.

But what a change a decade has wrought! The title of the newest book about us is suggestive of a very different picture, for Monroe Royce, returning to his native land after twelve years' absence, can describe what he finds only in the phrase, "The Passing of the American." Not to be outdone by a foreigner, Mr. Royce, too, is comprehensive, but not complacent. The American, in his view, "is found wanting, and is giving place to the dull-witted, heavy-handed foreigner." We are inefficient, and therefore stand at the tail of the list of nations that win the Nobel prizes. Our critic knows of "but one street fruit and peanut vender in New York who is an American." Our immigrants "can outwork us, can also beat us on the land, and in the laboratory and market." They must accordingly be "held at bay" until we can train our children to compete with them. Only in rudeness do we outdo them, and they soon learn that. The American pulpit has been in a decline for years, and now the American platform is following it. American women are unwilling to marry, unless they can "better their position." "The American schoolboy is vastly inferior to his European contemporary in scholarship," Congress is without a single man who is fit for high political leadership, and "the native wit and good sense of the American are fast passing away."

Now, if we were the politest people in the world, how could we manage to admit the truth of both of these sets of criticism and retain any self-respect? We do our best. We were not unduly exalted over Mr. Stead's canonization of us, and we are not unduly depressed by Mr. Royce's condemnation. In our stupid, blundering, but well-meaning way, we grant all we can and get a little good-humored fun out of the rest. Doubtless this is wrong. If we were deserving of all the attention we receive, we should know how to reconcile our domination of the world with our submergence in our own country. But Mr. Royce expects even more than this. He presents us with a major premise of hordes of immigrants, whose degradation in this country is "sure and rapid," and to whom idealism is impossible. His minor premise is the American, "the quickest-witted, most fearless, most inventive, and most adventurous person the world has ever known," but unfortunately, not a plodder, and with an inherent dislike for continuous hard work. And this is his conclusion: the American "is found wanting, and is giving place to the dull-witted, heavy-handed foreigner, who is willing to work and who knows how to work. . . . Not one-tenth of the untrained country-people who desert the land for the town can make their way in the face of the skilled and efficient foreigners who compete with them at every turn." The mystery of "how the greater majority of the native American people find the bare means of living" is but partly dissipated by the discovery that there is one field of labor in which they still hold undisputed sway, namely, the railway car. This phenomenon also is unexplained. We are so completely stumped by such reasoning that we are constrained to add to our loss of humor an admission of our want of logic.

It is not only alien and expatriated critics that puzzle us. There are those of our own country who pour their shot and shell at all parts of our social, political, and economic structure, often with deadly rhetorical effect. They delight in showing their ability to do what Burke confessed to be beyond his comprehension, for to them the indictment of a whole people and all its activities is easy. But it is precisely this unrelieved black that disturbs us. At first we put on the proffered sackcloth and ashes readily enough, despite the rather too business-like air of our official mourners. In time, however, we grow tired of it. We cannot bring ourselves to submit to adopting it as a national costume. And we are bewildered by the number and variety of our mortal diseases and capital crimes.

What we need, and what we dare say we should have the good sense to welcome, is diagnosis that discriminates between passing ills and chronic maladies, between a disorder and an indisposition. We have not sought out physicians, and therefore we may be allowed to request so much. Nor do we ask for a cure. Reasonably accurate definition of what is the matter with us will be sufficient to win our gratitude. Mr. Royce himself, in his chapter on "The Passing of American Humor," has a most apt il-

lustration of what we require. It is Lincoln's story in reply to a delegation of lugubrious patriots who pointed out to him how everything was going to the dogs, with its climax of the frightened farmer's prayer in the thunderstorm, "O Lord, if it is just the same to you, give me more light and less noise."

THE AMERICAN ORIENTAL SOCIETY.

BOSTON, April 21.

The 123d meeting of the American Oriental Society, which was held at Harvard University on April 19 and 20, was fairly well attended. Forty-six papers were announced, but as the writers of a number of them were not present, almost one-half were read merely by title. The smaller number of papers actually read had, however, the advantage of allowing more time for discussion.

The presiding officer this year was Prof. Maurice Bloomfield of the Johns Hopkins University, who gave an admirable presidential address on "The Religion of the Sikhs"—the Hindu-Mohammedan sect which, founded in Northern India at the end of the fifteenth century A. D., has played so significant a part in the political and religious fortunes of India. Professor Bloomfield showed that in its tenets and general attitude toward life, the Sikh religion displays little if any originality. Its founder, Nanak (born in 1469 A. D.), was thoroughly saturated with characteristically Hindu thought, despite the fact that at that time one-third of the population of Northern India, through its abhorrence of idol-worship, had been attracted to Islamism. Even the lower classes of India had turned Moslem, because through Islam they could free themselves from the oppression and degradation of the caste system. Though a strong dash of monotheism had been introduced into the pantheistic ideal of higher Hinduism, the conception of the Divine as formulated by Nanak and his successors remained essentially pantheistic—not differing in any marked degree from the general level reached in the Upanishads many centuries previous. Transmigration, which runs like a thread through the entire religious history of India, is also an essential element in Sikh doctrines, and the lack of originality of the sect is further illustrated by the stress that it lays in common with other Hindu sects upon fusion with the "One True Being," of which every living thing is a part, as the only means of salvation from the round of existences. The favorite designation in Sikhism for this one Being was simply "Name," which is employed almost cabalistically and defined by Nanak himself as "the god of all gods." Karma, or "deed," as controlling men's destiny—so prominent in the purer Hindu philosophies and in Buddhism—is also a feature of Sikhism, though generally construed as sinister—as "evil deed." It must also be recognized that the ethics of Sikhism, without being specially original, are founded on high ideals. Philanthropy, justice, truth, and domestic virtue are forcibly set forth as standards to be followed.

The primal factor, however, to account for the rapid spread of the teachings of Nanak and his successors and their development into a religious system, was the emphasis laid upon the supreme authority of the "Teacher" in his relationship to his pupils. The relation of teacher and pupil had always been pious, sentimental, and sacramental in India, but in Sikhism it became the foundation-stone on which the entire structure was reared. The name Sikh means "disciple," while the term Guru, by which Nanak and his nine successors are known, signifies "teacher." Through the Guru alone the way to salvation can be attained. Obedience to him is absolute, and he takes precedence, therefore, even over one's parents. This errant child of Hinduism is returning to the bosom of its aged, but not altogether decrepit, mother. The Sikhs now again worship Hindu gods in Hindu temples.

After the presidential address, the reading of papers began and continued throughout the four sessions that were held. It is possible in a summary account to refer to only a limited number out of the many that merit mention. Prof. Paul Haupt of the Johns Hopkins University, whose indefatigable industry always insures a rich harvest at these meetings, presented four papers. One of special interest was his discussion of a number of passages in the famous Babylonian account of the Deluge, forming part of the Babylonian Epic that so long ago as thirty years Professor Haupt had made one of his special studies. He showed by an improved translation of certain lines that the Deluge, localized in the Babylonian account in the old city of Shurippak, was originally planned by the local deities of that place, who induced the "great gods" to give their adherence to the plan. The value of the new interpretation lies in the further proof furnished for the growth of the story from a merely local catastrophe to a general destruction of mankind—which is the form in which we find the tale in the strikingly parallel Biblical account. Professor Haupt also furnished a satisfactory interpretation for the rather mysterious manner in which the god Ea (the god of the waters) announces the coming destruction. He showed that the two words used, *kikkishu* and *igaru*, signifying "reed-hut" and "brick-construction," referred respectively to the simpler and more elaborate dwellings of the Babylonians, and were thus intended to point to a general destruction, involving small and large, simple and grand. Professor Lanman reported progress on an elaborate edition of Buddhagosa's "Way of Purity," on which he has been engaged for several years. He was urged to undertake this almost thirty years ago, but it was only recently that he could attack it in earnest. Buddhagosa was a learned and remarkable religious leader in the southern division of Buddhism, who was born just fifteen hundred years ago. Besides commentaries to various portions of the Pâli canon—the sacred scriptures of the southern Buddhistic "church"—he wrote an elaborate exposition of the teachings, principles, and philosophy of Buddhism, the importance of which for a knowledge and study of Buddhism has only recently come to be recoguized by students of the religious history of India.

Another work of a large character of which announcement was made at this meeting was Professor Bloomfield's investigation of repetitions in the Rig-Veda, following as an aftermath to this scholar's concordance of the Rig-Veda, published in the Harvard Oriental Series. It appears that of the 40,000 verses of this ancient collection, 2,000 are repeated, and since in many cases the same verse occurs hundreds of times, just about one-fourth of the Rig-Veda is repetition. The value of these repetitions, with changes in the phraseology and in the length of the lines, is twofold. They enable us to fix the interpretation in many instances which would otherwise be doubtful, and they furnish an index for following the growth of the collection itself.

A paper which aroused considerable and lively discussion was one by Dr. A. Ember of the Johns Hopkins University on the Semitic character of Egyptian speech. Egyptologists have for a long time recognized that there are many Semitic elements in Egyptian, but they have been chary of drawing the conclusion that Egyptian belongs to the family of Semitic languages. The question is one of great scientific importance, but it is also a very complicated and intricate problem. Dr. Ember, who has been devoting his attention to this problem for some time, believes that he has found conclusive evidence to prove that Egyptian is a form of Semitic speech. This evidence is two-fold, lexicographical agreement as illustrated by the large number of words in Egyptian that he thinks are unquestionably Semitic, and the regularity of certain phonetic laws of consonantal interchange between Egyptian and Semitic. Dr. Ember was strongly supported in his contention by Professor Haupt who declared that Professor Sethe, the eminent Egyptologist of the University of Göttingen, had also endorsed Dr. Ember's results. On the other hand, Dr. M. G. Kyle

of Philadelphia insisted that most of the Semitic words in Egyptian were loan-words, directly borrowed by the Egyptians from some Semitic speech, while Professor Bloomfield, speaking from the general linguistic point of view, was no less emphatic in expressing the defects in Dr. Ember's method of investigation. Lexicographical coincidences counted for little, especially when these coincidences were brought about through more or less arbitrary assumptions of consonantal changes and transpositions of letters; and, on the other hand, Professor Bloomfield was not convinced that definite phonetic laws applying to Egyptian and Semitic languages had been established. He held it possible that Egyptian might represent a border-speech between a Semitic and a non-Semitic form of speech, just as Lithuanian occupies a somewhat similar anomalous position in the Aryan group. The general impression left by the discussion was that the problem was not yet ripe for a definite solution.

The only Arabic paper presented was by Dr. B. B. Charles of the University of Pennsylvania, who has prepared an English translation of an important biography of Avicenna (Ibn Sina), which is in part autobiographical. Avicenna tells in a quaint and interesting fashion how he was first puzzled by Aristotle's metaphysics until he bought at an auction sale a copy of Al-Farabi's interpretation. There were several papers bearing on cuneiform research. One by Miss Ogden of Albany proposed a tentative explanation of a puzzling list of signs on a Babylonian tablet as being a syllabary intended to elucidate Proto-Elamitic characters prepared as an aid for the study of old Elamitic texts. Professor Jastrow of the University of Pennsylvania discussed the present status of Babylonian-Assyrian chronology, and showed the uncertainty still existing in regard to all dates in Babylonian history beyond 2000 B. C., while in Assyrian history the uncertainty begins when one attempts to fix the reigns of rulers beyond 1500 B. C. The progress in the study of recent years had been chiefly in two directions: in reducing the high dates formerly assigned to early rulers of portions of Babylonia and in establishing many important synchronisms between Babylonian rulers of various districts and between Babylonian and Assyrian rulers. Miss Hoyt of Baltimore, in a paper on the name of the Red Sea, endeavored to show that Strabo's explanation of its name as derived from the red color was, after all, correct, as the water, especially near the shores, is reddened by certain microscopic algæ.

The session of Thursday afternoon was devoted to papers bearing on the History of Religions. Great interest attached to two independent investigations of Dr. W. H. Ward of New York and Prof. George F. Moore of Harvard on the recently published Hebrew texts revealing the existence of a hitherto unknown Jewish sect. Professor Shechter, the editor of the publication, is of the opinion that the sect is that of the Zadokites, or Sadducees, but both Dr. Ward and Professor Moore showed that this view was untenable. Dr. Ward believed he saw closer affiliations with the Pharisees, while Professor Moore properly pointed out that instead of trying to attach to this unknown sect one of the well-known labels, it was more likely that we have before us the documents revealing a sect that is different from those hitherto known. Palestine in the century before Jesus—to which period both Ward and Moore assign the text—was seething with religious fervor, leading naturally to all kinds of religious phenomena. It is also important to note that both Dr. Ward and Professor Moore showed conclusively the impossibility of accepting the views of an English scholar, Mr. G. Margoliouth of the British Museum, who thinks he sees allusions to John the Baptist, to Jesus, and Paul in the interesting text.

The society, before adjourning, took the important step of definitely including in its scope the Historical Study of Religions. With a view of emphasizing this more strongly in the future, it was decided to discontinue the special section for this subject that was established thirteen years ago. In future one entire session will be devoted to papers on the history of religions, including primitive and European religions, as well as the religions of the ancient and modern Orient. The society elected Prof. George F. Moore as president for the ensuing year.

M. J., JR.

THE AMERICAN PHILOSOPHICAL SOCIETY.

PHILADELPHIA, April 22.

Our annual general meeting was held in the hall of the Society, Philadelphia, April 20, 21, and 22. In all there were presented more than sixty papers on scientific and literary topics.

It has been the custom for several years to devote one half-day session to a Symposium on some special topic in science. This year the subject was "Modern Views of Matter and Electricity," and the following papers bearing on this general topic were offered: "The Fundamental Principles," by Prof. D. F. Comstock of Boston; "Radioactivity," by Prof. B. B. Boltwood of New Haven; "Thermionics," by Prof. O. W. Richardson of Princeton; "The Constitution of the Atom," by Prof. H. A. Wilson of Montreal. The general conclusion seems to be that the atom of matter, groups of which compose the molecules of different substances, is built up of much smaller parts, known as electrons, identical with the smallest unit of negative electricity. Sir J. J. Thomson's theory of the atom assumes also a spherical form of positive electricity, throughout which are imbedded the electrons in different numbers according to the kind of atom. It was also explained how it is possible to estimate the actual number of electrons in an atom of any given kind. As the inertia of an electron emitted from the atom of a radioactive substance, such as radium, has been experimentally proved to be a function of its speed, the evidence is strong that all inertia or mass may be electrodynamic in its nature.

Among the important papers on physiology may be mentioned one by Professor Cannon of Harvard on "The Secretion of the Adrenal Glands during Emotional Excitement," in which he stated that these glands and the sympathetic nervous system were intimately related. The sympathetic system innervates the glands, and these in turn secrete a substance that affects bodily structures precisely as the sympathetic system affects them. The sympathetic system is aroused to activity in states of emotional excitement. Examination of the blood of excited animals reveals the presence of an adrenal secretion which was not found in the blood before the excitement. Possibly, this secretion continues the excited state. Possibly, also, the adrenal secretion caused by emotional disturbances has some of the effects produced by injection of the substance, such as glycosuria and atheroma of arteries.

Dr. A. Carrel of the Rockefeller Institute stated the results of some remarkable experiments on the tenure of life in certain tissues when removed from the body and kept in cold storage. These tissues sometimes after an interval of many days have been grafted into the bodies of other individuals and have successfully performed their proper functions.

Dr. Leo Loeb of St. Louis described some cyclic changes of a far-reaching character which take place in the mammalian ovary. They concern the follicles, corpora lutea, and ova. There exists in the ovary a mechanism (in the corpus luteum) regulating those changes. The corpus luteum prolongs the sexual cycle not by retarding the maturation of the follicles, but by preventing the rupture of the mature follicles. His recent observations make it very probable that a partial parthenogenic development of some ova accompany these cyclic changes in the follicles in a certain percentage of animals.

An important paper in engineering was presented by Prof. J. B. Whitehead of Johns Hopkins on "The High Voltage Corona in Air." The author described the limitation to the long distance electrical transmission of power imposed by the insulating properties of

the air, and a new method for determining accurately a voltage at which the air near electric wires and cables will break down; and also gave the results of a series of experiments on the influence of the size of the wire, the stranding of the wire into a cable, the frequency, the pressure, the temperature, and the moisture content of the air.

Several papers on geological subjects were read and discussed, one by Prof. J. J. Stevenson of New York being an introduction to an exhaustive monograph "On the Formation of Coal Beds." Two hypotheses, framed to explain the accumulation of coal in beds, have been in conflict for almost a century and a half. One asserts that the vegetable material was transported by running water and deposited, as were the enclosing sandstones and shales; the other assigns to transport an insignificant share and maintains that the vegetation grew where the coal bed is now found. Professor Stevenson's monograph is in four parts, the last summing up the results of many observations and attempting to show their bearing on the solution of the problem.

Mr. R. P. Field discussed the problem of the "Conservation of Fuel," dealing with the general subject of the utilization of slack coal by making it into small briquettes called "eggettes." The author showed that a binder containing no pitch or any kindred material is preferable for household use, and that by actual test such fuel is cheaper than coal, coke, wood, oil, or gas.

Friday evening, Professor Arrhenius of Stockholm gave an illustrated lecture on "The Physical Conditions of the Planet Mars." The speaker called attention to the many similarities between Mars and the earth which have caused some to think Mars is inhabited, but gave it as his opinion that later investigations are not favorable to this view.

The annual banquet at the Bellevue-Stratford was attended by about one hundred members and guests. Dr. W. W. Keen, president of the Society, acted as toastmaster. Thus ended one of the most successful meetings in the history of the Society.

ARTHUR W. GOODSPEED.

Correspondence

PEACE AND BETHMANN-HOLLWEG.

TO THE EDITOR OF THE NATION:

SIR: The German chancellor has expressed himself on disarmament and arbitration with remarkable clarity and force. He leaves no room for doubt as to the attitude of his government: the reduction of armaments is "a task perhaps ideal, but in practice impossible to execute"; as for the treaty of arbitration, "the moment difficulties arise between two nations, the treaty will burn like tinder." These words cannot fail to have a profound and lasting effect, coming as they do from the centre of armed authority. The Paris *Figaro* comments on the chancellor's discourse before the Reichstag almost with relief, as if it had in a way cleared the air and served precise and unmistakable notice as to the policy of Germany. After this statement, continues the *Figaro*, if the other nations of Europe prefer to trust in the Utopia of a theoretical peace, so much the worse for them.

One cannot accuse Herr von Bethmann-Hollweg of irresponsible jingoism. There is no analogy between the imperial chancellor and Representative Hobson or Gen. Homer Lea. If he declares himself so sharply and emphatically as being, together with Providence, on the side of the big battalions, it must be for reasons of seriousness and weight. It is not necessary to hunt for these in the immutability of human nature, nor in a natural desire of man to slay his neighbor and possess himself of the latter's goods. They can be found on the present map of Europe and in contemporary history. The most superficial acquaintance with the Continental system is sufficient to convince one that it is in a state of unstable equilibrium. The rebirth of the German Empire in 1871 and its subsequent vigorous growth has created a new weight for which no counterpoise has yet appeared. It was made possible by three wars, and its development —perhaps even its existence—has depended on the force of arms; at any rate, no German statesman has been willing to risk the experiment of letting it stand alone, without the support of the "solid frame of a Prussian grenadier."

To admit these points does not mean that one accuses Germany of meditating a policy of further military aggression and conquest. It is not likely that Holland, Belgium, and Luxemhourg are presently to be absorbed. But the existence of the German army, even if it never leaves its garrison towns, endows the nation with an inestimable power in the conduct of its foreign affairs. It is the army which has made Prussia the strongest and the most brutal force on the Continent. The success which has of late attended German diplomacy is not due so much to the death of Edward VII and the inertia of George V—as is contended by the London correspondent of the *Evening Post*—as to the increasing confidence of the Germans in their army as an instrument of diplomatic persuasion. In this connection it might be remarked that the annexation of Bosnia-Herzegovina, which was nothing if not a German success, took place before the accession of George V In Morocco also the Kaiser's voice would have been that of one crying in the wilderness had it not been for his army. And when the Bagdad Railway—"unser" Baghdad-Bahn—reaches the sphere of British influence at the head of the Persian Gulf, the remarks of the German diplomats will have a weight directly proportionate to the number of their regiments and battleships.

In America, where we are so happily isolated from strong and ambitious neighbors, it is easy to underrate, even to overlook, the side of the question of armaments. The *Nation*, in its many articles on international peace, has perhaps made this mistake. An army is no longer solely an instrument of death and destruction. In Germany it is an agent of Imperial expansion. In France it is a sort of national life insurance. If we do not feel the need of an army in either of these latter capacities, it is because of our geographical position. But it is another affair in Europe, where the nations sit cheek by jowl, with the blood of old quarrels dried on their frontiers.

Moreover, M. Tardieu of the *Temps* pointed out some weeks ago that no one nation can propose disarmament without first knowing what corresponding move the others would make; and no council of nations can make a proposal without first knowing what each one is willing to do. Thus the *cercle vicieux* is closed.

On top of this comes the plain statement of Herr von Bethmann-Hollweg that Germany, the pacemaker in the race, cannot and will not disarm or submit to arbitration. One is apt to conclude that Mr. Carnegie's recent investment in peace securities, however great the honor it does him as an idealist, will not increase his reputation as a financier. It was made a few hundred years too early in history. Probably there are few statesmen in Europe who actually thirst for war, but there are still fewer who see the way to universal peace; it could now only be a sort of *pax Romana* —with the eagles at Berlin. SHAKESPEARE AND RALEIGH AGAIN.

TO THE EDITOR OF THE NATION:

SIR: Professor Hanford's letter in your issue of March 30 on the possible connection between a poem probably written by Raleigh and a familiar song in "The Merchant of Venice" is interesting but tantalizing. Certainly the thought and the expression of the two poems are remarkably close, but still not close enough for us to say with conviction that Raleigh imitated Shakespeare or Shakespeare imitated Raleigh. So much of the phraseology of Elizabethan lyric poetry is due to conventions of the age that one hesitates to attach significance to even such parallels as this one.

I am led into this statement by noting, myself, another parallel between certain lines from the poem quoted by Professor Hanford, and these from "Romeo and Juliet," act ii, scene 3:

ROMEO AND JULIET.

Friar Laurence. I must up-fill this osier cage of ours
With baleful weeds and precious juiced flowers.
The earth, that's nature's mother, is her tomb;
What is her burying grave, that is her womb.
. . . Young men's love then lies
Not truly in their hearts, but in their eyes. . . .
Rom. And had'st me bury love.
Fri. L. Not in a grave.
To lay one in, another out to have.

A POESY TO PROVE THAT AFFECTION IS NOT LOVE.

Conceit, begotten by the eyes,
Is quickly born, and quickly dies;
For while it seeks our hearts to have
Meanwhile there reason makes his grave;
For many things the eyes approve,
Which yet the heart doth seldom love.

For as the seeds in spring time sown,
Die in the ground ere they be grown;
Such is conceit, whose rooting fails,
As child that in the cradle quails,
Or else within the mother's womb
Hath his beginning and his tomb.

Whether the second parallel strengthens or weakens the effect of the first, I am un-

able to say, but I believe that they should be taken into account together.

THE PROCONSULSHIP OF GALLIO IN ACHAIA.

TO THE EDITOR OF THE NATION:

SIR: Seneca (Epist. 104) and Luke (Acts 18:12) mention the presence of Gallio in Achaia, and the latter his proconsulship. The date of Gallio's administration has long been a subject of interest, but until recently this could be determined only approximately by inference from the career and writings of Seneca and from the relative chronology of Acts and the Pauline Epistles. The relative chronology of Acts depends largely on the date at which Festus succeeded Felix as procurator of Judea (Acts 24:27). This date, however, cannot be fixed with certainty, and opinion favoring one or another of the years from 56 to 60 has its influence on other inferential dates, and thus upon the date assigned to Gallio's proconsulship. It is of unusual interest therefore to know that an inscription has been discovered and published which fixes this date within the limits of the two years from the spring or early summer of the years 51-52 or 52-53. The inscription was discovered at Delphi and published by Bourguet in "De rebus delphicis imperatoriæ ætatis," 1905. It contains in fragmentary form a letter addressed by the Emperor Claudius to Delphi, in which the number 26 occurs in the address. This is followed by the name of Gallio, and part of the title proconsul. The number 26 is referred most naturally to the acclamation as "imperator" which Claudius received in the year 52 and before the first of August. If the reconstruction of the fragments of this letter by the editor be well grounded, the inscription affords evidence that Gallio was in Achaia as proconsul some time between January and August of the year 52. He may therefore have entered upon his official duties, which doubtless lasted for one year, either in 51 or 52. The text of the inscription is reproduced from Bourguet and discussed in the current (April) issue of the *Princeton Theological Review*.

THE ORIGIN OF THE SPECTATOR.

TO THE EDITOR OF THE NATION:

SIR: I have noticed nowhere in the periodical or daily press any reference to the bicentenary of the *Spectator*. Exactly 200 years ago the first of last month appeared the first of the daily folio sheets which were to exert a powerful influence not only throughout England and her colonies, but even on the Continent. It may be proper at this time to call attention to a common misunderstanding of Steele's share in planning the *Spectator*.

As Steele was alone responsible for the plan of the *Tatler* and as he wrote the account of the club in the *Spectator*, it has come to be rather generally thought that the machinery of the latter paper was his exclusive invention. Statements in many of our histories of literature, while correct, might easily give this impression. It has become almost a commonplace that Steele discovered new lands of which Addison took possession. "Chambers's Cyclopædia of English Literature" says definitely (II, 232): "The idea of the *Spectator's* Club, which is described in the second number, was Steele's invention." A little reflection will, I think, show this to be improbable.

The first issue of the paper was devoted to the Spectator himself, and, for some reason, was by Addison. The next described the club and was by Steele, the two men alternating during the first week and often thereafter. From this beginning it seems highly probable that the Spectator and the club were planned to be the machinery of the paper, and, as the two editors naturally talked over their venture in considerable detail before beginning it, they had undoubtedly decided on the various typical characters who were to form the club. Although very little was ever done with this club, one of its members, Sir Roger de Coverley, is among the chief glories of the paper. To Steele belongs the honor of first describing Sir Roger, but this does not imply that he invented the character. As the genial country squire is the first of the members to be mentioned, and as he has the fullest description of all, it seems almost certain that his character had been talked over with Addison, who may have suggested a good deal. Tickell, Addison's intimate friend, says in speaking of him, "The plan of the *Spectator*, as far as regards the feigned person of the author, and of the several persons that compose his club, was projected in concert with Sir Richard Steele." We know, furthermore, that the first paper, after the introductory one, to deal with the club, number 34, is by Addison; that number 37, also by Addison, contains several references to Sir Roger; and that the first paper to be devoted entirely to the old knight, number 106, is from the same pen. During all this time Steele has mentioned Sir Roger only once, if I am not mistaken, and done scarcely better by the other members of the club. As soon, however, as Addison has begun the Spectator's visit to the knight, Steele writes the next paper continuing the subject. This does not look as if all the inventive ability was "honest Dick's."

RAYMOND D. HAVENS.

University of Rochester, April 14.

A PAID BOARD OF EDUCATION.

TO THE EDITOR OF THE NATION:

SIR: In your editorial columns of April 6 you called attention to the incorporation by Mayor Gaynor in his proposed charter for New York of a provision for a salaried Board of Education. The experience of the city of Washington with such an innovation is a decided warning against the scheme. The plan was faithfully tested here for six years, from 1900 to 1906, and then the system was abolished by Congress without a protest against such action. There were seven members, all men and women of high character and standing, each receiving $500 annually, but the results were unsatisfactory. The defect was not in the personnel, but in the plan. The trial of the scheme proved that there is no function for such a body. If it is the part of wisdom to learn from the experience of others, there can be no excuse for New York to tread this painful path of failure.

C. MERIWETHER.

Washington, D. C., April 18.

TWO ANNOYANCES.

TO THE EDITOR OF THE NATION:

SIR: Two important trifles are daily annoyances.

For several years the *Nation* has put its readers under obligations by cordially coming into our hands with its leaves cut. I wish that the mathematician, practical philosopher, and humorist, who once calculated how many years or decades, or perhaps centuries, of time this saved, would level one of his irresistible arguments at certain of the magazines and reviews, that are, or are supposed to be, much read by students of American history. There may possibly be some excuse for not cutting the pages of publications that are sold on news-stands or in trains; but I cannot see why copies that go to subscribers should not be cut.

For myself, I would about as lief make my coffee, and would much rather fry my chicken, than cut leaves.

All men that use their pens are daily annoyed by the custom of having to write hyphens in words that really do not need to be divided. Why should we forever continue to put a hyphen in *to-day, to-morrow,* and between many words that although once compounded ought long ago to have fused as thoroughly as *barnyard, nowadays, housetop,* and similar words have?

AN OLD STUDENT.

Washington, D. C., April 20.

Literature

BOOKS ON NAPOLEON.

Napoleon in Caricature, 1795-1821. By A. M. Broadley. 2 vols. New York: John Lane Co. $12.50 net.

The Corsican: A Diary of Napoleon's Life in His Own Words. Compiled and translated by R. M. Johnston. Boston: Houghton Mifflin Co. $1.75 net.

Napoleon in His Own Defence: Being a Reprint of Certain Letters Written by Napoleon from St. Helena to Lady Clavering, and a Reply by Theodore Hook. With which are incorporated Notes and an Essay on Napoleon as a Man of Letters, by Clement Shorter. New York: Cassell & Co. $4 net.

The Growth of Napoleon: A Study in Environment. By Norwood Young. New York: Duffield & Co. $3.75 net.

The subject of Napoleon in Caricature has for the first time received adequate treatment in the two volumes of Mr. Broadley. One can find certain chapters on the subject scattered through the works of Champfleury, Dayot, Fuchs, Grand-Carteret, Hermann, and Schulze, but Champfleury, for instance, gives the matter only a hundred small octavo pages out of his five volumes. Mr.

Broadley, while admitting that anything like absolute finality in this line is unattainable, has made wide and careful research and has given us the history and description of a large number of satiric prints concerning Napoleon which appeared in England, France, Germany, Russia, Italy, Spain, Holland, and Scandinavia, between 1795 and 1821. The text is full of curious, precise, out-of-the-way information of value to the historical student and collector; it is richly illustrated with about two hundred and fifty prints, twenty-four of them in color. There is an interesting introduction of about fifty pages by Dr. J. Holland Rose, on pictorial satire as a factor in Napoleonic history. These volumes treat, of course, one of the minor aspects of the history of the time, but they are both instructive and amusing. They present a kind of panorama of European hatred of the great aggressor. The whole of the first volume is devoted to English caricature, significant particularly because of the works of Gillray, Rowlandson, and the Cruikshanks. Napoleon did not cease to be the theme of pictorial satirists even with death. In a final chapter Mr. Broadley brings his subject down to 1910. When England sent her Boer prisoners to encamp on St. Helena within sight of Longwood, a fresh series of caricatures was the immediate consequence.

Mr. Johnston in "The Corsican" has produced a book that will be of considerable interest to those who are not very familiar with Napoleon's range of activity and with his incisive, metallic mode of speech; it contains numerous, disconnected excerpts from his various writings. While the book may be of some profit to the general reader who knows no French, it will be of none to scholars. Indeed, Mr. Johnston indicates in his preface that it has been constructed in disregard of all sound historical method. Such procedure might more properly be left to the amateurs of whom there are many working, with more zeal than discretion, in this field. Apparently, however, the writer supposed that it would not interfere with the purpose of the book, which is to present a "psychological illumination of a great career and character." Mr. Johnston does not indicate his sources except to say that "the matter, with the exception of a few bracketed passages, is derived entirely from Napoleon's own words, written and spoken." The matter, which consists of letters, bulletins, orders, conversations reported by others, has been arranged chronologically so as to give it the appearance of a diary, a peculiar diary, it must be confessed, in that it begins with the hero's day of birth and ends with his last expiring words. The varied material has been pieced togetheed, abbreviated, condensed, sometimes transferred from the day of origin to the calendar date which it is intended to illustrate. There are cases, too, of composite texts made up from several sources. The result is a scrappy collection of Napoleonic utterances, interesting for the most part and generally well translated. Mr. Johnston gives the reader fair warning that he must not consider the events described in the book as objectively true. "For Napoleon rarely, if ever, speaks the truth; yet subjectively how can he speak otherwise?" Most serious biographers of Napoleon have, we judge, proceeded on a different theory, and have considered that while Napoleon frequently lied, he also frequently told the truth, thus creating for them their greatest difficulty, that of extracting, by critical process, the true from the false in the abundant material which he has placed at their disposition.

Mr. Shorter's book, entitled "Napoleon in His Own Defence," consists mainly of a reprint of the "Letters from the Cape," a volume published in London in 1817 and purporting to be written by an Englishman, though it was in reality a translation from a draft dictated by Napoleon to Las Cases. The purpose of the letters was to show England the sufferings of the exiles at St. Helena and to furnish a defence of some of the episodes in Napoleon's career which had been criticised—the execution of the Duke d'Enghien, the treatment of the Spanish Bourbons, the return from Elba. They reveal the skill with which Napoleon used his enforced leisure for starting on its prosperous way the so-called "legend." The letters are out of print, and Mr. Shorter has now republished them on excellent paper and in excellent type. Why he has considered it important to do this we do not see, but at any rate he has done it well. He has added the reply to these letters, entitled, "Napoleon in St. Helena," by Theodore Hook, a scurrilous and contemptible pamphlet which might properly be allowed to remain in the oblivion where it belongs. Mr. Shorter has prefixed to the two reprints an essay of his own of about thirty pages on "Napoleon as a Man of Letters," an essay chiefly important as showing the uncritical attitude of an incorrigible idolator whose sobriety of judgment is sufficiently attested by his remark that Napoleon in his treatment of Madame de Staël "carried courtesy and self-restraint to their utmost limit," and that his permitting her to reside in Switzerland is a proof of his "genuine respect for letters." After this one reads the entire essay without shock and with fortitude tempered by hilarity.

Norwood Young's book is, he tells us, "the first original study in English of the influence of his environment upon the growth of Napoleon." The author does not appear to be acquainted with Oscar Browning's "Napoleon, The First Phase," an excellent study of the youth of that person. But although his book may not be the first on the subject to appear, no reader will deny that it is original. We do not have to go far into it in order to get its true, individual flavor. Starting with the thesis that Napoleon was unmistakably and always Corsican, not French, he says that this Corsican character must therefore have been formed in him during the first nine years of his life, as at the end of that period he went to France. Unfortunately, "very little has come down to us of the childhood of Napoleon from those persons who were witnesses of it." But this paucity of information, far from daunting our author, gives him his great chance to make a remarkable contribution to his subject, which is briefly this: "It is on his companionship with Joseph that the whole growth of Napoleon hangs. If we had no other proof we should know that Joseph was the elder and Napoleon the younger, from the adult characters of the two men. There never was a more obvious eldest son than Joseph, or a more certain second son than Napoleon." The reason is this: "Position, in age and sex, relatively to the other nursery mates, is, after the mother's or nurse's personality, the chief factor in the development of a human being." Now the eldest child having no one to imitate and being easily superior to the other children, tends "normally" to grow into an "indolent, self-satisfied, mild, and capable man." The second, however, ambitious to equal the first who is a constant challenge to him, becomes active, aggressive, and conceited. His desire to dominate becomes inordinate. There you have them—Joseph and Napoleon. It is true that time "steadily lessens the proportional age advantage of the elder brother," nevertheless, "its influence will never die; the cleavage in differentiated character it has produced is permanent and portentous."

Let no one imagine that this great scientific principle merely happens, by a kind of lucky chance, to be illustrated by Joseph and Napoleon. Mr. Young shows how in its inevitable operation it produced the rest of that astonishing family, Lucien, Elise, Louis, Pauline, Caroline, and Jerome (pp. 206-209), each just the character you would expect from the position in the series and from the sex. It reminds one of a Baconian cipher in its ability to make obscure things clear. Mr. Young is evidently pleased with his virtuosity in this new science of environment, for his main thesis is wearisomely reiterated all through the book and confidently reaffirmed on the last page. If Lamartine succeeded, as Dumas said, in almost raising history to the dignity of romance, Mr. Young has succeeded in giving it something of the cheerful pleasantry of farce, though there is no evidence that such was his intention. His book ought to be welcome to all who

like their history in the form of assertions and generalizations, unsupported by evidence. It ought also to arouse enthusiasm among all second sons, of whom there must be many in the world who are unconscious of their priceless heritage.

CURRENT FICTION.

While Caroline Was Growing. By Josephine Daskam Bacon. New York: The Macmillan Co.

Fully a decade ago Miss Daskam showed her adroitness in interpreting the humors of childhood. One or two of her stories in this kind—"The Madness of Philip," for example—remain in a memory upon which few short stories find lodgment. There was, perhaps, a hint of sharpness in the best of them—more enjoyment of infantile absurdity than sympathy with it. This is not at all true of the writer's later child-stories. The present series may be described as a study of little-girlhood by a lover of little girls. Some of the adventures in which Caroline is involved are rather far-fetched. It must be owned that she is incredibly the *dea ex machina* in certain events recorded. So much Mrs. Bacon has yielded to the conventions of child-fiction. It would almost seem that a new motto should be admitted for this type of story—say, "A little child shall push them." In real life children do not as a rule undertake the management of adult affairs with success. Johnny does not always save the train, Elsie sometimes fails to reform her erring father. But the general principle is one which we should hardly know how to spare. Mrs. Bacon does not push it to its extreme. If Caroline softens the heart of the prima donna, and saves the burglar from arrest, these are merely incidents in her career. The most charming of the tales, "An Idyl of the Road" and "The Ends of the Earth," are built of the simplest materials. Caroline is not represented as complacently superior to her elders. She is a normal and lovable child, with plenty of faults—a much safer person for other children to associate with than the prigs and pert misses too often presented in the current "story for girls."

Captivating Mary Carstairs. By Henry Second. Boston: Small, Maynard & Co.

We surmise that the writer is a literary sophomore who has spent his summer vacation reporting for a city paper. No other hypothesis will explain this combination of urbane condescension, sanguine—not to say sanguinary—idealism, and profound disdain for all that is dull and probable. With a nonchalant assumption of plausibility it is related how, to oblige an elderly friend, two New York clubmen undertook to kidnap his child from a small town up the Hudson, and how, the child proving to be a beautiful young woman, the kidnapping was happily converted into a courtship. The main business of the expedition is conducted by Laurence Varney, well-mannered, well-tailored, and chivalrous. He treats the capricious but ever lovely Mary with a respectful consideration that is beyond reproach. His ally, Peter Maginnis, is a millionaire with the physique of a Titan and the manners of a spoiled football celebrity. Maginnis is to Varney what Porthos was to D'Artagnan—a colossal reservoir of strength and illimitable devotion. While Varney is occupied by the problem of captivating Mary, Maginnis puts in his time electing a reform mayor for the little town, and buying a newspaper, until the inevitable opportunity arises to exercise his "passionate muscularity" and save Varney from the infuriated mob. On that occasion "Peter stood alone in the little lawn, dark figures of his enemies stretched here and there about him, his great arms clutching the inert body of his friend, groaning his pain to the four winds." The way to these epic heights is paved with an extraordinary amount of worldly wisdom and smart phrasing. We remember in particular the "little runt of a boy" who "made the air noxious with the *relicts* of a low-born cigar."

The Justice of the King. By Hamilton Drummond. New York: The Macmillan Co.

The King is Louis XI, and his justice is of the sort that Scott and Henry Irving have indelibly fixed on the mind of to-day. The novel belongs to the laboriously compounded type, its predicaments long drawn out, its phrasing conventional in the familiar manner of "muffled rhythm of galloping hoof-beats sounding through the roar of the blood swelling his temples and booming in his ears like the surf of a far-off sea." Philip de Commines figures prominently in the pages, and François Villon and the Dauphin. But the young hero and heroine are Stephen La Mothe and Ursula de Vesc, who are, so far as one may discover, creations of the novelist. Mr. Drummond does not call his story an historical novel, and therefore it may not be criticised as to accuracy. For the reader, however, it is perforce fictionized history, or historiated fiction, and he is led to inevitable reflections on the matter—to wonder whether the blessed word Mesopotamia, or its equivalent in history, carries the victory over distortion of truth and invention of motive. Miss Mühlbach's way was safe—to affix a star to each fact; nor were her pages thickly starred. Some such warning would render immune many modern historical novels. Let it be added that in comparison with much cheap, weakening stuff provided as light reading, even a story like this, with more sugar than pill, is to be cherished. At least it circles about realities, and has entire dignity of manner. Perhaps one in ten who read it will be moved to study at its sources the history of the period.

Glamourie: By William Samuel Johnson. New York: Harper & Bros.

A tenuous plot, an eccentric personnel, and a style of studied whimsicality mark this tale as a product of industry rather than of inspiration. The central figure has a number of authentic claims upon the interest of the romantic reader. He is not only an Irishman, but a baronet, not only a baronet, but a hunchback. Two passions consume him, a hopeless love for a beautiful young cousin, and an insatiable worship of Paris. Dithyramb, rather than incident or action in any sense, fills these pages. The author's real impulse seems to have been to celebrate the strange and conquering charm of his wonderful city. So much the worse for the story, whereof it may suffice to say that Sir Michael Burke and the beautiful cousin remain at intimate removes, until his not untimely death, and that she not unexpectedly becomes the wife of the young New Englander, to whose care Sir Michael has consigned her. If the reader is able to believe in Sir Michael as a species of twentieth century Cyrano, and to share in his verbal and emotional debauches, he will happily disagree with our opinion of the book as a piece of strained artifice. It is by no means lacking in cleverness: but is not cleverness the bad angel of our current fiction?

LIFE IN THE EIGHTEENTH CENTURY.

Annals of a Yorkshire House: From the Papers of a Macaroni and his Kindred. By A. M. W. Stirling. With illustrations. 2 vols. New York: John Lane Co. $10 net.

The editing of family chronicles and memoirs is becoming more and more recognized in England as a distinct field of literary industry, and works which for the most part are due to the lettered ease of amateurs appear with increasing frequency. Now it is "Annals of a Yorkshire House," whose author, having previously performed a similar service for another kinsman in his "Coke of Norfolk and His Friends," here presents a selection from the journals and correspondence of his great-grandfather, Sir Walter Spencer-Stanhope. Born in 1749, this friend of Burke and Fox, Pitt and Wilberforce, who, as a youth, figured largely in fashionable London society, and who, for forty years, held his seat in Parlia-

ment, was the son of Walter Stanhope and Ann Spencer, representatives of two old Yorkshire families whose respective heads, John Stanhope and John Spencer, or, as they were commonly known, from the names of their seats, John of Horsforth and John of Cannon Hall, were typical examples of the English squirearchy in the eighteenth century. The latter house, which is situated in the West Riding of Yorkshire, and which is the habitation indicated in the title of the work, is a mansion of venerable antiquity, and had already had a long and romantic history before it came into the possession of the Spencers in the days of Richard Cromwell and Charles II. A Saxon Thane named Ailric had a dwelling on the site as early as 1066, and for centuries a house has stood there and borne the same name which it bears to-day—a name in all probability derived from the ancient family of Cannun or Cannell, who are mentioned in a deed of the reign of Edward I, and from whom the property was purchased by one Thomas Bosvile in the fourteenth century. On inheriting Cannon Hall and a large fortune from his maternal uncle, young Walter Stanhope prefixed the name of Spencer to his own patronymic, and became the founder of a family in whose possession the mansion continued.

Here, in the account of a large family connection, the house itself serves excellently as a gathering point for the numerous and divergent threads, and we are continually brought back to its stately rustic peace from French court festivities, London clubs, and American battlefields. Still, it is in the personal career and brilliant associations of its heir that interest is principally centred. He is described on the title-page and pictured in the frontispiece as a "Macaroni," and he seems to have been one of the leaders in that set (at its zenith between 1772 and 1775) which sought to achieve foreign distinction by the elegant eccentricity of its attire—"coats cut extremely short and made to fit their persons closely, an enormous knot of hair at the back of their heads, a very small cocked hat, and a long walking-stick with very large tassels." But although Stanhope was by no means averse to the fashionable frivolities of the time, and frequented the gaming-table with as much assiduity as Fox, if with greater success, he was by no means merely a trifler. He had entered Parliament at the age of twenty-five, and took part, as a member of the Opposition, in the great debates on the American Revolution. To these he listened with an appreciative ear for the quality of the oratory displayed, and not the least valuable part of these memoranda is his record of the impression produced on him by the galaxy of speakers then in the two houses. For Burke, his close friend, he had a particular admiration, and he records a number of anecdotes of that statesman. One, the least flattering, since it represents Burke struck dumb for once, after an unusual display of violence and bad taste, is too curious not to be given here. The incident occurred at the examination by a committee of the House of the royal doctors who asserted that George III was mentally incapable, but, in their opinion, curable. Burke, who was an ardent advocate of the Regency, attacked the physicians fiercely on their introduction:

> Dr. Willis, about to commence his report, suddenly turned round, and, addressing the excited statesman personally, preluded his remarks with the sentence—"I will tell that honorable gentleman"—at the same time fixing upon the offender one of those glances with which he was accustomed to control the deranged faculties of his fellow-men. To the astonishment of those who witnessed it, Burke sank back under that glance, strangely cowed, and the eloquence which was wont to sway senates was hushed to silence beneath the all-compelling glance of a doctor of lunacy.

That Burke was not always above petty jealousy is attested by Stanhope, who recounts that once, having heard Grey speak "excellently well, he praised the effort to Burke, as they left the House together, but added that "it was in some degree borrowed from Cicero's oration against Verres." "Yes," agreed Burke grudgingly, "*panni*, indeed there are—but *not purpurei!*"

Other orators of whom Stanhope gives his impressions are Pitt and Sheridan. Side by side with these great figures in his anecdotal account of the history that was made from day to day in those times, appear others, grotesque and half-forgotten, save when, as in the case of Michael Angelo Taylor, immortalized by some satiric pen or pencil. Taylor, who was depicted by Gillray, was a pompous, self-important little man, and served as a constant butt for wags and practical jokers like Sheridan. One of his traits was a profound snobbishness:

> One Sunday in church when the clergyman who was reading the prayers came to the words, "George, Prince of Wales," Michael added in an aside designed to be audible to those about him, "By the way, he dines with me next Thursday." On another occasion when he was going to receive the Prince at the country house he then occupied, one of his friends mischievously observed to him with an air of commiseration, "Michael, it must be a great bore and expense to you to have to receive the Prince." But Michael was equal to the occasion: "Sir," he replied casually, "my establishment is such that one or two odd comers popping in make no difference!"

While Walter Stanhope-Spencer was engaged in opposing the policy of Lord North in Parliament, he and other members of his family were in constant receipt of letters from friends and relatives in the English army, in the rebellious colonies, which, no doubt, did much to confirm the judgment of the young statesman as to the error of this policy. From these letters, it is seen how clearly the struggle thus brought about and persisted in, appeared to enlightened contemporary eyes as civil warfare. There is in them a note of gloomy discouragement and listlessness that is very different from what one would expect in the letters of sanguine, headstrong, British soldiers, and that could not have arisen solely from the difficulty of their precarious position. These letters "from the front" afford intimate glimpses of the contestants on both sides at many critical points, and it is to be hoped that, if Mr. Stirling has omitted any of them in making the selection which was rendered necessary by the wealth of the archives of Cannon Hall, he will print the remainder in some form at some future date. His next work, however, he announces, will relate to the time when the Spencer-Stanhope and Coke families, with which his two works, already published, deal separately, became united by marriage, as they did in the next generation.

The Riders of the Plains: Adventures and Romance with the Northwest Mounted Police, 1873-1910. By A. L. Haydon. Illustrated with photographs, maps, and diagrams. Chicago: A. C. McClurg & Co. $2.75 net.

Here is a volume well fitted to interest a large number of readers simply as entertainment. It might well have a far wider reading by a class to which it would mean much more than entertainment, if ears were only open to its many lessons and suggestions. If the scores of thousands of men carried on the police rolls of our large cities could develop a fourth part of the courage, the practical efficiency, the broad-minded conception of their opportunities for service, and the self-sacrificing devotion to duty characteristic of the Canadian Northwest Mounted Police throughout its history, the safety and comfort of city life would be enhanced almost beyond imagination.

This remarkable body of men was organized in 1873, under the provisions of an act introduced into the Dominion Parliament by Sir John Macdonald, who surely rendered a great public service in this particular, however open to criticism his ideas of Canadian policy may have been in certain other respects. The new force was only beginning to reach the field of its labors when the political crisis of 1873 threw Premier Macdonald and his ministry out of power, and for five years its management was in the hands of the Cabinet headed by the Hon. Alexander Mackenzie. We know only too well what such a break in party continuity might have meant in the organization of a new police policy on this

side of the line, but neither then nor at any time since has the management of the Northwest Mounted Police been caught in the cogs of party machinery. Herein, doubtless, lies the main secret of its exceptional efficiency.

The Indians, of course, furnished one of the first problems with which the police had to deal. Degenerating as they were under the influence of renegade whites and half-breeds whose main source of revenue was the illegal traffic in liquor, their own leaders were quick to recognize the salvation which the coming of the mounted police offered. At a subsequent treaty meeting, this feeling was well expressed by Crowfoot, chief of the Blackfeet: "If the police had not come to the country, where would we all be now? Bad men and whiskey were killing us so fast that very few, indeed, of us would have been left to-day. The police have protected us as the feathers of the bird protect it from the frosts of winter." On one occasion this same Crowfoot was much incensed to have some of his braves arrested for disorder and taken off for trial before the court of the police. Curiosity led him to follow and observe the proceedings, which were carefully interpreted to him. When it was all over, his comment was: "This is good medicine. There is no forked tongue here. When my people do wrong, I will bring them here to be tried." The view of the liquor traffic taken by the wiser among the Indians is well illustrated by a few words which the author quotes from a treaty speech of Button Chief, of the Blood tribe: "The Great Mother [Queen Victoria], sent Stamixotokon [Colonel Macleod] and the police to put an end to the traffic in fire-water. I can sleep now safely. Before the arrival of the police, when I laid my head down at night, every sound frightened me; now I can sleep sound and am not afraid." One cannot read the chapter dealing with the Sioux invasion of Canada, in 1877, by Sitting Bull and his followers, without the strong impression that the whole trouble would have been avoided had the Indians on our side of the border been under any such benign influence as the police management of the Canadian tribes. Before the crossing of the border, the Sioux had sent a messenger to the Canadian Blackfeet, with a piece of tobacco to be smoked, if they were willing to come over and join in the fight against the United States troops. "We cannot smoke your tobacco on such terms," was the answer. "The whites are our friends, and we will not fight against them." The rebellion stirred up by the French half-breeds in 1885, under the lead of Louis Riel, marred the relations of the government with the Indians for a time, but the situation would certainly have been worse except for the twelve years of honest and helpful police administration preceding, and the force proved an invaluable adjunct in restoring order and peace of mind after the storm was over. The author does not hesitate to admit that the Canadian authorities had been seriously at fault in dealing with the claims of the half-breeds, thus giving a substantial basis to the agitation which afforded Riel his opportunity.

Scanty as the force has always been, its members have performed notable service of various kinds. Their aid in preventing and extinguishing forest fires alone has probably far exceeded the cost of their maintenance. They have frequently rendered service as mail-carriers. House-to-house visitations are made among sparsely distributed settlers, and sickness or trouble of any kind always receives the necessary aid. Special patrol work taking any member of the force into comparatively unknown territory is followed by detailed reports, through which a large amount of useful data has been accumulated. We might add still other lines of usefulness, but it is better simply to say that any member of the Northwest Mounted Police who is true to the well-established traditions of his force is ready at all times for any service which the call of duty or humanity requires. Mr. Haydon's volume is full of incidents of thrilling personal bravery. Police service in the Canadian Northwest is not a calling in which a coward could hold his place for a single month. It takes genuine courage for three men to go two days' travel into the wilderness, pick a desperate horse-thief out from among a band of eighty half-breeds and take him away for punishment, with chances for ambuscade almost every mile of the way, but there is nothing unusual in such a feat as that. On one occasion Constable Pedley was detailed alone to convey a raving maniac from Fort Chipewyan to Fort Saskatchewan, a five-hundred-mile journey, in the dead of winter. At one time, during a terrible gale, he was obliged to lash himself and the madman together to a tree for several hours. One is not surprised to learn that the successful accomplishment of his task was followed by a spell of insanity on his part, though he afterward recovered.

One feels inclined to call this volume urgently to the attention of those responsible for the police administration of cities like Chicago and New York. To get into the New York police force, from the head down, something of the genuine efficiency of the Northwest Mounted Police, something of its freedom from collusion with the crime which it is employed to check, its inaccessibility to paralyzing political complications, and its sympathetic spirit of helpfulness to those who are under its jurisdiction—how much loftier a task this would be for the Mayor of a great city than to burn his midnight oil in the endeavor to keep the force as it is from subjecting a few comparatively innocent citizens to the annoyance of arrest for trivial offences. Give us the larger, fundamental reform, and the other would immediately follow as one of its unimportant by-products.

The Truth About Spain. By G. H. B. Ward. New York: Cassell & Co. $2 net.

Such a title does not prepare the wary reader for the *whole* truth, and it is, indeed, easy to discover that the author writes with strong prepossessions. His theme is the entire complex of modern Spain, social, religious, and political, and Mr. Ward frankly takes the standpoint of a thoroughgoing radical. This does not necessarily lead him to color his facts, but it does betray him into selecting them for the purposes of his argument, and the result is inevitably to make his book appear more like a special plea than a dispassionate report of actual conditions. One does not need to be prejudiced in favor of the Church in Spain, for example, to feel that Mr. Ward's sweeping attacks upon it fail of revealing it as it really is to-day in the life of the Spanish people. His tone is in general pessimistic as regards education, the press, and parties in the Peninsula, and he would evidently agree with those Spaniards who say there is no hope for their country except in root-and-branch reform. Yet when one makes due allowance for the *parti pris* of the author, his pages can be read with a good deal of profit. He has brought together much interesting information, and many of his views are eminently sound—such as those concerning the vicious "boss" system in Spanish politics. On the other hand, his chapter on Spanish newspapers is too severely condemnatory, partly on account of not sufficiently abating for the differences between Spanish and English journalistic practice and habits. On the question of Spain's relations with the Vatican Mr. Ward would be far more aggressive than Canalejas, whom he nevertheless highly praises. All told, his book is one to be read with interest but with caution.

The Country Church and the Rural Problem. By Kenyon L. Butterfield. The University of Chicago Press. $1 net.

The "back to the farm" movement has resulted in renewed interest in the country church, of which the Carew lectures at Hartford Theological Seminary, by President Butterfield, are an indication. Dr. Butterfield approaches the question in the interest of rural society and agricultural welfare, and not primarily in the interest of the church. His attention to religious work among country people is due to his conviction that the rural problem, which he says is "to

maintain upon our land a class of people whose status in our society fairly represents American ideals—industrial, political, social, and ethical"—can be solved only with the help of the church. In fact, he declares that "the problem of the country church is the most important aspect of the rural problem," and he looks to the church to accomplish more for the promotion of agricultural welfare, in the larger sense, than any other agency.

The task of the country church under this conception of its mission is declared to be the enlargement and enrichment of ideals in the rural community under the inspiration of the religious motive, and the work of the country minister is outlined in accordance with this principle. The attractiveness of the profession of the rural parish minister is set forth with enthusiasm, and Dr. Butterfield calls for men to devote themselves to religious work in the country as a life mission, suggesting special training for this phase of the profession, in which it is proposed that the State agricultural colleges may have a part.

If these new country preachers should become a reality, and should be found encouraging scientific agriculture, reforming school houses, and inculcating better drainage, St. Paul might have difficulty in recognizing his apostles, and some quiet souls would doubtless look with longing to the parish priest after the mind of George Herbert; but new occasions teach new duties, and the institutional church of the city has its parallel in the country church after the order of President Butterfield.

Notes

The Gutenberg, or 42-line Latin, Bible was purchased on Monday evening, at the Robert Hoe sale in this city, by Henry E. Huntington, for the extraordinary sum of $50,000, which is more than twice the amount which any previous copy of this edition has ever brought. The Bible is on vellum; there are said to be but seven copies in existence, one of which is owned by J. P. Morgan.

The Macmillans have in the press three novels, "The Legacy," by Mary S. Watts; Owen Wister's "Members of the Family," and "The Sovereign Power," by Mark Lee Luther; also "The Aspects of Islam," by Duncan B. MacDonald, and "The Ladies' Battle," by Molly Elliot Seawell.

The announcements of Little, Brown & Co. include: "The Early History of Jacob Stahl," by J. D. Beresford; "The Moving Finger," by E. Phillips Oppenheim; "The Old Dance Master," by William Romaine Paterson; "To Love and to Cherish," by Eliza Calvert Hall, and "The Danger Zone," by H. Charles Woods.

The following eleven titles have been added this spring to Everyman's Library (Dutton): "Autobiography of Edward Gibbon," with introduction by Oliphant Smeaton; "Essays on Education," by Herbert Spencer, with introduction by C. W. Eliot; "Crime and Punishment," by Fedor Dostoieffsky, with introduction by Laurence Irving; "Charles Auchester," by Elizabeth Sheppard, with introduction by Jessie M. Middleton; "Virginians," by W. M. Thackeray, Vol. I, with introduction by Walter Jerrold (in 2 vols.); "Virginians," Vol. II; "Toilers of the Sea," by Victor Hugo, with introduction by Ernest Rhys; "The Ring and the Book" by Robert Browning, with introduction by Charles W. Hodell; "The Old Yellow Book," with introduction by Charles W. Hodell; "The Select Plays of Beaumont and Fletcher," with introduction by Prof. G. P. Baker, and "Anson's Voyages (Around the World in 1742)," with introduction by John Masefield.

For the occasion of the coronation Messrs. Jack of London have photographed in colors a complete series of portraits of English sovereigns from the Conquest to George V, which are to be issued in one volume; and Eyre Pascoe has written to accompany the photographs a series of historical notes.

George H. Brennan has placed with Mitchell Kennerley his new novel, "Anna Malleen."

Among the books for which Houghton Mifflin Co. invite immediate orders are "A Melody in Silver," a romance of a country doctor and a spinster, by Keene Abbott, and "Reminiscences of an Athlete," by E. H. Clark.

"The Good Old Days," by Charles W. Bell, which McClurg is publishing, is a plea for simplicity.

Badger announces "A Knight of the Golden Circle," a copperhead story by U. S. Lesh, and "Hunting Indians in a Taxicab," by Kate Sanborn.

"The Shadow of Love," by Marcelle Tinayre; "A Wilderness of Monkeys," by Frederick Niven, and "The Valley of Regret," by Adelaide Hope, are to be issued shortly by John Lane Company.

"The Trail of the Axe," by Ridgwell Cullum, which Jacobs & Co. have in hand, is a story of the lumber camps.

The list of forthcoming books of Sturgis & Walton contains "The Suffragette," by E. Silvia Pankhurst.

Forthcoming books of Cassell & Co. include: "A Kingdom of Dreams," by J. J. Bell; "The Unknown Isle," by Pierre de Coulevain; "Twin Sisters, by Richard Marsh; "The Yoke of Circumstance," by Helen Wallace; "The Bird-Folk at Home," by May Byron; "The Sun's Babies," by Edith Howes; "The Truth About Egypt," by J. Alexander, and "Mind and Its Culture," by the Rev. R. P. Downes.

At a meeting of the council of New York University it was announced that Dr. Elmer Ellsworth Brown, United States Commissioner of Education, had been chosen chancellor to succeed Dr. Henry Mitchell MacCracken, who resigned last September after serving in this position for twenty-five years. Dr. Brown was born in 1861, he graduated from the University of Michigan in 1889, and received his Ph.D. from the University of Halle-Wittenberg, Prussia. He was appointed Commissioner of Education in 1896, while he was a professor in the University of California.

A new and revised edition of L. H. Bailey's "Outlook to Nature" (Macmillan) brings that combination of practical and sentimental reflections once more before the public.

"The Gleam" (Holt), by Helen R. Albee, might be called the autobiography of a soul—a record of the development of the spiritual instinct from its dawn in a child of six to its fruition in a woman of forty-seven. It is told with sincerity and simplicity, with a childlike frankness, and at the same time great reticence in all matters except those of the spirit, and also with an astonishing lack of what is commonly called egotism. A quotation from Plotinus in the first paragraph embodies the central motive of the book: " . . . the flight of the alone to the Alone." There are glimpses of keeping house under difficulties, of disappointments and disasters, of warm friendship and a beautiful marriage. One chapter gives an interesting sketch of the genesis of the Abnakee rug industry, and another unveils the things in flowers and plants that escape the common eye. Those interested in psychic experiences will find matter here that piques and holds the interest, and that larger body intent upon some way of escape out of the limitations of daily living and the difficulties and disorder of daily thinking, will find "The Gleam" practically helpful and illuminating.

An East African traveller whose aim was not big-game hunting or exploration of unknown regions, or the study of the natives, but simply the enjoyment of seeing a strange part of the world, is rare. But such an one was the distinguished surgeon, Sir Frederick Treves, who, in "Uganda for a Holiday" (Dutton), describes an interesting journey which included a *safari* trip in the great rift valley and a voyage around the Victoria Nyanza. The various incidents are told, the wonderful scenery is pictured in such a way as to make the reader feel that he is making the journey himself with a very agreeable and intelligent companion. The chapter on the sleeping sickness is the best and most instructive account of this terrible plague which we know. It is encouraging to learn that as a result of protective measures the deaths from the sickness "in the kingdom of Uganda have been reduced from 8,003 in 1905 to 975 in 1909." The title, it should be added, is misleading, for the writer's experience in Uganda proper is limited to a visit to the administrative and native capitals and the Ripon Falls, which is described in the last thirty pages. There is an excellent map and seventy-two reproductions of the author's photographs.

The "History of the French Academy" (Dillingham), by D. Maclaren Robertson, is an eminently respectable survey of the annals of the Forty, or, to include dead as well as living, the 515 Immortals. The volume traces the story from the days of Conrart and his intimates, and the negotiations with Richelieu by means of the "plaisant abbé de Boisrobert," down to the present time. It includes the great "sensations," such as the quarrel of the "Cid," the quarrel of the ancients and moderns, the expulsion of Furetière for cribbing from the unpublished dictionary, the epic contests of the eighteenth century in which the *philosophes* had their share, and many other incidents. A whole chapter is devoted to the dictionary. Perhaps, in so comprehensive a survey of the functions of the Academy information might have been given of the

numerous prizes awarded under its auspices. A complete biographical list of the membership adds to the value of the volume for consultation. It brings back to us, among famous names, those of numerous forgotten worthies:

Mais j'en vois plus d'un membre;
Voici Boudu, Boissat, et Cureau de la Chambre,
Porchères, Colomby, Bourzeys, Bourdon, Arbaud—
Tous ces noms dont pas un ne mourra, que c'est beau!

"The Romance of Monaco and Its Rulers" (Lane) is Miss Ethel Colburn Mayne's modest title for a comprehensive and scholarly history of Monaco from the time of its first name, Hercules Portus—derived from its fabulous discovery in the sixteenth century before Christ by the Greek or Phœnician Hercules—down to 1910, including much about other countries during whatever period Monaco was associated with them by conquest, theft, or sale. The adventures of the Grimaldis—Monaco's present rulers, who first appear with the expulsion of the Saracens by William Count of Provence in 792—form the romance of the book. These Grimaldis are soldiers, troubadours, misers, spendthrifts, bullies, cowards, faithful friends, and dauntless enemies, as petty and picturesque, as noble and as base, as Monaco's history. Their authentic rule did not begin until 1338, when Charles Grimaldi, called the Great, bought from Niccolo Spinola in the marketplace of St. Luke, at Genoa, for 1,280 golden florins, "the lands, houses, and 'immovable property'" which Charles II of Anjou had presented to the great Ghibelline family. This is only one of the sales with which the names of Grimaldi and Liguria are associated. In 1861 another Charles Grimaldi—Charles III, father of the present reigning prince—sold Mentone and Roccabruna to France for four million francs, thereby securing his undisputed title to the principality of Monaco. There is still another, and a most infamous sale, that of 1870, when François Blanc bought, from this same Charles, principalities and princes for a term of sixty years, a term which in 1898 was extended for fifty years from the August of 1898. And yet, though Monaco is known now only for its beauty, and as the spot where "every weakness and every vice of poor humanity is turned to the account of the Tables and their owners," it has been associated, and not ignobly, with momentous events in the history of nations. The horror and drama of the Holy War, the labyrinthine struggles of the Guelphs and Ghibellines, the wars of the Spanish succession in France, the French Revolution, the unification of Italy, move through this chronicle of the "little, ancient, storied Hercules Portus." Out of this tortuous maze the author has evoked law and order, and presented clear of entanglements a coherent and vivid story. The volume is an example of bookmaking that pleases the eye in its illustrations and binding, economizes the attention in the clearness of its type and paper, is well indexed, and has well-arranged notes and authorities that can be easily verified.

"The Land of the White Helmet" (Fleming H. Revell) is the outcome of the experiences of Edgar A. Forbes during a year in Northern and Western Africa. They began in Tunis and Algeria and ended in Sierra Leone and Liberia. The best part of the book is that relating to the French dominions, and furnishing information as to the wise way in which the natives are being governed and the resources of the country are being developed. The writer is enthusiastic in his praise of "the splendid engineering triumphs in railroading and harbor construction; the two thousand miles of beautiful roadway that cuts even through the hills of Kabylia; the electric lights and tramways and telephones; the seven hundred post offices handling seventy million pieces of mail a year; nine thousand miles of telegraph line transmitting three million messages annually." Interesting, also, is what he has to tell of Morocco, though he was for a short time only in Tangier and Casablanca. At this latter place he found a Connecticut sea captain who had been shipwrecked thirty years before off the coast, and had never gone home, but was running a saw-mill and a flour-mill combined, "an antique on an antiquated shore." The impression made upon the reader concerning the present condition of Liberia is not favorable, as is apparent from the following incident: On the grave of a native king was "the star and stripes of Liberia flying from a thirty-foot bamboo staff, with the empty rum-jug perched on top!" There are forty-eight reproductions of photographs and eight diagrammatic maps, but an index is wanting.

"Home Rule—Speeches of John Redmond, M.P." (Stokes), edited with an introduction by R. Barry O'Brien, contains the most important speeches delivered within the past twenty-five years by Mr. Redmond in the House of Commons and elsewhere on Home Rule and allied subjects. From the very first he took the position that Ireland was entitled to Home Rule, not merely because the Dublin Castle rule had proved to be a failure, but also because a community having distinct historic traditions and distinct natural characteristics has a right to self-government. But while in his earliest speeches the greatest stress was laid on the fact that the unjust treatment received at the hands of England had resulted in absolute disloyalty, in more recent years the principal argument has been that the granting of free institutions would result in making Ireland a loyal part of the Empire. In one of the most recent utterances the present condition in South Africa is referred to with great force in bearing out this contention. The change in tactics explains to a considerable extent the revulsion in feeling among the English electorate. The evident good faith, shown in his recent utterances toward the Ulster opponents of Home Rule; his willingness to agree to every provision securing to the Protestant minority the guarantee that their rights would be respected, also powerfully contributed to the same result. If Ireland obtains Home Rule it will be due to a considerable extent to the wisdom and good statesmanship shown by Mr. Redmond as leader of the Nationalist party.

A third edition of the "Riddles of the Sphinx," by Dr. F. C. S. Schiller, the Oxford pragmatist, has been brought out by Macmillan. The first was published anonymously in 1891, and the second three years later (with the author's name attached), while he was still teaching in Cornell University. The present edition is of rather more interest than is the usual revision, owing to Dr. Schiller's discovery of "Humanism" (which is English for Pragmatism) since the second edition appeared. In fact, considerably more alteration might have been expected from Dr. Schiller than he has actually made, for in his eyes the rise of Humanism throws a new light on every problem of philosophy and is comparable only with the rise of Darwinism in biology. As a fact, however, the greatest changes which appear in the new edition of the "Riddles" are to be found in the preface and the appendix. In the former the influence of Humanism on metaphysics is dealt with in a general and interesting way, while in the appendix are printed two recent papers of the author's entitled "Choice" and "Science and Religion." In the body of the book one finds retained a rather surprising amount of old-fashioned metaphysics, in spite of the author's humanistic change of heart. The alterations made consist in a general toning down of the more ambitious and daring portions, with the substitution of the pragmatic point of view and its terminology for the older one when occasion demands it, while four substantial passages have been added on the nature of truth, the influence of personality in philosophy, and the hopelessness of absolutist metaphysics.

In "French Men, Women, and Books" (McClurg), Miss Betham-Edwards has confined herself to the nineteenth century, but her interest reaches from Edmond Demolins, the Anglophile and educational reformer, and the Université Populaire (People's University) to that great prose epic of the psychology of war, Paul and Victor Margueritte's "History of the Franco-Prussian War," and includes the famous friendship between the author Barbey d'Aurévilly and his publisher, Mary Clarke's (Madam Mohl's) parallel love affairs with Claude Fauriel and Victor Cousin; the correspondence between Balzac and Madame Hanska; and what the author considers "most vital, most living in French verse." Perhaps the most entertaining part of this book is the Postscript, "France Seen from the Outside," written in French and contributed by request to *La Revue pour les Français*, "the object of which is literary internationalization." Miss Betham-Edwards has done something worth doing, and she has done it extremely well. Her book charms and interests, adds to one's store of knowledge, and widens one's horizon. Moreover, it is handsomely illustrated and attractively bound and the type and paper are excellent; but either the proofreader or printer has been inexcusably careless. There are broken and misplaced letters, and words spelled so that they alter the meaning of the text.

Any excuse will do for a fresh dip into the social history of England or for another excursion among her villages and hedgerows, and no institution binds England so tightly, historically, and physically as the public house. Her politics, her religion, her economic development, and her temperament are here reflected. Those who read "Old Country Inns of England" (L. C. Page & Co.), by Henry P. Maskell and Edward W. Gregory, will learn why the "Bull," wherever it stands, is a relic of monasticism, why the "White Hart" is associated with the beginnings of England's middle class, and what Staple Inn meant in her commerce.

In his "John Bright" (Houghton Mifflin) R. Barry O'Brien does not appear to so good advantage as in his life of Parnell. He has neither the personal intimacy nor the copious original material to draw upon which he had in the earlier biography. This he frankly recognizes, and by calling his book a "monograph" at once notifies us that it is less a formal study of Bright that he is presenting than a series of sketches of varied aspects of that statesman's carreer. Viewed in this light, the volume may well serve the useful end of bringing freshly to the mind the character and activities of a great orator and a simple but intense personality, who played a leading rôle in his day, and made contributions to high political discussions which are still burning. Mr. Birrell's introductory pages resume the matter with sagacious humor, confronting Bright's ideals with the realities as we see them to-day, but agreeing that his heroic struggles for what he believed in availed him and his generation mightily, even if the goal still recedes with the years.

Sir Alfred Lyall, whose death at the age of seventy-six is reported from London, was the author of "Verses Written in India," "British Dominion in India," "Asiatic Studies," "Life of Warren Hastings," "Tennyson" (Men of Letters series), and "Life of the Marquis of Dufferin."

Science

Sturgis & Walton Co. promise this month "The Nervous Life," by Dr. George Partridge.

In "The House Fly—Disease Carrier," to be issued this spring by Stokes, Dr. Leland G. Howard insists that this insect should be exterminated.

"Science and the Criminal" is a book by C. A. Mitchell which Isaac Pitman is bringing out.

The Rev. E. P. Powell adds one more to his list of out-of-door books in his "How to Live in the Country" (Outing Publishing Company). Recent winters spent in Florida enable him to speak of Southern as well as Northern conditions. The volume discusses the more important aspects of the country-life problem, and though a bit repetitious, is simple and direct. There is never anything academic about Mr. Powell; he writes from his own experience, and is plain-spoken about the difficulties as well as the allurements of the farm. In telling how to choose the site, build the house, and prepare for the future of both farm and family, it makes an excellent companion to Professor Bailey's "Manual of Gardening," reviewed a year ago in these columns. The whole point of view is one of careful and economic management.

Quite different in this last respect is Mrs. Helena Rutherford Ely's "Practical Flower Garden" (Macmillan). While Mr. Powell counts the dollars, and spreads them thinly over his nine-acre farm, using as little hired help as possible, and looking for profit, Mrs. Ely in a garden of apparently similar size enjoys the luxuries of trained workmen, unlimited supplies, and the pursuit of beauty alone. Though without the excuse of previous magazine publication, her book is the more disjointed of the two, and as an example of bookmaking cannot compare with the work of the trained writer. But at bottom the two writers are one in a love of natural rather than artificial beauty, and from Mrs. Ely's pages the small householder will get the detailed directions which Mr. Powell does not always have space to give. That she also speaks from experience may be seen from the hundred pages devoted to the shrubs, vines, plants, and bulbs which she has successfully grown. The book is attractively illustrated.

Prof. H. C. Jones of the Johns Hopkins University has revised his book on the "Electrical Nature of Matter and Radioactivity," published by the D. Van Nostrand Company. A relatively large number of books on this subject have been written recently, which it is difficult to classify, since, though not really scientific in treatment, they require too much technical knowledge to be popular. This means, perhaps, that the class of semi-scientific students is on the increase. Professor Jones has been diligent in collecting material for his book, but he has not the sureness of touch of one who has worked directly on the subject. For example, the impression is given that the theory of electrons is due solely to Sir J. J. Thomson, and that it is a simple theory supported by all the facts discovered. Now it is quite certain that there has never been a more perplexing class of phenomena than this, and that many, besides Lorentz, Larmor, and Abraham, have contributed largely to the fundamental ideas of the electric theory of matter. Instead of one theory, a number of theories have been proposed which differ essentially. Nor would it be admitted even by those convinced that the electron is "pure electricity disembodied of matter" that such a statement means an acceptance of Ostwald's doctrine of energy. For even if the electron is not matter or a property of matter, it is still just as difficult to class it as energy or as a property of energy. It is, on the other hand, a pleasure to note the restraint which Professor Jones exercises when he discusses such problems as the transmutation of the elements, interatomic energy, and disintegration of matter. The book, as a whole, impresses one as a sober account of a very important development in science. It is generally more accurate as an account of the chemical side of the phenomena than of the physical properties.

Although there was surely no pressing American need of "The Amateur Astronomer" (Dodd, Mead), by Gideon Riegler, translated by George Aubourne Clarke, the book is not altogether valueless. Its author hopes it may be a guide for use at the telescope; but as such it is inferior to a number of predecessors which really do help the amateur with a small instrument to get one object after another into the field of his telescope. There are two convenient ways of doing this, and Riegler has nothing to say about either of them; he tells merely what one may expect to see after he has accomplished the often tedious task of catching the elusive telescopic hare. His explanation of the achromatic lens is erroneous and misleading. Overmuch space is given to a type of telescope not yet much known in this country, the "brachyt" of Fritsch of Vienna, which has the grand advantage of small size, but is very sensitive in use, and must need continual care and oft-repeated adjustment. The author's ideas about the excellence of observing sites are good, but the amateur, unfortunately, must use his little glass wherever and whensoever he can. There is a much easier and more accurate stellar method of establishing a meridian line than the solar one this author gives. His suggestions about learning constellations are useful, and the geography of the sky is made quite clear and easy to follow. Variables and doubles are well described with lists. There is a good chapter on the sun, and its eclipses are not forgotten. Clusters and nebulæ are well treated; and in a single line the writer disposes of the one crucial question concerning the ruddy planet: "*It snows and freezes and thaws, also, on Mars; that we know*" (p. 243). But, as if feeling that others might question this utterance, he reinforces it with valiant italics.

Even if Halley's comet had not returned, there was urgent need of a new general work on these interspatial wanderers. Guillemin's "World of Comets" of a generation ago is now quite out of date, and Watson's popular treatise had little currency. The gap is excellently filled by George F. Chambers's "The Story of the Comets, Simply Told, for General Readers" (Clarendon Press). Modelled on the comet chapters of his favorably known handbook of astronomy, this popular scientific writer has produced the best of all English treatises, meriting a place alongside Galle's "Verzeichniss" and other foreign works in this well-cultivated field. Chambers brings the subject down to the present, the frontispiece being an effective North African desert sketch of the daylight comet of 1910, as seen from Biskra. A third edition is already a desideratum; and it will no doubt contain the scientific results from last year's observations of Halley which are now in large part available. While in this country there was much public disappointment concerning this famous comet, on account of cloudy weather during the fortnight of its highest development, nevertheless astronomers were far from dissatisfied with their results; not the least, Mascart and Müller, who ascended the peak of Teneriffe, and Ellerman, who led an expedition to Hawaii, especially for the comet. Ritchey of the Carnegie Solar Observatory reports some marvellous photographs with that most powerful camera in the world, the sixty-inch mirror of his own construction at Mount Wilson, on which he finds that the clean-cut, filamentous streamers whose roots are in the nucleus exhibit relatively rapid fluctuations, with hourly changes of figure, somewhat simulating the momentary shifting of the streamers of the Aurora Borealis. And, according to Barnard's estimate, "Halley far exceeded all expectations as a spectacular display." Chambers devotes an entire chapter to Halley, and other chapters in his scholarly and critical fashion to all the varied phases of comet lore and investigation.

"The Open Air Crusaders," carrying on the cover an attractive color picture of a particularly "chipper" one of them, is primarily a report of the Elizabeth McCormick Open Air School in Chicago. It also contains much other information about such schools there and elsewhere, with various details concerning questions of

management, methods of ventilation, making of special clothing, and so on, all of them matters likely to be of interest to those who are engaged in solving open air and related problems in other cities. The book, of about one hundred pages and abundantly illustrated, is edited by Sherman C. Kingsley and may be obtained free of charge from the United Charities of Chicago, at No. 51 LaSalle Street, in that city.

Drama

The "Memories of a Manager" (Doubleday, Page & Co.), made up of the reminiscences and "random reflections" of Daniel Frohman during twenty-five years of active theatrical management, though written too largely from the business point of view to be very valuable as an essay on dramatic art—which, indeed, it does not profess to be—is, nevertheless, an interesting and instructive little volume, full of shrewd observation, practical information, and sound common sense. Mr. Frohman, a self-made man, occupies a distinguished position among the theatrical magnates of the day, by virtue of his unique experience in every detail of his profession, his intellectual ability, the cleanliness of his career, his decent standards, and his actual artistic accomplishment. His record in the two Lyceum Theatres, the Madison Square, Daly's, and elsewhere is honorable, and, on the whole, beneficial. He has produced many good plays, none either rank or vicious, has been associated with many of the ablest dramatists and players of his time, and has fostered successfully much literary and histrionic talent. His pleasant gossip concerning incidents behind the curtain, the making and remaking of plays, the accidents and inspirations of rehearsal, the ways of authors and actors, etc., will be read with eagerness by the unsophisticated layman, but need not be discussed here. His reflections are more important and significant. It could be wished, for no one could treat the subject with more knowledge or authority, that he had spoken more fully of the evils wrought by the present syndicate system. To these he only alludes. He admits, however, that the abolition of the old stock system has stopped the development of the art of acting, and expresses the hope that the old order of things may some day be at least partly restored. While maintaining that the primary object of the stage must be entertainment—which is in the broad sense true—he adds that the theatre should aim to represent life as it ought to be, rather than as it is. The essential qualities of the successful play he enumerates with expert precision. His dicta are not new, but are full of useful hints for budding dramatists. The financial failures of many prominent American actors in England he is inclined to attribute to insular prejudice. But there is another possible explanation, and that is that they landed there virtually unknown personalities. Eminent English actors, like Irving and the Kendals, have not been altogether strangers when they reached these shores. They had been advertised here by the American press, and the horde of returning American tourists. Elsewhere he intimates that Shakespeare is more popular here among the less educated than the more highly educated classes. This is only partly true, for Miss Marlowe and Mr. Sothern recently attracted vast audiences on Broadway, but insofar as it is a fact, it is capable of easy explanation. The crowds who flock to inferior Shakespearean representations are not students of the bard. They know him only in the theatre. The real lovers of Shakespeare, especially those who have once seen him fitly interpreted, cannot endure to see him butchered on the stage. And capable Shakespearean interpreters are becoming rarer every day. Mr. Frohman, who thoroughly appreciates the value of trained actors, doubtless will realize the truth of this observation.

Herbert Farjeon, writing in the London *World*, makes a plea for the institution of "a periodic dramatic festival in London, based substantially on the ancient competitions in the Dionysian Theatre, but differing, of necessity, in particulars. I suggest (tentatively) that the festival should occupy three weeks; that the first should be devoted to six tragedies, the second to six comedies, and the third to twelve one-act plays, and an award evening for the announcement of results and the delivery of speeches and special addresses by the winners of the contests. It should not be hard to induce the promoters of the forthcoming National Theatre to take the whole scheme under their wing; for the festival—which, I suggest, should occur triennially—is essentially national in conception, and should form a remarkable feature of every third London season."

Margaret Townsend, author of "A Modern Saint Anthony," "The Sword of Damocles," and "The Statue of Flesh," is writing a four-act drama, entitled "The Passing of the Idle Rich," founded on Frederick Townsend Martin's book of that title.

By agreement with Mrs. Patrick Campbell, Martin Harvey will soon revive Maeterlinck's poetic play, "Pelléas and Mélisande." According to his present intentions, it will be his first production in his forthcoming autumn tour. Afterwards it will have a prominent place in his repertory.

It is said that Herbert Trench means to give a revival of "Hamlet" at the London Haymarket Theatre, and that Laurence Irving will then make his first appearance as the Prince.

The Jules Samhon collection, which was one of the principal features of the Theatrical Exhibition held in the Paris Louvre in 1908, is to be sold at auction on May 1. It is very rich in costly, rare, and artistic objects, and is most varied and comprehensive in its composition. The catalogue begins with Greek vases, of which there are thirty-nine. The terra-cotta lamps are numerous and some of them very remarkable; they show scenes of cock-fighting, wrestling, combats with wild beasts, tragic masks, jugglers, performing animals, and many ancient views of amusements that are still in favor. Among the terra-cotta figurines there are some of exquisite beauty, some most forcibly grotesque, and some jointed, just as the modern doll is jointed. The earthenware masks are equally various and the bronzes—one of the most valuable parts of the collection—include pieces of rare beauty. The ivories, cameos, and intaglios are full of interest. Among the portraits are a fine Le Kain as Mithridate by Mme. Labille-Guiard, and the portrait of Malibran by Pedrazzi. There are also portraits of Goldoni, Dejazet, Raucourt, and Talma, while the miniatures include Eleonora Duse, Fanny Elssler, Josephine Grassini by Quaglia, Malibran, and Talma. There is also a great and valuable assortment of engravings, photographs, autographs, programmes, play bills, etc.

Jacob Wendell, jr., a member of the stock company of the New Theatre and a brother of Prof. Barrett Wendell of Harvard, died on Sunday at his home in this city in his forty-third year. Having shown uncommon histrionic talent in the Hasty Pudding Club at Cambridge, he began his professional career at the performance of "Antony and Cleopatra" with which the New Theatre was opened. He next played the dog in "The Blue Bird," and was to have appeared in the leading rôle of "What the Doctor Ordered" at the Astor Theatre last Friday evening.

Music

The Story of the Carol. By Edmondstoune Duncan. New York: Chas. Scribner's Sons. $1.25 net.

English Melodies from the 13th to the 18th Century. Edited by Vincent Jackson. New York: E. P. Dutton & Co. $3 net.

Old English Instruments of Music. By Francis W. Galpin. Chicago: A. C. McClurg & Co. $2.50 net.

Carols are inseparably associated in most minds with Christmas, and the French, whose singers have been particularly prolific in this field, have a special "Dictionnaire de Noëls." Mr. Duncan, however, uses the word carol in its widest sense, in which it is almost coextensive with folksong. The lullaby and pastoral are its oldest forms. He finds an approach to it in the personal panegyric, the individual ode, of the Greeks. He cites the testimony of St. Jerome that carols were in use in the fifth century. He labels "Sumer is icumen in," of which England is so proud because it is the earliest extant instance of polyphonic music, as a "spring carol." He devotes a special chapter to the secular uses of the carol, explaining that "in the vast bulk of Carolry, it matters not of which country, . . . a large part of such pieces originated with and belong to the people. They are a sort of folk-song, a part of minstrelsy, as distinguished from the music of the church." Yet, as a rule, the two meet half-way—the priest in holiday guise, the peasant inclined toward worship; and "no one can certainly say this is of the church, that is of the people." What makes it still more difficult to separate the two mentally is the habit of the mediæval church composers of using the old carols as suitable groundwork

for Nativity masses, motets, and anthems.

Sir John Stainer has expressed the opinion that the singing of carols, in the narrower sense of songs of Nativity, grew out of the mediæval mysteries. Mr. Duncan devotes a chapter to the "Marienlieder" from which the early carols drew their legendry, and another to the strange ceremonies and customs connected with these songs. His volume is richly illustrated with facsimiles of mediæval documents and with the words and music of dozens of carols, among which a Polish tune of the thirteenth century (p. 53) is particularly pleasing. A biographical appendix, a glossary of words, a chronological table, and a bibliography complete the volume.

Vincent Jackson's collection of English melodies includes a hundred well-chosen examples, from "Sumer is icumen in" to John Bull's "God Save the King." They belong partly to the type of anonymous folksongs, but most of them are by well-known composers, from Dowland and Campion to Charles Dibdin, Samuel Wesley, and J. W. Calcott. In explaining why Byrd is represented by only one song and Tallis by none, Mr. Jackson points out the main reason why old England is so far behind the continent as a producer of art-songs of the simpler kind: Byrd's vocal music "usually needs five voices to do it justice. The craze for madrigal-writing has robbed the song-world of many a priceless treasure." On the subject of folksong and its relation to art song, Mr. Jackson makes some sensible and timely remarks. He holds that no sharp distinction can be made between the two kinds (most of the songs in his book prove this); that inasmuch as two persons cannot share the invention of a melody, every folksong must have an individual creator, although the original air may be modified afterwards; and that though folksong often has a humble origin, it has oftener received its impulse from the cleverest inventors of the time. "All that is necessary for a folksong is that the people should sing it and make it their own."

In an appendix no fewer than 133 English song composers of the thirteenth to the eighteenth century are named. Of all these, Henry Purcell is most liberally represented in this volume. His elaborate art "first proved what the human voice could do with a well-developed air." Unfortunately, after him the art of song-writing suffered many checks. Every now and then the historian notes a grand effort in the direction of progress, then the wave of energy flags and fails. At the present day, the author concludes, English song-writers still have "a vast, if not unexplored, continent before them." English song of the nineteenth century is strongly saturated with foreign influences, from Mendelssohn to Wagner; but in the present volume one breathes purely British air—usually an atmosphere of gayety mingled with ecclesiastic strains. The music is printed with good type, and each song has an initial decoration by Herbert Cole.

In the preface to his new book on old English instruments of music Mr. Galpin laments the fact that England has no general collection, like that of the New York Metropolitan Museum of Art, where the lover of music can trace the evolution of his favorite instrument through the long ages of the past by a graded series of typical specimens. His splendid volume, with its numerous exceptionally beautiful half-tone illustrations, in which one can almost see the grain of the wood in the case of viols, harps, lutes, and guitars, might almost be called the equivalent for such a museum. There are fifty-four of these plates, picturing instruments in use up to the end of the eighteenth century; and most of the mediæval miniatures are different from those so often reprinted in the musical histories. While mainly concerned with the diverse crots, horns, harps, citterns, dulcimers, rebecs, viols, virginals, recorders, shawms, hornpipes, cornetts, organs, and other old instruments as far as connected with English life, Mr. Galpin, who is an authority on his subject, has gone to times most remote for their origin and traced their wanderings through countries far removed from the British Isles. A volume so painstaking and authoritative will be found to have its uses not only for collectors and antiquarians, but for ethnologists, historians, and writers of fiction with mediæval local coloring.

When Boston got its own opera company the announcement that the repertory would be limited to Italian and French operas was made with a certain swagger that seemed dissonant in a town made famous by an orchestra which plays chiefly German music. After two seasons of Italian and French opera, the second of which has resulted in a deficit of $135,000, it is now announced that German operas will be included in next week's repertory. Chicago, also, is promised plenty of Wagner, some of it in English. As for New York, Wagner was in the lead, as usual, during the season just ended, and the most popular opera was by another German, Humperdinck, whose "Königskinder" was sung eleven times at the Metropolitan, the nearest approach to it being Puccini's "Girl of the Golden West," which was heard nine times. Wagner altogether had 34 performances, Puccini 29, Verdi 26, Humperdinck 17. The number of German operas sung was the same as that of the Italian—fourteen. Of operas by French composers there were ten, including those contributed by Dippel, with his popular stars, headed by Mary Garden and Maurice Renaud. Next season, to give us a little more Wagner, Mr. Gatti-Casazza will revive "Rienzi," which, with its spectacular features in the manner of Meyerbeer, will appeal also to those who are not Wagnerites.

Henry W. Savage announces the engagement of Luisa Villani for the part of Minnie in his production of an English version of Puccini's "Girl of the Golden West" next season. She will alternate with Edna Showalter. Mme. Villani was born in San Francisco of Italian parents. In 1907 Gatti-Casazza and Toscanini engaged her for "Orfeo," "Otello," and "Meistersinger," in Milan, and since that time she has been heard in North and South America and Mexico.

Liszt festivals and concerts, in commemoration of the centenary of his birth, will be given in many cities next October. At Budapest there will be a series of concerts lasting from the 21st to the 23d of the month. The "Coronation Mass," given under the direction of Felix Weingartner, will take place on the morning of the first day in the Church of St. Matthew, and in the evening the "Legend of St. Elizabeth" will be performed in a scenic version at the Royal Opera House. The 22d and 23d are reserved for the performance of pianoforte compositions by Liszt, and among the concert-pianists who will appear will be Eugen d'Albert, Frederick Lamond, Moriz Rosenthal, Emil Sauer, Bernard Stavenhagen, and Mme. Sofie Menter.

Much new and valuable material bearing upon the life and character of Richard Wagner has been recently rendered available for a few persons who have been permitted to consult the Wahnfried archives in Bayreuth. The favorable facilities thus afforded for special research have enabled Julius Kapp in his "Richard Wagner, eine Biographie," the first volume of which has just been published by Schuster & Löffler in Berlin, to give a fuller and more accurate account of the celebrated composer's early career than that in any previous life of Wagner, and to throw a new light on many personal events supposed to be already well known. It is an octavo book containing 240 pages of text and 112 pages of illustrations. Unfortunately, the author is not a musician, and the second part of the work which treats of Wagner's musical compositions is far inferior to the first purely biographical part; it contains a number of palpable errors and strange misconceptions.

Art

Iranische Felsreliefs: Aufnahmen und Untersuchungen von Denkmälern aus Alt- und Mittelpersischer Zeit. Von Friedrich Sarre und Ernst Herzfeld. Folio volume, photolithographs; quarto volume, text and illustrative material. Berlin: Ernst Wasmuth.

A notable contribution to the history of Persian sculpture, and also of Persian architecture in early times, has recently been made by the publication of a royal portfolio of photographs, accompanied by a handsome quarto volume of nearly three hundred pages containing an examination and discussion of the characteristics of these monuments in stone left by the early Achæ-

menian kings and the Sasanian rulers of the Middle Persian Empire.

The huge portfolio that comprises most of the material which is made use of in the quarto, consists of photographs beautifully taken by Dr. Sarre during his journey through this part of Persia some ten years ago. Especially fine is the picture of the Tomb of Cyrus and that of the Tomb of Darius; particular mention should likewise be made of the plates portraying the monuments at Tak-i Bustan, near Kermanshah, in Western Persia; while those representing the various sculptured ruins at Pasargadæ and Persepolis serve well to supplement the two volumes of Stolze and Andreas, published long ago. The photographs of the rock at Bisitun, or Bahistan, on which the great historic inscription of Darius is chiseled, are highly picturesque. Striking is the one that gives the cleft in the mountain where the edict is carved, as it shows the rock at such an angle as to present the opposite wall as well as the inscribed face. On the other hand, the photograph of the sculpture of Darius and the rebels whom he vanquished was taken not on the lofty ledge but from the foot of the crag, and will not bear comparison with the successful photograph since procured by King and Thompson for the British Museum. How difficult it was to obtain a photograph on the ledge is known only to the few who have made the hazardous ascent to the dizzy height where the sculptures are hewn above the inscriptions. As to the inscriptions themselves, there still remains the feat for some venturesome young scholar of taking detailed photographs of each of the cuneiform tablets, panel by panel, thus supplementing the great achievement of Sir Henry Rawlinson, who transcribed them by hand. Such a collection of actual photographs would serve to complete the partial collation of Rawlinson's work made in 1903 by an American scholar, and the careful revision made a year later by the two Englishmen named above.

A noteworthy plate in the total collection of fifty-one in the portfolio is the next to the last—the photograph of a modern rock-hewn sculpture at Rai (ancient Rhages), near Teheran. This sculpture belongs to the early part of the 19th century and represents Fath Ali Shah with his courtiers about the throne. It is interesting as proving that this king led the way in disregarding the Mohammedan law against graven images, which had robbed Persia of the sculptural art for more than a thousand years. One or two of his successors ventured to follow his example, and, if once freed from a fear of iconoclastic fanaticism, Persia may some day again become a contributor to art through the chisel and the stone.

The quarto volume of text which accompanies the folio is rich in smaller photographs and reproductions to illustrate the various subjects presented. In this part of the work Dr. Herzfeld, who has likewise visited Iran, has admirably shared with Dr. Sarre in the task of describing and discussing the historic monuments under consideration.

Both of these able men are to be congratulated on their accomplishment. Not only that, but Germany is to be felicitated upon possessing enterprising publishers like the firm of Wasmuth in Berlin, who are willing to bring out such works, even at the risk of pecuniary loss, with the aim of advancing still higher the renown which German scholarship enjoys in the world.

"The Ideals of Indian Art," by E. B. Havell, and "Early Norman Castles in the British Isles," by Mrs. E. Armitage, are books in Murray's list.

Two volumes of the concluding portion of "The Domestic Architecture in England During the Tudor Period" will be issued by Batsford.

Stokes's art series have several additions this season. The Painters series has as new subjects Constable, Romney, Masaccio, Vermeer, and Metsu. Masterpieces in Color series now includes Corot and Delacroix, while brochures on Fra Lippo Lippi and Montagna will be ready in June. To the Great Masters series is added "Three French Painters of the XVIII Century—Le Brun, Chardin, and Fragonard."

"Blake's Vision of the Book of Job, a Study" (Dent-Dutton), by Joseph Wicksteed, is one of those books that require a patient reader. Mr. Wicksteed is convinced that these famous designs are not merely illustrations for the Book of Job, but so many hints of Blake's individual view of salvation. In general, we are told that both God and Satan are to be regarded as phases or projections of Job's own personality. Job's sin is spiritual pride and self-sufficiency. His deliverance, like that of Faust, is to be attained through experience. Citations from the prophetic give considerable color to this interpretation. Blake often is extravagant in thought and utterance, but he is seldom vague. It would not be surprising if his writings contained a system. Mr. Wicksteed seems to be capable of penetrating to the thought through the difficulty of the form, and we should welcome further studies of the poet-mystic from his hand. The present book appeals to lovers of Blake only. Others will find it hard reading. Good reproductions of the etchings accompany the text, and the quarto volume is well made. At times Mr. Wicksteed's explanations of the plates seem strained. For example, the simplest reading of the symbols at the bottom of illustration vi would be that they are the signs of decrepitude in Ecclesiastes xii—namely, the silver cord, the grasshopper, and the pitcher broken at the fountain. Mr. Wicksteed's suggestion that the broken pitcher is Job's potsherd seems both trivial and far fetched. In general, he has kept his head, and among Blake commentators this constitutes a rare distinction.

"La Pittura del Quattrocento" (Milan: Hoepli) is the first part of the seventh volume of Adolfo Venturi's monumental "Storia dell' Arte Italiana," and marks the middle point of the work. It treats the belated Gothic painters throughout Italy and completes the story of the Florentine school for the century. For its comprehensive ingathering of scattered information and its five hundred cuts this book must be in the hands of all serious students. Its very needfulness makes the more glaring certain defects of accuracy and judgment. We find especially the failure to explain the author's relations to his predecessors. For example, a special student of Botticelli will know that Professor Venturi, against such critics as Berenson and Horne, agrees with the late Hermann Ulmann as to the early work. But a novice cannot gather that fact from a bare mention of Ulmann's book in a bibliographical footnote. The failure to cite Ulmann's argument seems to us only less unfortunate than to adopt the view itself. These curious pictures with their unassimilated combination of the moods of Lippi and Verrocchio, are none of them of a quality to fit into Botticelli's work. Professor Venturi has better authority for seeing the hand of Masolino in the Brancacci Chapel. But neither he nor any other advocate of the Vasarian tradition has fairly met Schmarsow's objection that such backward work as Masolino's frescoes in the Baptistery of Castiglione d'Olona cannot have followed such advanced work as the Adam and Eve and the Tabitha of the Carmine. Eventually, we believe, scholars will have to come around to Crowe and Cavalcaselle's view that Masaccio alone is now in evidence in the Brancacci Chapel. On the very contentious matter of Leonardo da Vinci's early work our author takes the traditional view, regarding as Leonardo's an undefined portion of Verrocchio's Baptism and the Annunciation of the Uffizi. It seems to us clear gain to get rid of the gratuitous hypothesis that the tiny Annunciation of the Louvre must be regarded as Leonardo's earliest work. Such a position is tantamount to denying him a Quattrocento phase. For the Lichtenstein portrait and the Madonna of the Pink at Munich Professor Venturi suggests the convenient and plausible attribution of Lorenzo di Credi. Interesting novelties of the book are the demonstration of transalpine influence in the painting of Lombardy and the Marches. Especially interesting is the suggestion that those enigmatic masters, the Sanseverini, drew largely for their designs upon French miniatures of the late fourteenth century. Very oddly Professor Venturi fails to account for the fine and well-known examples of Fra Angelico in the Gardner and Johnson collections. As always Professor Venturi is good reading. These hints must suffice to convey some notion of the various interest of this very uneven work.

George Augustus Holmes and Frederick Daniel Harvey, both of whom died recently, were best known as painters of domestic scenes. Both were advanced in age, but were regular exhibitors at the Royal Academy.

Harry Fenn, artist and founder of the American Water Color Society, died last week at his home in Montclair, N. J., aged seventy-two. Born in England, he came to this country at the age of nineteen, and soon won considerable reputation by illustrating Whittier's "Snow Bound" and "Ballads of New England," which were among the first

of our illustrated gift books. In 1870 he made an extended tour to gather material for his "Picturesque America." Later he put forth "Picturesque Europe," "Picturesque Palestine," and "Sinai and Egypt."

The death, by his own hand, is reported from St. Petersburg of M. Kryzheisky, the landscape painter and member of the Russian Academy.

Finance

A FITFUL TRADE RECOVERY.

That trade activity has slackened throughout the country, and that the hopes of progressive revival, based on February's abrupt expansion, have not been realized in the sequel, are sufficiently well-recognized facts. They are facts, as usual, which may be fitted to a wide diversity of theories. Conversation about trade resembles conversation about the stock market, in that every one who engages in it is entitled to his own ideas on the subject, and will be respectfully listened to by the others. When people discuss a political situation or a religious situation, or even the condition of their own health, they are apt to quarrel, to talk in an angry voice, to break off friendships, and sometimes to come to blows. Not so in discussing the business situation. The "tariff-influence theory," the "cycle-of-prosperity theory," the "too-much-government theory," the "waiting-for-the-harvest theory," the "anti-Trust-decision theory," and the theory of the general cantankerousness of things, all have their innings as the undisputed right of the man advancing them.

The result, however, is apt to be a good deal of mental confusion, and a state of mind which cannot see the forest for the trees. In particular, the perfectly familiar fact is apt to be overlooked that, in recovery from a period of depression, trade does not surge forward in a sudden tidal wave of industrial activity, but moves by what seems, even if the general drift of things is reassuring, and even if each successive movement touches a higher mark of activity than the one before, to be only fits and starts. There will be buying movements in February which make every one predict that the turn has come; weeks of stagnation in April which inspire the idea that things are worse than before; new buying movements in July or September which cause fresh revision of ideas; another lapse into inactivity; and so it goes on until, if conditions really favor trade revival, the markets get fairly under way for continuous revival.

There is no mystery about this process; we saw precisely the same thing in 1908 and 1904 and 1897, and afterward we understood it perfectly. The explanation is that men in the thick of business affairs discover indications of undoubted betterment; that they all make the discovery at once; that they all lay in new supplies at once; but that they do not buy too much, because they know that the consumer is still a doubtful factor. Having stocked up simultaneously, they stop buying simultaneously, and simultaneously stand by to watch the course of distribution. This is the real philosophy of the fits and starts. When their new supplies have been worked off, they are seen again in the market at first hands; and in due course, if everything goes well, consumer and producer are moving along together and trade expansion is the recognized order of the day. But meantime all of us have our cherished theory to explain why everything does not happen instantaneously.

While merchants and manufacturers are taking this calmly judicious view of the situation, the Stock Exchange finds that its mind is free from cobwebs. Of that fact the past week has given an interesting illustration. A stock market such as has become familiar to us during the dozen past years would inevitably have moved in response to the incidents of the week on the Mexican border. It would have done so, not because the community in general was dismayed at the situation or because people expected war—they did not expect it, even when fire-eating correspondents of New York newspapers wired particulars of the Mexican government's perfidies. But action which would have precipitated war was possible during at least twenty-four hours, and the Stock Exchange did not display as much interest in the matter as the London or Paris markets would have shown toward news that the Russian government had asked what China proposed to do in Kashgar.

Perhaps, after all, the explanation of the market's indifference to Mexico is that people did not seriously believe that there was any cause for worry. But that, again, embodies a good deal of the philosophy of the present market, which seems in an unusual degree to be a market of common sense. We may be sure that, if things had really been moving as they were in 1898—with Legislatures passing war resolutions, yellow newspapers intercepting private and confidential letters of Spanish diplomats, Congressmen's wives with the American flag around their shoulders pressing to the front of the galleries of the House, and even the luck of accident throwing its weight into the scale—then the Stock Exchange would have been heard from. The market, indeed, anticipated much of that series of incidents thirteen years ago, and had completed its own panicky liquidation before the general public even knew that war was inevitable.

This is traditionally supposed to be the function of a stock market—a function which was no doubt fulfilled as completely by the apathy of the present week as by the excitement of 1898. But in a series of intervening years, we have grown accustomed to markets which acted very differently. If high financiers were deeply committed to a speculation for the rise, during the period in question, a situation like that of Tuesday of last week would probably have been accompanied by widespread tips that acquisition of Mexico would be a "bull point" of the first importance, and that this was only another reason for buying stocks. Or, if high financiers were themselves too tightly tied up to stir, and their antagonists were riding down the market roughshod, we should as readily have heard, through the news slips and the private wires and the man with his finger at our button-hole, that the Mexicans were across the border and marching on Galveston. For those, as a matter of fact, were markets which endeavored to sum up the news of the day, not in the light of financial common sense, but of common nonsense.

Whether the present sane view of things on the Stock Exchange is destined to be permanent or not, the contrast with the markets of those other not very distant days is at least refreshing. It suggests to mind the office which such a market can perform, and which it ought to perform in any properly-regulated financial community. That there are events not far ahead of us, on which we shall be particularly glad to have the enlightened judgment of financial markets, nobody doubts.

THREE LAYS OF MARIE DE FRANCE

SIR LAUNFAL, THE MAIDEN OF THE ASH, AND THE LOVERS TWAIN.

Retold in English Verse

By Frederick Bliss Luquiens

*Gilt top, $1.10 net.**

Poems by a French Lady of the Court of Henry II of England.

Dr. Luquiens says in his preface that these poems are "very charming, and resemble many a pretty woman who never takes a good picture—and therefore I have retold, not translated." He adds that his bibliography has been carefully " 'chained' at the end of the book, lest it terrify readers unscientifically inclined."

Henry Holt & Co. 34 W. 33d St. NEW YORK

THE
NEW NATIONALISM
By THEODORE ROOSEVELT

12mo. 268 pages. $1.50 net. Postage 12 cents

Mr. Roosevelt's declaration of his political faith and of the principles on which it is founded.

A book that marks a turning point in American political history.

The Baker & Taylor Co., New York

THE NERVOUS LIFE

By **G. E. Partridge**, Ph.D.

12mo. Cloth. $1.00 *net.*

Bad nerves are our national disease.

To preserve good nerves and cure nervous disorders are the aims of this practical, yet scientific, book, which tells the nervous man—especially the hard-worked man of sedentary ways—how, specifically, to order his life, how to eat, drink, sleep, and exercise, in order to keep or recover his physical well-being.

STURGIS & WALTON CO.
31-33 E. 27th St., New York

RURAL DENMARK AND ITS LESSONS

By H. RIDER HAGGARD. With 28 Illustrations from Photographs. 8vo. $2.25 *net.* [*Ready.*]

Mr. Haggard visited Denmark in the autumn of 1910 in order to study its agriculture, and especially the problems connected with coöperation, State-aided small holdings, and Credit-societies.

LONGMANS, GREEN, & CO., New York

Second Edition Ready.

ELLEN KEY'S *New Book*

LOVE and MARRIAGE

With a Critical and Biographical Introduction by Havelock Ellis.

CONTENTS:—The Course of Development of Sexual Morality. Love's Freedom. The Evolution of Love. Love's Selection. The Right of Motherhood. Exemption from Motherhood. Collective Motherliness. A New Marriage Law. Free Divorce.

From a Two-column Review in The New York Times:

"Thus you have a wise woman, mellow and singularly sane for the prophet of a new era, telling the truth as she sees it, and telling it in such plain words, taking account of things so intimate and delicate, that quotation in an article like this can be indulged only sparingly."

THE NEW DICTIONARY OF STATISTICS

By AUGUSTUS D. WEBB, B.Sc. (Econ.), F.S.S.

4to. $7.00 net.

This NEW DICTIONARY is a copious compendium of indispensable information on the international statistics of ECONOMICS, FINANCE, POLITICS, and SOCIOLOGY.

In addition to the Table of Contents at the beginning of the volume, a Detailed Contents-Table is prefixed to each of the longer articles. Tabular Headings, Footnotes, and other explanatory matter indicate the scope and limitation of the Statistics, and guard the reader from liability to misuse. A new System of Reference has been adopted, by which practically every figure in the Dictionary can be traced to its immediate source, thus providing the reader with a Guarantee of Authenticity and a Guide to further information.

IMPORTANT BOOKS ON TROPICAL FEVERS AND MOSQUITO INFECTION

THE PREVENTION OF MALARIA

By MAJOR RONALD ROSS, F.R.S., C.B.

Professor of Tropical Medicine, University of Liverpool, and Liverpool School of Tropical Medicine.

Illustrated. $5.00 net.

This work, by the discoverer of parasitic transmission of malaria by the anopheline mosquito, contains a short history of Paludism (malaria), a compendium of facts about the disease, its distribution, discusslons on various points, details, descriptions, and comparisons of the various antipaludic measures, a discussion of the cost, the antipaludic strategy and state policy, accounts of work done in various parts of the world and its results, and condensed accounts of the parasites, the mosquitoes and necessary technique.

HEALTH PROGRESS AND ADMINISTRATION IN THE WEST INDIES

By SIR RUBERT W. BOYCE, M.B., F.R.S.

With 47 plates from photographs, microscopic enlargement, plans, etc., and one colored map. $3.50 net.

This epitomized record of the progress of sanitation and sanitary administration, mainly in the British West Indies, is of vital importance to every health officer in the United States, the Philippines or the Panama Canal Zone, to every business man having interests in the tropics or the southern states and to every one having the amelioration of human conditions at heart.

MOSQUITO OR MAN

THE CONQUEST OF THE TROPICAL WORLD.

By SIR RUBERT W. BOYCE, M.B., F.R.S.

With 40 illustrations from photographs, microscopic enlargements, etc. $3.50 net.

A short history of the Tropical Movement in England and its subsequent expansion, together with an account of all the principal campaigns against Malaria, Yellow Fever, Tropical Anæmia, Sleeping Sickness, etc., throughout tropical and sub-tropical regions.

"There is probably no one who is more familiar with the conquest of the tropics for modern civilization by means of mosquito control and the prevention of malaria, yellow fever, and sleeping sickness by the destruction of insect germ carriers than Dr. Boyce. The book is therefore a capital first-hand authoritative account of actual practice, and not a second-hand compilation as are most popular books dealing with the subject."—*The Dial.*

READY SHORTLY

SIR RUBERT W. BOYCE'S New Book

YELLOW FEVER and Its Prevention

NEW CHEAP EDITION

AN INTRODUCTORY HISTORY OF ENGLAND

FROM THE EARLIEST TIMES TO THE YEAR 1815.

By C. R. C. FLETCHER, M.A.

IN TWO VOLUMES, With Maps, etc. $3.50 net per set.

Volume I. From the Earliest Times to the Restoration.
Volume II. From Charles II. to the Battle of Waterloo.

"Mr. Fletcher possesses an historical eye. He seizes at once the striking characteristics of eras and of men. There is hardly a line which does not arouse interest."—*The Nation.*

THE INCAS OF PERU

By SIR CLEMENTS MARKHAM, F.R.S.

Formerly President of the Royal Geographical Society and of the International Geopraphic Congress from 1894-1899.

Illustrated. $3.00 Net.

Apart from the suggestive remains of prehistoric peoples, the story of the rise and consolidation of the Inca power as told by Sir Clements Markham is a romantic and enthralling piece of history, while in his descriptions of the system of government, domestic life of the people, and so forth, he has had the advantage of half a century's research and discovery. He includes his translation of "Ollentay"—the sole surviving Inca drama—in the volume, as well as a love story, which is an interesting example of Inca folklore.

AN IMPORTANT NEW WORK BY THE AUTHOR OF "The Soil," "Fertilizers and Manures," etc.

THE FEEDING of CROPS and STOCK

By A. D. HALL, M.A., F.R.S.

Directory of the Rothamsted Experimental Station, Foreign Member of the Royal Academy of Agriculture of Sweden.

Illustrated. $1.50 Net.

An introduction to the Science of the Nutrition of Plants and Animals, embodying the results of the latest and most careful experiments in Soil-Feeding, Plant-Culture and Scientific Animal-Maintenance, as well as in Farmyard and Artificial Fertilizers, expressed in simple, direct language, and especially addressed to the young agricultural student and the work-a-day farmer, but interesting to every intelligent man and woman.

NEW BOOKS IN PREPARATION

MASTER CHRISTOPHER. By Mrs. Henry de la Pasture (Lady Clifford). Net $1.35.

I WILL MAINTAIN. By Marjorie Bowen. Net $1.50

20 Vesey St., New York City

LETTERS AND MEMORIALS
OF
WendellPhillipsGarrison
Editor of The Nation 1865–1906

In one volume, crown 8vo, 300 pages, with photogravure portrait.

During the forty-one years in which he edited the *Nation*, with a thoroughness, ability, and conscientious devotion unsurpassed in the records of American journalism, Mr. Garrison was an indefatigable correspondent, never employing an amanuensis, but writing tens of thousands of letters with his own hand to his contributors, who embraced practically all the leading American scholars and critics of the period. From a dozen groups of these, which have been kindly loaned by the recipients, a sufficient number of selections has been made to illustrate the relations between Mr. Garrison and his great corps of contributors, the frankness and tact which he exercised towards them, and the wide range of his interests, tastes, and sympathies. The volume also contains a brief sketch of his life, a dozen of his best poems, and several of his characteristic editorials, reviews, and essays, besides a fine photogravure portrait.

Important New Macmillan Books

READY THIS WEEK

THE NEW NOVEL BY THE AUTHOR OF "NATHAN BURKE"

The Legacy By Mary S. Watts

Few modern novels have given such lasting pleasure as one finds in "Nathan Burke," and the same discriminating observation of the human heart which made that book so uncommonly worth reading fills this new novel by the same author with the keenest interest. *Cloth, $1.50*

READY NEXT WEEK

THE NEW BOOK BY THE AUTHOR OF "THE VIRGINIAN"

Owen Wister's Members of the Family

This is the book you have wanted for ten years past—more stories of the vanished days to which belonged "The Virginian," "Em'ly," Lin McLean and Scipio Le Moyne, who, by the way, is the leading character in this volume.
Cloth, illustrated, $1.25 net; by mail, $1.35

OTHER NEW NOVELS, Etc.

Gustav Frenssen's *new novel*
Klaus Hinrich Baas
"One of the big, serious novels of the day that throbs with life."—*Graphic.* *Cloth*, $1.50.

Mrs. Roger A. Pryor's *novel*
The Colonel's Story
There is a vivid freshness of spirit, the genuine fragrance of the old South, in its pages.
Cloth, $1.20 *net; by mail*, $1.30.

Richard Washburn Child's
Jim Hands
is another novel which is steadily in demand, because of the sincerity of its insight and the humor of its recital. *Cloth*, $1.20 *net; by mail*, $1.32.

F. Marion Crawford's
Wandering Ghosts
A book which shows as no other does Mr. Crawford's ability to produce the delicate shivery suggestiveness of the successful ghost story.
Cloth, $1.25 *net; by mail*, $1.35.

Charles G. D. Roberts's
Neighbors Unknown
Direct and simple stories of animal life; forceful, picturesque, and sympathetic.
Illustrated cloth, $1.50.

The Book of Love
Introduction by **Madison Cawein**
An anthology which aims to avoid repeating the mass of lyrics to be found in numerous volumes, while keeping enough to be typical. But the selections in prose are its unique feature.
Cloth, decorated, $1.25 *net*, *in limp leather*, $1.35 *net.*

MISCELLANEOUS NEW BOOKS

Professor E. R. A. Seligman's
The Income Tax
"One of the greatest productions in the realm of public finance, this volume is worth the serious perusal of every student and every business man."—*United Banker.*
Cloth, 8vo, $3.00 *net; by mail*, $3.20.

Professor Irving Fisher's
The Purchasing Power of Money
Interesting discussions of the question of the causes of changes in the general level of prices, and the degree to which it is controllable.
Cloth, 8vo, $3.00 *net; by mail*, $3.20.

Dr. W. C. Bagley's
Educational Values
A capital series of applications of the principle that all education is essentially a process of modifying conduct. *Cloth, 12mo*, $1.10 *net.*

The Letters of Richard Henry Lee
A valuable series of letters collected and edited by Professor James Curtis Ballagh, Ph.D., of Johns Hopkins University.
Volume I, now ready, $2.50 *net; by mail*, $2.70.

The Practical Flower Garden
By the Author of "A Woman's Hardy Garden." With eight plates in colors and many illustrations in the text. *Cloth*, $2.00 *net; by mail*, $2.15.

Miss Molly Elliot Seawell's
The Ladies' Battle
A contribution to the discussion of "votes for women" which is arousing the liveliest interest.
Cloth, 16mo, $1.00 *net; by mail*, $1.10.

Published by THE MACMILLAN COMPANY 64-66 Fifth Ave. N. Y.

The Nation

NEW YORK, THURSDAY, MAY 4, 1911.

The Week

President Taft's speech in New York before the editors and publishers had a great success with his immediate audience and will, of course, carry nation wide and across the sea. In his appeal for Canadian reciprocity, he addressed himself mainly to the situation in the Senate. While he traversed familiar ground, he re-stated the arguments with both force and feeling. One point which he made has been too much overlooked. It is that the proposed agreement with Canada is not a policy which, once adopted, cannot be reversed if we see fit. The case is not of a treaty running for a fixed term and requiring due notice before denunciation. It is simply a legislative act which is contemplated and which can be repealed if it does not work well.

As it is a foregone conclusion that the Senate will accept the reapportionment bill passed by the House, it is desirable that the necessary action be taken promptly, so that those State Legislatures which are still in session may avail themselves of the opportunity to make whatever arrangements are called for in the way of redistricting. As for the basis itself, it was adopted for reasons that cannot be admitted to be sound, but which are always potent with Congress—the desire to have no State lose in number of representatives. As the rate of growth of population is different in different States, the adoption of this as a principle would, of course, have the effect of making the House larger and larger every decade; and the present would have been as good a time as any for calling a halt upon that process. However, there is good reason to hope that the disadvantage of the increase of numbers now about to take place will be far more than counteracted by the benefits that will flow from the change in the size and arrangements of the hall of the House. With the area greatly reduced, with desks removed and members no longer busy dispatching their correspondence and other business while Congressional eloquence is wasted upon them, we may hope for more reality about the House debates. If the *Congressional Record* were at the same time to be radically reformed—some tentative moves in that direction are put forward—the two changes together would make a vast difference for the better.

The unanimous decision of the Supreme Court sustaining the most ample rights of the United States Government in the control of the public lands of the nation furnishes ground for solid satisfaction. In one of the cases decided on Monday, the Attorney-General of Colorado appeared, on behalf of the State, on the side of the private litigant opposing the claims of the United States. He argued that no provision of the Constitution empowered the Federal Government to "conserve the national resources" by providing for a continuing timber supply, regulating the flow of streams, and preserving power sites from being monopolized. The Supreme Court admitted no such limitation of the discretion permitted to the nation in dealing with its possessions; in the Constitutional declaration that "Congress shall have power to dispose of and make all needful rules and regulations respecting the territory or property belonging to the United States" it found authority broad enough for all purposes which Congress, whether wisely or not, may deem desirable in the public interest. Thus one, at least, of the difficulties that might stand in the way of an effective national policy of conservation is forever disposed of.

Without pinning faith to all the details of the evidence that has come out about the men who financed Senator Lorimer's election, one thing must be considered as thoroughly established: the tariff was at the bottom of the corrupt use of money at Springfield. Again and again in the testimony does this fact crop out. When the representative of the Harvester Company was asked for $10,000 to help reimburse Hines, who said that the election of Lorimer had cost $100,000, the significant statement was made: "You are as much interested in having the right kind of man as we are." Of course, the "right" kind was the kind that would see that none of the tariff plunder was taken away. The same idea appears in what the chief witness before the investigating committee said the other day. He may not have been accurate or truthful in what he alleged about Hines's activities and admissions, but there is no mistaking Hines's motive. No Senator who would dare vote for free lumber could be thought of; the beneficiaries of the duty were bound to see that enough money was put up to prevent such a horrible result. It was simply the old clear case over again of making a large investment in politics in order to get a much larger amount back in the shape of protection. The tariff is a prolific mother—no race suicide there—and not content with being the mother of Trusts, is also the mother of corruption.

The latest legislative graft scandal comes from Ohio and bids fair to be of service to Gov. Harmon, who, it will be remembered, has encountered much mysterious opposition in his desire to obtain certain reform legislation. Three detectives of the Burns agency, arrested for offering a bribe to a legislator, announce that they have proof to lay before the grand jury that fourteen legislators have taken money from them for the passage of legislation. Their attempt to incriminate another Representative, Dr. George B. Nye, was what led to their arrest. Columbus has been as full of lobbyists and of rumors of undue influence this winter as Albany was last year. At the hearings on the liquor bill the city was crowded with representatives of the brewers, and when the local option bill was defeated by one or two votes, outsiders interested fairly forced their way on to the floor.

The conclusions embodied in Superintendent Hotchkiss's report, regarding the selling by life insurance companies of the stocks of other corporations still held by them, cannot easily be disputed. Mr. Hotchkiss flatly declares that, in his opinion, "there is not sufficient justification and no present need for the repeal of the mandatory sale provision, found in Section 100 of the insurance law"—the provision in the Act of 1908, requiring companies to dis-

pose of such investments. The reason for that requirement was perfectly understood when the law was passed; it was set forth in the report of the Armstrong Committee to the New York State Legislature in 1906. The practice of buying control of subsidiary corporations with charter powers denied to life insurance companies, the report explained, had "brought insurance companies into close relations with railroads, banks, trust companies, banking houses, and the flotation of new enterprises; thus involving them in the manifold transactions of the financial world, not in their normal relation as creditors through suitable investments, but as co-owners of the corporations and promoters of the undertakings to which they thus became allied."

Now, precisely this connection with other institutions was shown by the insurance inquiry to have been used as a subterfuge to evade the legal restrictions on investment of life insurance funds. To this practice the president of a great life company referred when he declared in a private letter, in 1903, that his policyholders' funds could not be placed in the attractive investment bargains of the day, although $36,000,000 of the company funds were then on deposit with institutions controlled through stock ownership. As a matter of fact this huge sum was already tied up in other engagements, such as trust companies might engage in, but life companies as such might not. This was the machinery through which most of the insurance scandals disclosed in 1905 were made possible. To have left that machinery in operation, after what had been discovered, might easily have rendered the whole programme of legislative reform a fruitless undertaking. That the three-year time limit placed by the law on the process of selling these stocks of other companies may have been too short, in the sense that the unfavorable markets of the period gave no fair chance to liquidate save at financial loss, is a more reasonable argument. It is so recognized by Superintendent Hotchkiss in his further conclusion that the real remedy for such embarrassments as confront the companies is "a substitute bill, providing for an extension of time within which the sale of existing holdings may be accomplished."

The scant space given in the daily press of this city to the death of Dr. Herman Knapp is but another proof that we have not come to place that value upon great scientists which is characteristic of older countries. Had he lived in Berlin or Paris the passing of Dr. Knapp would have been one of the great topics of the day, for his was a life of singular usefulness to the community, as well as to the science of ophthalmology, and there were few American medical men who rejoiced in wider renown on the other side of the water than did he. He studied at no less than seven European universities. He established a dispensary and hospital for eye diseases which is now a part of the University of Heidelberg, at which he taught for four years. Settling in New York in 1868, he became at once the foremost practitioner in ophthalmic and aural diseases and the founder of the Ophthalmic and Aural Institute, besides being a professor in the College of Physicians and Surgeons. More than that, the whole science of medicine is in his debt for the *Archives of Ophthalmology and Otology* which he founded, as well as for numerous treatises and text-books of permanent value and for his lasting contributions to the treatment of eye-diseases. But this is the briefest outline of an enormously busy and useful life. Never was there a doctor in New York who gave more generously of his services to the poor and the needy; to them he would go even late at night after an exhausting day's labor, if no other time was available.

If the negro wants to discover the regard in which he is really held by the Government, let him emigrate to Canada, where the arrival of two hundred colored persons has brought to the surface all the subtleties of the race problem. On the one hand, according to a dispatch from Ottawa, it is freely argued that the experience of the Southern States shows such immigration to be undesirable, and that it should, therefore, be prohibited by the Dominion. On the other, it is pointed out that the negroes are American citizens, and that the imposition of a head-tax on them, as on the Chinese, might arouse feeling at Washington. The difficulty with the two hundred was that, rigorous as the immigration officers tried to be, none could be refused admission. "All had money, all were in good health, and apparently of good moral standing." A similar party went from Oklahoma a year ago, and, displaying the same refractory disposition, have prospered and proved adaptable to the country. The matter is further complicated by the fact that Canadians pride themselves on their country's having been a haven for negro fugitives before the emancipation of the slaves. "It is seldom that negroes are excluded from hotels or subject to any other specific social or public indignity in the Dominion." But, of course, if any considerable number of them are going to invade the free lands of Western Canada, all this must be changed. Nevertheless, we venture to hope that the correspondent we cite is mistaken in his uncharitable suggestion that Canada's boasted toleration for negroes is explained by their scarcity.

Mr. Charles O. Ricker, who for three years fought in the battles of the civil war as a private in the One Hundred and Fifty-seventh Regiment of New York Volunteers, died yesterday at his home in Oneida Castle, N. Y. Mr. Ricker, never a man of independent means, distinguished himself subsequent to the war by refusing to accept for his services the pension which the government tried to thrust upon him His creed was that no man able to work should accept a pension.—[Press dispatch.

Surely if ever a man deserved a medal of honor it was Mr. Ricker. If Oneida Castle knows true greatness when it sees it, there will soon be a conspicuous monument on its village green to its most distinguished citizen. The firemen and the nearest militia company will parade, the Congressman will deliver the oration, and the village dominie will not only read from the Scriptures, but will, we trust, point out that, whereas many a man has won the iron cross for facing bullets, there is scarcely an American soldier who has looked a pension full in the face and refused to surrender.

After a recent study of the depreciation of motor-cars, the London *Times* comes to the conclusion that between 15 and 20 per cent. of the value of a new automobile ought to be written off as lost after the first day's run. Intrinsically, it finds, the car may be none the worse off and even better for a good "shaking-down" of the machinery; but it is second-hand from that hour, which

the *Times* feels makes newness a very expensive item in buying a car. This depreciation remains, however, about the same for the whole of the first year; in the second, 15 per cent. more should, it thinks, be written off from a $5,000 car —slightly less than is allowed by dealers on this side of the water, who take off about $1,000 a year on cars of the best American makes. The cheaper English cars ought to be regarded as deteriorating at about the same rate, it appears; so that at the end of two and one-half years half the value of a $2,500 car should have disappeared. The *Times* even works this depreciation out per mile per passenger, which it gives at from 3 to 5 cents a mile, according to the original cost, and this it thinks "a cost which cannot be considered excessive, considering the capabilities, comfort, convenience, and rapidity of the modern motor-car." Few automobile owners keep, we fancy, a careful account of the cost per mile of their cars. The *Times* thinks that for a first-class car it ought to be about 12 cents a mile; in this country, 17 cents or 18 cents would probably be nearer the mark.

At the Guildhall meeting last Friday, one London citizen named Herbert Asquith brought forward a motion in favor of the proposed arbitration treaty with the United States, and another London citizen named Arthur Balfour seconded the motion. There is a certain significance about the ceremonial that even the formal endorsement of arbitration by the leaders in Parliament lacks. The House of Commons represents the English nation, but the Guildhall is more apt to mirror the opinion of the man in the street. This meeting, therefore, showed that the peace idea has not only seized upon statesmen and high theorists, but has impressed itself upon such matter-of-fact people as London aldermen and lord mayors. If the sturdy British merchant can still be taken as the brawn and sinew of the land, here is that important class squarely aligning itself in behalf of peace. The British merchant is not given to soft dalliance in the lap of ideals. At present he is voting not for universal peace, but for a definite treaty of arbitration between two definite Powers.

Cabled accounts of the new bill introduced in the Commons for the prevention of crime by aliens, hardly did the measure justice. It does not at all propose to restrict the right of refuge on British soil from oppression and tyranny which foreigners have so long enjoyed. Nor does it aim to disturb in the least the great bulk of the alien population in England. As it was explained to the House, the chief object is to stiffen up the provisions of the existing law relating to the punishment of aliens convicted of crime. Since 1905, the English courts have had the power to add expulsion from the country to the sentence of any such convicted alien. But in practice it has been little availed of; and the proposal is that whenever a judge does not put that part of the law into force, he must state the reasons why he does not. The bill also makes more severe the penalty for aliens who return after being expelled for crime. A further provision is that if a complaint is laid before a court that a given alien is consorting with criminals or suspected persons, he may be ordered to give sureties. This could not operate against well-conducted political refugees, for, as Mr. Churchill said, "there has never been a time in this country when *bona-fide* refugees were not able to get two citizens to vouch for their good behavior." The enlarged act also proposes to forbid aliens to own or carry firearms without a license. There can be little doubt that the recent murders in Houndsditch and elsewhere by foreigners led to the proposal of this Government bill, yet there is no sign of panic about the measure, and its provisions seem to be moderate and not out of keeping with the traditional British policy.

University life in Russia during the last half-dozen years has functioned very imperfectly. In September, 1905, on the eve of the dawn of the constitutional era, the universities received large powers of self-government, the principal concession being the election of the rectors and deans by the university councils and the faculties. Oddly enough, these rights were left uncurtailed during the ensuing years of reaction and the nullifying of the constitutional régime throughout the country. The universities remained, therefore, virtually the only forum where the aspirations of the Russian people could find something like free expression. This state of things continued until last January, when the autonomy of the universities was, substantially, suppressed by decree. The rector and pro-rectors of the University of Moscow resigned in protest and were punished by being deprived of their professional status. Up to the present time nearly a hundred members of the faculty have resigned or been dismissed, and the oldest of Russian universities has virtually ceased to exist. Within student ranks there has been a division between radicals and moderates, the latter insisting on the exclusion of politics. But the motto, "Universities are for learning," which outside of Russia would be received as an utter commonplace, is opposed to the entire tradition of life in the Czar's Empire. Russia, in the mass, cannot conceive learning that is separated from the actualities of the day, just as it will hardly tolerate a literature or art without contemporary meaning or purpose.

The prospect of a tremendous change in the economic life of India, thinks the Calcutta *Englishman*, must now engage the chief attention of her publicists, especially her Viceroy. Great schemes for the compulsory education of the masses, and for the draining of every swamp, are all very well in their way, remarks this observer, but the important fact is that India is turning from an agricultural into an industrial country. In proof of this it points to the growing employment of gold, the release of hoarded rupees, the joint-stock banking, and the coöperative credit societies. Lord Hardinge has been sparing of his words in reference to conditions in his new field, and in closing the debate on the financial statement, he said merely: "If our Indian finance is to come through in safety, our watchwords must be caution and economy." This is enough, however, to satisfy those who feared the possibility of his countenancing some of "the wild-cat schemes which have been placed before the Council as the result of the fact that the credit of the Government is good and the treasuries overflowing." There may be a tendency among Englishmen resident in India to undervalue the "uplifting efforts," which they term "the unrest," but there can hardly be two opinions as to the wisdom, there as elsewhere, of Lord Hardinge's watchwords.

THE REPUBLICAN SPLIT.

Whereas, There is a division among the Republicans of the Senate, a minority of whom are known as progressive Republicans, to wit: Senators Clapp, La Follette, Bourne, Borah, Brown, Dixon, Cummins, Bristow, Crawford, Gronna, Poindexter, and Works; such division being well recognized in the Senate and throughout the country as based upon clearly defined differences on important legislative measures on questions of great public interest. . . .

This is the language, not of Democrats or Mugwumps, but of Republicans. An enemy hath not done this; rather, a familiar friend of the Republican party has lifted up his heel against it. For the words cited above are from the formal resolutions which Senator La Follette laid before the Senate Committee on Committees, demanding chairmanships and appointments on the ground of being virtually a separate party. There could not well be a franker or more public recognition of the wedge driven into the Republican party. It is not surprising that the majority, while refusing to comply with the request of the minority, viewed it with great concern as portending party disruption; and expressed the fear that "similar demands will have to be dealt with later in party conventions." Indeed, Mr. Ray Stannard Baker, writing in the May *American Magazine* on the insurgent Republican movement, declares that "it requires no very vivid imagination to see the progressives in that convention [the National Republican Convention of 1912], balked in their efforts to control the party, marching out of the hall to form a convention of their own."

For our part, we confess that it takes rather more than our portion of imagination to see such a coming event. Its shadow is too dimly cast before. We are aware of the fact that La Follette is a Presidential candidate, and that his friends are saying that he would bolt, or at least not support, the renomination of President Taft. It is added that he would not support, either, a Democratic nominee, such as Gov. Harmon. All this looks like a determination to flock by himself, which he may do; but that is a very different thing from predicting that any organized body of Republicans, much less the solid phalanx of twelve Republican Senators, would follow him out of the convention. The analogy tacitly in the minds of those who think this possible is the action of the Silver Republicans in 1896. They, it is true, under the lead of Senator Teller, "marched out" of the convention, but they were driven by an issue which was clear-cut and which they and their constituents believed to be absolutely vital. Can any man trace an equally sharp and deep-cutting line between the regular Republicans and the progressives? We think not.

Consider the insurgent Republican programme. From the beginning, the first item in it has been, as Mr. Baker puts it, "a much lower tariff." On this they made their great play in 1909 and all last year. But what has happened to them since? A practical step toward lowering the tariff has been proposed in the shape of the Canadian reciprocity agreement, and, lo! these progressive Republicans have been against it almost to a man. If one may judge by the proceedings in the House, they will almost as strongly oppose the bill for the farmer's free list. Most of them would assuredly be against the removal of the duty on wool. But this goes beyond mere inconsistency; beyond the appearance of settled hostility to whatever President Taft urges, whether it be the tariff up or the tariff down. It points to the fact that the insurgent Republicans would be wholly unable to formulate their tariff doctrines in a way either to solidify their own ranks or to make precise their dissidence from the tariff plank which the regular Republicans are likely to adopt in 1912. To break on principle, you must have a principle on which to break; and the most friendly but candid observer of the vacillations of the insurgent Republicans on tariff proposals would have great difficulty in pointing to any definite principle on that subject, unless it be that protection should be removed from articles which their States do not produce, but that any duty in which any constituent of theirs is interested can be touched only at peril of a political cataclysm.

The rest of their programme is also wanting in necessary divisive matter. They "believe in conservation," but what villain does not—in some kind? They are for postal savings banks, but they already have the beginnings of the system, thanks to President Taft. They believe in an income tax (which Taft and the regular Republicans are helping them to get), in a reform of the currency (ditto), in laws regarding pure food and public health (the same), and in "strictly regulating public utility corporations" (amen from the regular Republicans). Some of them also contend for the direct primary, the initiative, referendum and recall, but these are confessedly State affairs as yet, and not in the sphere of national politics, so that they cannot there be made the excuse for a party split.

To come close to realities, what marks off the insurgent Republicans from the others is something pretty intangible. It is an attitude, a temperament, rather than a body of political doctrine. If Senator La Follette were to blurt out his inmost feelings about President Taft and the existing leaders of the Republican party, he would say: "I do not like you. I do not trust you." That may be perfectly sincere and even justified; but it is impossible to think of a new party, or a bolting faction, being organized on any such sentiment. Political platforms have to go further than I do not love thee Dr. Fell, the reason why I cannot tell. Until we see something more than that, we shall go on doubting that 1912 will bring a definite breach in the Republican party. This is not saying that the present divisions and animosities are not ominous politically. A vague antagonism of personal dislike may be more deadly than separation on concrete issues. The fact, too, that a Republican President could not get the votes of half the Republican Representatives for the chief measure of his Administration indicates the fearful handicap under which the party is laboring only a year away from the National Convention of 1912. There can be no doubt that the vaunted Republican skill in "getting together" will be put to its supreme test next year.

A WELL-BALANCED CONSTITUTION.

Amidst all the applause that has greeted Gov. Wilson's magnificent legislative campaign, one good-sized doubt must have risen to plague thoughtful students of our political institutions. It is the same doubt that, in a much aggravated form, afflicted certain doubting philosophers all the years that Gov. Hughes was battling with the New York Legislature. It is all very well to have a reluctant or inofficient Legislature whipped into decency and efficiency by a resolute chief executive. But could a true lover of democracy really view with

satisfaction this method of legislative progress by propulsion from behind? The doubters we have in mind were under no illusions as to the character of a system whose fine flower was revealed in the Alldses, the Gradys, and the McCarrens. Yet overshadowing all the advantages to be gained or expected from an honest, fighting Governor towered the fear of what was going to happen to our governmental system of checks and balances if this sort of thing was allowed to go on. Were we not facing a species of Cæsarism? A benevolent Cæsarism, it is true, but still a Cæsarism. The existence of this doubt has been fully recognized by Gov. Wilson. Repeatedly he has been at pains to explain that his interference in legislative affairs was not coercion, but rather consisted in the removal of "outside" pressure on the Legislature, so that New Jersey's lawmakers might have the opportunity to live up to the very best that was in them.

In all frankness, this explanation of Gov. Wilson's strikes us as somewhat more soothing than it is convincing; and all the more so because any apologia of the sort is quite unnecessary. We may readily admit that it was the Governor's lash that drove the New Jersey Legislature to realize its higher, better self, and yet not admit that he thereby imparted an irreparable shock to our constitutional system. On the contrary, we discern in the situation signal proof of the resources that exist within the constitutional scheme to combat the evils that must from time to time arise within any constitutional order. No one will assert that in their struggles with the Legislature Gov. Hughes and Gov. Wilson resorted to tactics that would render them liable to impeachment. Both men got results by making use of legitimate weapons. Actually, it was one and the same weapon in the case of both men. They simply rallied to their support a great body of public opinion before which bosses and their henchmen were forced to bow. They brought into play their own great popularity against the great unpopularity of their opponents. If they coerced legislators, it was by proving to them unmistakably that the people of their respective States wanted what the Governor wanted. It is not on record that either Hughes or Wilson drove corrupt bargains or practised blackmail. They simply made the fullest use they could of their own constitutional powers. If that be treason, their opponents were welcome to make the worst of it.

The truth of the matter is that the tactics of a Wilson or a Hughes neither belie nor upset our constitutional theory of checks and balances. Undoubtedly the Fathers set out to establish government by equilibrium. But there is such a thing as stable equilibrium and unstable equilibrium. To-day we confront the latter condition. Under normal conditions, it is unquestionably desirable that the Legislative, the Executive, and the Judiciary should operate without interference each in its appointed sphere. But it is also desirable that when any one of the three departments of government grows derelict in its duty, when the perfect functioning of the machine is impeded by a breakdown in one of its constituent parts, first aid should come from one of the other partners in the constitutional scheme. We are far from contemplating with satisfaction a permanent state of things in which Governors shall bludgeon Legislatures into doing their duty. But the plain facts in the case are that the bludgeoning undeniably has to be done; and the Governor of the State, co-partner of the Legislature in the business of assuring the people a stable form of government, is by no means the worst person to undertake the delicate task of bringing the Legislature to its senses.

Is this the ideal way of repairing breakdowns in our government machine? Admittedly not. In the last resort, it is for the people who tolerate a misrepresentative Legislature to see to it that they shall not continue to be misrepresented. But we are not always a logical people and for the time being the States have fallen into the habit of looking to their Governors to save them from their Legislatures. This will go on until something like a real danger of executive usurpation arises. And then the people will set about electing efficient Legislatures to curb the powers of unduly ambitious executives. For the moment, the danger is not from executive usurpation, but from legislative inefficiency and corruption. And it is surely not detrimental to the Constitution that it should itself provide the means for setting the governmental house in order.

FRENCH IDEALISM.

The French Government has formally notified the Powers of its intention to intervene in Morocco. This fact will be immediately seized upon by the cynical observer and brought into juxtaposition with another bit of military news that has just come out of France —namely, the introduction by M. Jaurès in Parliament of his project for abolishing the present organization of the French army and putting in its place a sort of national militia intended solely for home defence. This is the way it always goes, our observer will say. The world talks universal arbitration and goes on building larger Dreadnoughts. The Czar calls the first World Peace Conference and prepares to throttle China and Japan. Great Britain preaches liberty and self-government and swallows the Boer Republics. France, in preparing the subjugation of Morocco with one hand, and with the other spinning fond ideals of an age that knows not war, is quite in the proper tradition. Nations, like individuals, are endowed with the salutary gift of hypocrisy.

The charge is more obvious than true. The hypocrite is rarely a sinister master of dissimulation. Much more often he is a man who is unable to see the incongruity of two opposite lines of action, a defect which in varying degree is common to all of us. The man who pilfers in Wall Street six days in the week is not necessarily the "real" man as opposed to the same individual in his pew on Sunday. He is most often a man unable to see himself as the Comic Spirit sees him. And so with nations. The England that builds Dreadnoughts is no more real than the England that has defended in the past and continues to defend the principles of individual liberty and individual conscience. The American people that was stirred to honest indignation in behalf of Cuba against Spain is no less real than the American people that allowed itself to be carried away into an unwise Imperialism. Subject as all people are to gusts of unjust passion and to the machinations of vicious rulers, they are not the predatory beasts ready to jump at each other's throats that newspaper cartoonists are fond of depicting. To society, as to the individual, we must allow its inconsistencies, hoping only that its good impulses outnumber the bad.

In the case of France we are at liberty to deny that the only real France is whatever complex of selfish interests may now be dictating the subjugation of Morocco. Just as real is the national character that reveals itself in a project like that of M. Jaurès. Actually this plan, visionary as it is pretty sure to seem to every practical statesman and military student, is straight in line with the traditional idealism of the French people. Every people subscribes to the safe doctrine of the brotherhood of man. But France alone, in our times, has produced men who have gone to the extreme of stamping the national flag into the dirt in behalf of the Republic of Man. Every nation piously discusses disarmament. But no nation has produced a political leader of repute to advocate the abolition of a standing army. It would be only partly true to say that the author of this revolutionary proposal is Jaurès the Socialist rather than Jaurès the Frenchman. There are Socialists in Germany, but when it comes to a discussion of Germany's war strength the German Socialist subscribes, though silently, to the militarist ideal. There are Socialists in Great Britain, but they are prudent, that is to say, British. The French temper is expressed in Jaurès's retort to Bebel's criticism of the violent tactics pursued by French Socialists: "You Germans have not died on the barricades."

M. Jaurès's bill provides that all citizens between the ages of twenty and forty-five shall contribute to the national defence, from the age of twenty to thirty-four in the active army, from thirty-four to forty in the reserve, from forty to forty-five in the territorial army. The "citizens" of the active army are to be recruited within definite geographical districts and are to be part of the army division assigned to that district. The "education" of the "active" army has three phases, preparatory instruction for children and adolescents, the training of recruits, and periodical "convocations." The preparatory education of children and adolescents, extending from the tenth to the twentieth year, shall not consist in "an apprenticeship anticipatory of military drill," but shall be, above all things, instruction in "health and suppleness," by means of "gymnastics, walking, rhythmic motions, games of agility and skill, and rifle practice." On reaching their twenty-first year, young men enter a school for recruits for a period of six months. Such schools are not permanent military units like the battalions and regiments of today, but just what the name implies, places of instruction upon graduating from which the citizen-soldier returns to become a member of his local military unit.

The new army is to be officered by men of whom only one-third shall be professional officers who have received a special training. The other two-thirds shall be chosen by a mixed system of seniority and election from among the non-commissioned officers, who, in turn, are to be selected from among the most promising recruits. One interesting provision: workmen's associations, such as labor unions and benefit and coöperative societies, are authorized to set aside funds for the education to the grade of professional officer of such workingmen's sons as have shown exceptional aptitude for the military profession. Another detail: while arms and ammunition are to be stored in local arsenals, in the Department of the East each soldier shall keep his arms in his own house. The Department of the East faces, of course, the German frontier.

But it is in the general declaration with which the Jaurès programme closes that the main interest lies. Articles 16 and 17 declare:

> The army thus constituted has for its sole object the defence of national independence and the national soil against all aggression. Every war that is not manifestly defensive is criminal; and it is unmistakably defensive only after the national government has invited the foreign government with which it is in conflict to submit the quarrel to arbitration.
>
> Any government that shall enter into armed conflict without having publicly and sincerely proposed a solution of the quarrel by arbitration, shall be regarded as a traitor to France, and to men, a public enemy of the fatherland, and of humanity. Any Parliament that shall consent to such an act shall be considered guilty of a felony, and as *ipso facto* dissolved. The constitutional and patriotic duty of citizens shall be to shatter such a government and to put into its place a government of good faith. . . .

In military circles, the world over, Homeric laughter will resound at this newest manifestation of French madness.

A "PURELY AMERICAN" ART.

In his article in the May *Scribner's* on schools and tendencies in art, Mr. Kenyon Cox refers to the "disappointment" of foreign critics at finding American painters so conservative. "Because we are a new people, the world seems to expect of us a new art, radically different in some strange way from the art of older countries." Almost as if in conscious confirmation of this, a special correspondent of the London *Times* now in this country, writing on "Painting in America," does the very thing that Mr. Cox describes. That is to say, he complains of the lack of a thoroughly "indigenous" art. He has pleasant things to say of our artists, especially in landscape, but laments their failure to seize upon distinctively American subjects. These, he says, appeal strongly to every foreign artist visiting the United States, yet the Americans unaccountably pass them by. "The negro is not utilized, neither is the Red Indian." In the recent show of contemporary American art in Washington,

> There was hardly any attempt made to make use of the intensely pictorial qualities of modern industrial America, nothing of the splendid glamour of great furnaces, no idealization of the Titanic forces of machinery; no nocturne of Pittsburgh, of the Chicago River, of commercial Philadelphia, or the New York water-front; no vision of mine or workshop or factory.

In so far as this is a demand that American art shall smack of the soil, be wholly original, inventive, daring, bizarre, it is only of a piece with the similar demands so often made by foreigners upon Americans in the province of literature. Your Bryant or Longfellow is all well enough in his way, but what we want is a poet who will typify your prairies and mountains and rivers and great sprawling democracy. There is Whitman, now; he does the queer things we are looking for, and that perhaps is the reason he is more popular in England than in his own country; but we wish to know why you don't give us others like him, or even more revolutionary than him? In architecture, too, there is the same yearning for something "purely American." But on this point there is nothing to add to what Mr. Kenyon Cox says:

> If we go on doing the classic thing in architecture until its language has become natural and easy to us, there is a possibility that we may begin to use it originally, and to produce, almost without knowing it, a national style. If we strive for origin-

ality now, there is little hope of anything better than the architectural chaos that we have had so much of.

Our British critic, however, is wide of the fact in supposing that such material for the artist's brush as he refers to has been overlooked by American painters. There has been no lack of recognition of the paintable qualities of negro and Indian, cowboy and roustabout; nor have there been wanting canvases depicting water-fronts and iron-works, slums and factories. If there are fewer of them to-day, the reasons are plain. Such subjects possess the charm of novelty to foreigners, but not to natives. Hence if their appeal is only by virtue of the unusual, it must necessarily be received coldly by the American art-patron. And artists "must live." If their purchasing public is not of the mind of the foreigner who is so eager for what is new and "characteristically American," there is no sense in producing that kind of work. Besides, even for art value and the benefit of the painter himself, there has come to be, as Mr. Cox remarks, a perception of the fact that it is not well to "strain our invention in the effort to discover some new spice for a jaded appetite." And if American artists are more and more abandoning the idea of a native "school," with marked eccentricities or mannerisms, and are more intent upon the task of making themselves continuators of the great tradition in painting, that fact is full of promise that we shall have an American art worth while.

The sound doctrine is admirably stated in Mr. Cox's article. Neither in art nor in literature must we think to get better bread than can be made of wheat. Anything that is straining or convulsive, in the aim to be original, is only an instance of the folly which Burke spoke of as depending more upon invention than experience. So we hope that American art will continue to disappoint foreign critics who expect it to be fantastic and audacious and unlike anything in the heavens above or the earth beneath. If our artists can enter reverently into the heritage of the past and live in its best spirit and add little by little their own interpretations and make their slight additions or variations, they will do more to create a veritable national art than they could by wild experimenting and sensational innovations.

SCIENTISTS AND THE MASSES.

"All Planets Inhabited, Says See—Not Mars, Says Aitken." This is a typical newspaper headline relating to the doings and sayings of scientific men There is nothing specially wrong about it; it indicates as well as could be expected the story that comes under the head. But it would be an interesting study in sociology to find out what is the net impression that the reading of the newspapers leaves upon the popular mind as to the character of scientific thought and the nature of scientific men. Many a candidate for the degree of doctor of philosophy in the social sciences expends his time upon less rewarding material. And the research would have the extremely rare recommendation of furnishing results that would be sure to be at least as entertaining as they were instructive.

Our investigator could perhaps do no better, for a start, than to interview a random lot of the "plain people" on this very matter of Professor See's lecture at Philadelphia and Professor Aitken's lecture at Berkeley. "Professor See," we are told, "laid especial stress upon the proof now deduced that planetary systems similar to our own revolve about all the fixed stars and that these planets are habitable and inhabited like our planets, which revolve about the sun. He said life was a perfectly general phenomenon in the universe and that living beings exist wherever a star twinkles in the depths of space." How does Professor See know this, or how does he come to think he knows it? Is this simply a personal opinion, reflecting his general notions of the universe, or is it a result of scientific research? Is it likely that by some miraculous stroke of discovery one person has been able to find out that life actually flourishes in countless planets whose very existence is only a matter of inference, when even in the case of our very near neighbor, Mars, it has not yet been possible to settle the comparatively gross question of the "canals"? Questioned on these things, it is highly probable that the ordinary man would not prove to be in a much more enlightened state of mind than the man who said it didn't surprise him that astronomers could find out how far off the stars are, or how they move, or how big they are, but what puzzled him was how anybody ever found out their names.

The sources of popular bemuddlement in regard to science are many. One of them, which lies on the surface, is the inevitable imperfection of the press reports of what scientists say. Professor See, we may surmise, made no such flat and positive statement as is given in the press dispatch. Another source of confusion arises from the fact that an astronomer, or a chemist, or a biologist is a man besides being a scientist, and has the common human weaknesses and failings. When he addresses a general audience, he is prone to forget the principles of scientific doubt which he respects as a worker in his own particular field. Some forty years ago, when science was thrilling with the new impulses that came with Darwinism and the doctrine of the conservation of energy, and spectrum analysis, and "the new chemistry," it was but natural that the world was inclined to look to it for light upon questions far wider even than these, and that some of the conspicuous representatives of science were ready enough to assume the robes which it was thought theology was on the eve of casting off. That sort of thing has gone decidedly out of fashion, but traces of it are still to be found; and, while there are few scientific men who imagine themselves entitled to speak with an accent of authority on the existence of God or on the immortality of the soul, there are not a few who confidently lay down the law on matters of human interest which lie almost as far beyond their province.

A better understanding of the nature and limits of scientific knowledge might exist among the people if, beside the "plebification" of science that is given by newspaper fragments, there were still going on that real popularization of science which had its period of efflorescence thirty or forty years ago. It had its faults, as we have said; but in the main it was a wholesome and educative influence. To listen to a course of lectures on light by Tyndall, to hear Huxley tell of the nature of protoplasm or explain what the Darwinian doctrine really is, to have the meaning of conservation of energy expounded by Helmholtz, was to get, not indeed mastery, but at least some kind of comprehension of what science is and a great deal of real sympathy with its aims and methods. And what the great masters of popularization did superlatively well

was done efficiently also by scores of others. In many minds, to be sure, there were awakened vague hopes that through science we were to have a new heaven and a new earth; hopes the disappointment of which was the theme afterward of such lucubrations as Brunetière's "Faillite de la Science." But science had not gone into bankruptcy; it had never made the promises which it was alleged to have broken. Its real history, in the past half-century, as in the centuries before, has been one of steady striving toward such truths as can be extorted from the physical universe by patient inquiry; and never have its discoveries been more abundant or more valuable. But the fitful glimpses of the new lands which the world gets in press dispatches are quite as likely to be mere mirages as anything more substantial.

THE NATIONAL ACADEMY OF SCIENCES.

WASHINGTON, April 23.

The annual spring meeting of the Academy has just been held (April 18-20), in the splendid new building of the National Museum, with three business sections, and three afternoons for the reading of scientific communications. These comprised three papers on astronomy, one on mathematics, one on meteorology, six on geology, mineralogy, or palæontology, four on biological subjects, and three on anthropology and ethnology. Thirty-one titles appeared upon the programme, making it unusually long. No paper on physics or chemistry proper or botany was read.
